This kinde of Shepheards needle bath stalkes of larger leaves than the wilde Carrot comming somewhat neare to Parsley, smooth, and of a pale greene colour, thole that grow at the joynrs of the stalkes come forth out of a broad filme or skinne, as is seene in many ferulous and umbeliferous plants, and bearing at the top a round head, of many greenish white thredes set close together: the roote is like the wilde, Parisippe, and of a bitter and sharpe taste.

2. Scandix Cretica minor five Anthrifcus. Small Shepheards needle of Candy

The small Shepheards needle of Candy hath sundry Stalkes of very fine cut leaves, not bushing thicke like

3. Scandix Cretica minor five Anthriftm. Small Shepheards needle of Candy.

4. Scandix Cretica majar. The greater Shepheards needle of Candy.

Miss 8. Affihitmore sparsed and thinne, comming somewhat neere to Camomill, but finer and a little hairy, of a infinition for and tafte, among which rife flender short stalkes, somewhat hairy or hoary, with but few that but letter and takes on them, at the toppes whereof fland five or fix fmall white flowers close fet together confifting one twee on the middle whereof is a darke purplish file or leafe longer then the rest, spreading for large peece, at the which follow long feedes like the first but finaller, bigger below and ending aforther they be rine, which are the feeder should be a little purplish as the bet involunt points, who is eaged at a more rough and terms incredented, and bee a little purplish as the page are before they be ripe, which are the seedes themselves: the roote is small long and white. This hath page defined to have a better sent that growth in untilled voyee and gravelly grounds then that which growchia the fields. 4. Scandix Cretica major. The greater Shepheds Needle of Candy.

The greater kinds hath a crefted fmall ftalke a cubit high, parted into divers branches, a little hairy at the very The great announced by the lower leaves broade and formewhat round, divided like unto the leffer Burnet Saxifrage one fet murate the control of opone memory regions are much more finely cut in, and like unto the leaves of the first, the umbed are a little spread and at injuries when the first, which are succeeded by more from colony round denied (seeds the the last basing and proper then the first, which are succeeded by more store of long rough dented seede then the last, having and then two small prickes at the end : the roote is small and fibrous.

The Place and Time. The fifty oweth plentifully in our owne Land among Corne: the second in France, the third both in Candy and Reputallo, and the last in Candy: they flower early and seede accordingly.

The Names.

The Greekes call it start & and the Latines Scandix also, and Petten Veneru, Acus Veneru, and Acus pattoris or and and some call it Scanaria. There is much doubt and controversie among our later writers, first what herbe is sealing of Diescevilles, Gallen and Pliny should be, that was so common a Saller herbe for the people to seede candgowing wilde with them, fo that Aristophanes merrily taunted Euripides the Poet, that his mother fold not true wort but Scandix, which was accounted the meanest or vilest of all others, for our Petten Veneris is not niembethe true Scandix in Candy, as Honorius Bellus fheweth in his first Epistle to Clusus; for he there faith the Continuente it not, calling it a year of lines, and hath no fmell, but another which they call Transline Sandici, and incleth well, but moveth nothing to Venery: divers therefore doe thinke that the Gingidium of Maribilm should be Scandix as Lugdunensis setteth it downe, Columna taketh the Caucalis echinato nodoso semiwhich how farre they are from veritie or almost any shew of reason this one thing doth declars than either Marthiolus his Gingidium nor Banhinus his Cancalis were ever used to bee eaten as Scandix was nor slitely to grow fo familiarly in Greece as Scandix fo wilde a wort ; but if I might spend my opinion in the matter, I should sooner believe Bellus his judgement hereof that lived long among the Gracians, (for I accome the Cardious in speaking Greeke and using the Greekish rices, to be as it were the off spring of the Greeks) and some both their denominations of herbes, and the use of them besides his owne both reading and observation; bolingthe ancient Greeke words although somewhat corrupted, who sheweth that Scandiki as they usually culin habe that they eare should be the true Scandix, then eyther Matthiolus or Columna, whose opinionative conclustrat he had found out the genuine plants of the ancients, made him runne farre awry in many things, as baybekenein his Hyffope, Polium and divers others the like: fo that my opinion is that our Petten Veneria is not the true Standis of the ancients, but a kinde of wilde Chervill, and not nied to be eaten with them or us, as the popule, also do declare sout that Seandics which they in Candy (and as it is likely throughout all Greece also) doe the madale for their foode is the true Scandix which we have seldome seene or knowne : next what Anthrife at of Play houldbee, whether this of Honorism Bellaw Sent to Clufism, or that of Columna in his Chapter of Scandix, withluke to be our Petten Veneree, and whether Bellus his correction of Pliny his description be not true which copartithe matter throughly. Ambrifous faith Pluny were the same that Scandix is, if it had thinner and swamkares, which reading being admitted, Authriform is an herbe that hath broader leaves and not so sweete in facil is Scandix, which Calumna as it should seeme would have to be the Scandix of Dodoness, and is our Petten Vami, which Columna commendeth him fo much for his true description thereof, and so would make our han Vernit to be the true Seardix of the ancients, which is neither fweete nor used to be eaten, and all this is Impost because he would have his Anisomaratorum to be a new plant of his owne finding, and not the Anthrismolling, as others before him had judged it to bee, when as his description of Anisomarathrum sheweth it make seeies of the Scandix by the france of growing and the forme of the feed-but admitting Bellus his correlated Biny that Authorem were the fame but that it hath finer and (weeter leaves, it endeth the whole convente, putting all things without doubt. I am somewhat more ample and tedious in the explanation of these they then I thought tobe, because they are intricate and various : the first here is called Scandix by divers authan, and Pellen Veners by others without doubting or questioning whether they were true or no : the second Lightnife remembreth, and the last Bashinss onely hath made mention of : the other I have. I hope sufficiently

The Vertues. Both Disferides and Galon fay that Scandix is somewhat sharpe and bitter, being hot and dry in the third demadthereby is good both for the fromacke and belly being eyther eaten raw or boyled : being made into distinct taken it is good for the Liver, backe and bladder, provoketh Vrine mightily and freeth the inward multionobilitudions: it also bindeth a loofe body, the feede being taken with vinegar prefently stayeth the ition and used in an oyntment it helpeth the parts that are burnt with fire : Pling faith that the roote of Petten Partibeaten with Mallowes draweth forth splinters or any other thing sticking in the flesh. Honorius Bellus the Ambrifem is used in Gandy by the people with great delight, not onely because it is pleasant to the taste, between it mightily provoketh to Venery and helpeth those persons that are weake or spent therein, and helwhwomen to conceive in that it clenfeth the feminary parts.

emetholisto be called and taken to be the Anthrices of Pliny which Baubiness calleth Scandix cretica minor.

Chap. XXIII.

Coriandrum, Coriander

He ancients formerly knew and fet forth but one fort of Coriander, and fayd that it had so dreffee but the later writers have added two more unto it as shall be shewed. 1. Coriandrum vulgare. Ordinary Corianders.

When Coriander first springers uniques of comments of the united parties of the united p round ftriped hollow feede of a whitish yellow colour when it is ripe: the roote is small and periheberer yeare after seede sime: the whole plant, seede and all while it is greene and growing hath a strong and long. fome favour scarse to be endured, but when the seede is full ripe and dry it is of a reasonable good sext and relative without offence.

2. Coriandrum minus odorum. The leffe fweet Coriander.

This Coriander hath the lower as well as the upper leaves all finely cut in and jagged, the stalkes gow lower not halfe a foote high, and lying almost on the ground, with white flowers on them and round feeds at the other but fuller and greater, and two alwayes joyned together.

but fuller and greater, and two alwayes joyneu togetner.

3. Corianderum færtidiffimum. The stinking Coriander.

This other Coriander hath sundry small stalkes that are five square being firme, and not hollow, not growing high, all the leaves whereof are as fine as the uppermost of the sirst; at the toppers of the stalkes stand ich ale imall umbells of purplish white flowers, after which come round feede like the other, but two always joyned together: the roote is great dying yearely as the other, the finell hereof is more from and officialty then the other to the head and fenies.

The Place and Time.

The two first are onely sowen in Gardens as well now as in ancient times, for Pliny faith it is not found wide. their naturall places being not knowne : the last was sent from Bareinona to Lyons by Mycomm to Melinem, who hath fet it forth in bistoria Lugdunensi : they doe all flower in Inly and ripen in August.

The Names,
It is called in Greeke xberor and xoplaror, and fo in Latine alfo Corion and Corionon, but infually Corionom, and derived from x6gue, which is that kinde of noyfome flie or worme that is called Cimen in Latine, a wall Long or Punie in English, whose stinking smell Coriander doth much imitate. There hath beene formerly some controversic betweene Avicen and Galen, and others also about Coriander, some condemning the use as hartfull and dangerous by reason of the grievous smell, and that it maketh the voyce hoarse, procureth a kind of frence

> Coriandium vulgare. Ordinary Coriander

· 2. Ceriaudrum alterum minus ein The leffer (weete Coriander,

TRIBE 8. Beauto drunkernnesse, and that the juice thereof being drunke capseth death, and that it is very cold, all these proposes the dradius Physicions give it: the correction therefore of the seede they appoint to bee by seeping it moves the dradius physicions gave to be safety inset to be seeded they appoint to bee by seeping it is the content to result this preparation, saying the conduction of the Vinegar canadraw forth none of the soule and stinking spirits from it, but rather the dry-dark conduction of the same seed as it is used when they are made into Comfits, without any other preparation and ignited the same seed of the same design tours among many countrey people of it felfe without preparation; and some commending the use bemissioner among many behind a warming, fweete and no noylome finell or take the noylome vapours fubshe only in the moynture and not in the drying, as wee may fee in many fruits which being not ripe are for the last high that fearfe one can ease them without harme, but being ripe are both mellow and sweetes, heate with white this effect: the hotter countries for the most part giving the mellower and sweeter fruit. The first is delty all writers Geriandrain, the second is mentioned by Lobel, and Dodonem giveth the figure without highly all writers Geriandrain, the second is mentioned by Lobel, and Dodonem giveth the figure without highly all writers Geriandrains onely remembreth the last. The Arabitus call it Casherra and Elcosur, the Italians Containing the Spaniarist Calantro, the French Coriandra is the high and-low Dutch Coriander, and we in English Contains and Collander.

Figitor greene Coriander and the cooling qualitie thereof: the juice as is before faid being drunke killeth through the state of the property market and botches riling in the skinne or flesh, and taketh away the swelling and inflammation of the cods. charles juke or greene herbe applyed t the juice thereof made into an ointment with Ceruffe, Litarge Vine-than doyle of Rose doth the like, Now for the dryed seeds of Coriander which is most inuse, and being taken in the wine killeth the Wormes in the body and encrealeth coiture: it is also good against the Serpent that is states wine kinetit the women in the body and collected to the street control of the florance of layd to the bitten place; it is very comfortable to the florance, by heatin g salwing, the cold and moifture thereof helpeth digettion and represent the vapours therein that rise upwards, admitted forcible paines of the winds chollicks and the flopping of Vrine; and being a nourishment of a tempracegulitie it helpeth to encrease both blood and Sperme.

CHAP. XXIIII.

Caucalia. Baffard Parfley.

these Canealides I have above a dozen forts to expresse here in this Chapter, some whereof have small fine cut leaves, others are larger and broad, some well knowne of a long time to many, and others of later invention.

1. Cancalis villgaris floribus albis. The common Bastard Parsley.

This Bastard Parsley riseth up with a short stalke, not above halfe a yard high, set at the joynts with which rough diverfly cut leaves smaller then Parsley, furnished at the toppes with small sweete umbells of whichowers, the ontermost being the greatest, after which succeede divers rough prickly round seede, two al-

2. Cancalle Hiff anica. Spanish Baltard Parsley.

This Spanish kind hath divers crested rough stalkes and leaves very like unto the former, but the umbells of whithours are smaller and growing more round together as it were into the forme of a round head, and the south this followeth is greater very much striped and rough but not prickly as this, it being broken in any prigreth a fweete milke : the roote perifheth after feede likewise but giveth no milke.

3. Cancalis major flore fature rubente. Deepe red flowred Bastard Parsley.

Third flowred kinde hath larger winged leaves then the former, being divided and cut in after the manner of tekin Burnet Saxifrage leaves : the flowers hereof are larger then of the first and of an equali bignesse, but of a deepered colour.

4. Caucalis maxima. The greatest Bastard Parsley.

This greatest kindebringing forth many upright tall stalkes three or foure foote high or more sometimes, being added and bollow within with divers joynts on them, and the stalkes of the long and large winged leaves complus the bottome, which leaves are large almost like Angelica leaves, fet by couples on the middle rib additione at the end, all of them finely dented about the edges, and of a darke greene colour; at the toppes white lakes grow large umbells of white flowers, somewhat purplish or of a blush colour underneath, after which me very large and flat rough feede, with a double point at the head and prickley, round about the roote white and wooddy

Cancalin Anglica flore rubente. English Bastard Parsley with reddish flowers. The English kinde groweth about two foote high, of an Olive greene colour, with a firong round crefted rough the groweth about two foote high, of an Olive greene colour, with leaves three or foure inches long, which are two or three inches in funder, with leaves three or foure inches long, which are two or three inches in funder, with leaves three or foure inches long, which are two or three longs for the complete former than deputy denied about the edges, the conting of feaven or nine narrow hairy leaves fet by couples, fomewhat deepely dented about the edges, the tone of the stalke being a broad thinne skinne or filme, and from betweene it and the stalke come forth lesser biteref leaves, towards the toppe parted into three or foure branches, which at three inches diffance doe each diem from one center, thoote forth foure, five or fix equall frems about an inch and a halfe long apeece, having a the running all the length of them, and the two innermost strings, being of a darle red colour composing tokismbell : at the toppes of each Remme grow five or fixe long rough hairy finall knaps or bottomes crow-slavishowers of a pinkie rad colour, confifting of five leaves a peece, the onermost whereof shewest like two by helding of it inward, and the inner foure with five chives and a double pointed shew not halte so big as it Whathey are full blowen: in the center of the flower lye fix or feven fuch like final! flowers: the leaves give mile lang broken of little or no talte : after the flowers are past come the feede which are rough burres, sicking

920

to any thing they touched, like the feede of Hounds tongue: within which are contained two browne feeds like unto halled Oates but bigger; the roote is small and long, white and hard, perishing every yeare after seede time. It slowrethin Inne and the seede is ripe in Angust. This may seeme to be the Cancalis rabro flore folio latiore of Lobel, and the Cancalis rubello flore of Clusius fet forth without description, but the leaves of theirs are larger.

6. Cancalis tenuifolia purpurea. Fine leafed Baltard Parfley.

I find in Columna one other very like unto this last also which he calleth Echinophora leptophyllon purpurea, but that the leaves as he faith are most finely cut into fundry parts like unto the wilde Carrots, and the umbells of flowers, and to the feede after them it and by three and three at a place, whose kernell or feede within is fomewhat like unto hulled Barley.

This Parfley hath fundry stakes of hard rough leaves, divided into five party, each leafed into five party, each leafe being three inches long and an inch broad, deepely dented in on the edges somewhat like unto Oaken leaves : the stalke is rough and hoary, two foote long, so crested that it seemeth square, bearing such like umbells as in the last, standing 3. together but their small stems are shorter and thicker, the flowers are red like the former, but greater, having small leaves like beards under them; after which followeth the feede being smaller then the former and not fo rough, containing such like seede within them but fmaller and aromaticall: the roote is white, hard and aromaticall.

8. Cancalia magno fructu echinato. Bastard Parsley with great prickley seede.

The leaves hereof are divided somewhat like unto those of the greater Parsley leased Dauke, set forth before in the

Caucalia Anglica flore rubente. Buglifb Baftard Parlley with red flowers.

6. 7. Cantalic Echinophora major of minor & pupure Colon The greater and leffer Baffard Parfley with prickly feeder.

The Theater of Plants.

Organ of Dances and hairy underneath: the statice is two foote high, and somewhat rough, having the like countries the joints upwards but finaller, bearing small umbelts of white the stowers standing three together and terms the joints upwards but two seedes on them which are ewise as big as others and more rough and prickly, having a pricing mustly within it: the roote is small and white but somewhat sweete both in taste and smell supplies termell within it: the roote is small and white but somewhat sweete both in taste and smell.

Somewhat and hairy underneath: The state of the sta

Parlley hath a smaller and short rough stake, whose leaves are divided somewhat like unto Hemlock The foull variety many a mineral street and proper in many various reaves are divided in mewhat like unto Hemlock by the city of them broader, and the end leafe longest and hairly, all of them dented deepely about the edbrobt sen of them dented acepely about the ed-gr, adotadarke greene colour, at the upper joynts of the stalkes come forth stender branches bearing sparsed and models of reddish flowers, and sometimes more white, and after them small round, rough seede : the

ports fmall and white. 10. Caucalie nodoso echinato semino. Small Baftard Parsley with knotted burres. for from distances, which are a tree for the first of the form of the first of the and documents, and tourne about the course in internal and periffecth every yeare, the feed rifing by the falling of, toky my flarpe prickly and hard: the roote is small and periffecth every yeare, the feed rifing by the falling of, indicated gardens whereinto it is brought.

II. Cancalis folio Faniculi. Fennell leafed Baltard Parfley. This both in stalke and lease very like tinto Fennell, but rising seldome above a cubit high, bearing white seldome in the sel better then of this; the roote is white growing deepe, and of the tafte of

12. Cancalio tenuifolia montana, Small Mountaine Bastard Parsley, The root bereof is formewhat thicke and from it rifeth a stalke of a foote long, divided from the bottome into full road (mooth branches, and they againe into leffer, whose smallest branches even neere the roote as well as bedom, beare small umbells of very small white flowers, and afterwards small long striped seeds: the leaves sertum the roote are divided into very fine and small leaves, but those above on the stalke much more small 13. Cancalis pumila Hiffanica. Dwarfe Baltard Parlley of Spaine.

ThisDwarfe kinde which Beeline brought out of Spaine with a number of other fine feeds rifeth not with us balks foothigh and lower in Spaine, whole leaves are very small and much divided on the stiffe stalkes, bearing missione man and a start them finall rough whitish feeds: the root is small and annualla never swhiberebut once, which was from the first feeds I received from Boel, which was thorough ripe,

Cancalle minor flore rabente Small Baftard Parfley with reddiff flowers. It. Cascalis folio Faniouli. Fennell leafed Baftard Parfley.

The Place and Time.

These forts of Parsley grow in the severall countries of Germany, France, Spaine, Italy, &c. and diversofting in our owne Land likewise; and particularly the fift was found in Lincolnessies, on the North defent of the countries in our owne Land likewife; and particularly the life was round in the life with an night to Bourne; and doe all, fave the last, flower and feede reasonable well, but that work

It is called in Greeke worth?, and Cancalin also in Latine, either of the bemisferical seede, or from the tole It is called in Greeke usurals, and [ancalis also in Latine, either of the vemisperson seede, or from he noise that the seede will make when it is dry, being shaken with the winde, or from narrow mouthed poit, such as seed is like, that make a noise at the powring of the liquor out of them: the first here express is the Cancalis also pribus of Lobel, the Lappa agress of Tragus, the Lappala Canaria Plinis of Anguilars; the Cancalis also valgained Myrrbis Lappa Dalechamps of Lagdanensis, the Cancalis of Dodonaus, Gesner, and others, and the Principal Cancalis also valgained for Columna: the second is the seascalis Hispanica of Classia and Canarrarius; and the third the Cancalis served to the season of the season of the cancalis and canarrarius. Jature rubente pore of C. inp. ; the country not published exactly before, although Gerard Seemeth to have she aculeato semines the fire is of our owne country not published exactly defore a through orrera remet to him split indiff had a hint of it the first is the Echinophora Lept sphillon of Columnas the leventh his Echinophora men identification of the country of the second of the country of the second of the column of the colum minth is figured by Daumins in this removement, out the deletapeton to the wildin our own land the tenth is also the Daucoides minor of Cordus in historia, and of Thalius: the eleventh is the Cancalis of Anguilera, as Labelling. in his Adversaria which Lugdunensis calleth Cancalis Pene, and Banbinus Cancalis folio Pencedani t thetwelith is In 118 Au versaria Willed Languagements and the last I had from Boel by the name of Cancalis marine Init. The Italians usually doe call Cancalis Petrofello falvatice; and the Germanes, as Tragus hath it, Feldt oder Estribute. and we in English Bastard Parsley, rather than wilde Parsley, as the Italians doe. The Vertues.

Dioscorides in regard that Caucalis was a familiar sallet herbe, and therefore used more as meate than medicine siveth no other propertie belonging to it than to provoke urine, but our later Writers have found out and mislished divers others, as Matthiolus, who saith it is comfortable to the heart, and helpeth the obstructions of the liver and ipleene, clenieth the raines and kidneyes, of the flegme and niter, gravell and the flone which incodereth in them, if the juyce thereof be taken: the feede being drunke sharpeneth the eye-sight, and pround womens conries : it is likewife given to men with Miltwaft, and the feede of Agnus caffus against the running of womens confirs it is interwise given to men with antique and the vine, and helpeth the biting of the theraines: it also causeth fruitfulnesse in barren women, being dranke in wine, and helpeth the biting of the Trigon (we understand it to be the Thornebacke) the Drace marines, which is called a Quarier, and these Scorpion being applied to the wound; if the whole herbe be taken with vineger after a vomit, it pages the belief and firreth up a fainting appetite, taking away the evill of loathing ones meate : all the parts of the herbe as well feede as juyce, or decoction being taken, is helpfull to melancholicke persons, and therefore is good to be given against a quartaine ague, and the itch and scabbes, as also for the great French disease.

CHAP. XXV.

Selinum five Apium, Parfley.

Nder this title of Selinum or Apium, is contained divers and fundry forts of herbes, for with the ancients, besides the Ziarroy un meior Apinen borsenfes they had in acordiror Baludapine iperfaces Api pium montanum nitronitation Petropium or Petrofelium, immofiaro Hippofeliummolam appui diam Stueffre and others, of all which I must give you the knowledge, and therefore I thinke it finds

Interior of the series of all which I must give you the knowledge, and therefore I thinks it fined to distribute them into severall Chapters, and to comprehend under each all the species and fort the pertaine to that genus or kinds: and first to beginne with the Apingo become, which by an usuall received into its our Petroselinum, Garden Parsley, whereof I shall say more in its due place.

1. Petroselinum unlgare. Common Garden Parsley.

Common Garden Parsley is well knowne to have many stalkes of stella greene leaves devided into sundry parsons into three parts or leaves, and then each of them into these somewhat round and finely shipt about the edges: the stalke riseth much higher in some places than in others, according to the folle wherein it growth with divers smaller leaves at the joynts, and still siner cut, and long like Fennell at the toppe, that one would not thinke them to be the leaves of Parsley; the flowers are white growing in umbells, and the steep that one would not and sharpe take a the roote is white and long, with somewhat a sugged barke perishing after seeds time, are manufacted as the herbe is also and very pleasant to the taste and somewhat a sugged barke perishing after seeds time, are manufacted as the herbe is also and very pleasant to the taste and somewhat a sugged barke perishing after seeds time, are some sugged barked to the same manner, yet they are since of the same since of the

the like.

3. Petrofelinum majus sive Verginianum. Virginia Parsley.
Virginia Parsley groweth after the very same manner that the Gazden Parsley doth, but larger saving prefit stakes of leaves, set by three and three as in the former, but much larger, even at large as Smallage, into the or yellower greene colour, the stakes, slowers, and seedeure allike but still larger, the seede bing and so thrise as bigge as the common, the roote is greater and shorter, but perishests like it.

4. Petroselinum Cresicum. Candy some Parsley.

This Parsley of Candy is very like to the ordinary parsley, but lesser in every part, having leaves make all of the like divisions, but lesser and somewhat thicker, the stake is like, but shorter than Parsley, being this of white slowers, after which follow stiller seede than that of persisting the professions as we prote in always sage.

of white flowers, after which follow smaller seede then that of Parfley, but blacker : the roote is always for

3. Petrofelham majas fice Virginia

busing one, of the thicknesse of ones thumbe, long, and covered with a thinne blacke barke or rinde that may only be with ones singer, being white underneath, and of a sweetish talte, like unto the Earth Chesnut, big of the cattering of the country of the count orm commenced by the reactives, and avertances which is redded on the outfide, and of this which different in nothing from it, but in the colour of the roote, which is redded on the outfide, and at higher than others, and is called Agricopaftics by the countrey at high former: this flow reth and feedeth earlier than others, and is called Agricopaftics by the countrey netwide as the former: this now fern and recuert cannet than others, and is taken expression by the country that is, fylvebris Passiones, but hath no likenefic to a Passippe, but in that it is it to be eaten. Other than the property of the passion of the passio the face vertices that the ordinary hath.

The Place and Time. The dot all grow in gardens onely in our Ladd; the naturall place of the first being not certainely knowne. in the freed is of the Iland of Sardis, and the third, as the name forwerh, was fent out from Virginia; the last in Con they perfect their feede in August, but the last earlier.

The Names.

The Names.

The Names.

The change is the circumstance of the description of the countries of th

The land of the first the state and broths, Sec. in all countries, as trach beens, a forefaid, being of fo milde a set forefaid, being of formilde a set foreign death helpe to provoke arine and world foreign death helpe to provoke arine and world foreign and didn't a little open the body, but the locality, and to breake winde, both in the flourable and browelly, and didn't a little open the body, but the many more, and opensity the oblimations, both of the lives and spleams, and therefore is usually puramong

those herbes and rootes that move the belly downewards, and is one of the figure according to the body as Dioscorides hashits, and bereby also is profitable for the yellow: Jandilies and Dribe commendeth it against the Falling sicknesse, and to provoke urine mightily especially if the rootes is divided eaten like Parsness: the seed is held by most to be the most effectuall part of the plant, yet this divided roote to be strongest; but the seed is effectuall to provoke urine and womens courses to expellight the strongest; but the seed is held by most to be the most effectuall part of the plant, yet this divided and is also essentially appropriate the strongest of the seed is held by most to be strongest; but the seed is held by most to be strongest; but the seed is held by most to be strongest; but the seed is held by most to be strongest; but the seed is held by most to be strongest; but the seed is held by most to be strongest; but the seed is a seed against the venture, and as pure strongest with a poysson sor that purpose, as also against the danger that comments to them that have taken pointed among other things that serve for the cough: The leaves of Parsey strongest provides all seven in the serve strongest the serve strongest strongest the serve serves strongest strong

CHAP. XXVI.

Petrosclinum Macedonicum. Macedonian Rone Pariley.

Ivers authors have set forth divers forts of herbes for the true stone Parsier of Macedonia, every one supposing that to be the right which they propose to of them all lentend not to entreate in this Chapter there you that kinde, which pare a design eth currant under that name, and joyne thereto another which Landanensis calleth Parsier Design.

1. Petroselinum Macedonicum quibusdam.
The first supposed stone Parsley of Macedonia.

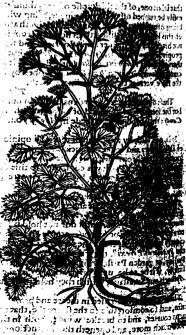

This Parsley of Maccdonia hath divers stalkes of leaves next the ground, divided much like to the garden Parsley, but with greater, broader and rounder leaves, dented round about and in some places more deepely cut in or gashed, of a bright pale greene colour, among which rifeth a short thicke and some what hairy stalke about halfe a yard high or better, full of joynes and leaves, and branches at them that it seemeth a small thicke bush, bearing small umbells of whitish slowers and small rough darke grayish seed after them, somewhat like unto ordinary Parsley s. especially after the roughnesse is them, yet somewhat longer and darker, of an aromaticle and sharpe taste, and of an unsavoury bitternesse last of all like cumin seede-the roote is somewhat thicke short and white perishing after it hat have heard not so in the warmer.

2. Petrofelinum Maccionicum forte Dalechampig.
The fecond supposed stone Passevos Maccionia

This other Paifley taken to be the true Paifley of Macadania.

by Dalechampius and not much gainefaid by Columna; hath a fhort roote (a long roote faith Columna like ordinary Paifley) blocke on the outfide. With a tuft of hair es at the head thereof, neither sharpe nor sweete which is wonderfais (but Columna faith it is both more sharpe and bitter then the common Bussey roote) from whence riseth up sundry stender stalkes, with diverse very thinne cur leaves thereon, all of them like the uppermost sand not the undermost) leaves of Parsley, or like anno Dill of a blew greene colour, having three of the leaves always set together at the end of the winged stalke as Parsley wayes set together at the end of the winged stalke as Parsley thath, and smelling so like unto Parsley as both Lugdanams and Columna doe say, that if any should smell it when it is a clittle bruised that were blinde and did not see it, or having his sight of did not plainely perceive a difference in the leaves, here would farely say it were, very Parsley; at the toppes of the stalkes said after which sollow small seeds like unto that of Parsley; some of the safer which sollow small seeds like unto that of Parsley; some of the

1. Petrofelinum Macedonicum quilifilm. Thefirst supposed stone Parsley of Macidola.

trackift furrowed or gurrered like unto Cumin feede, of a very sharpe taste almost burning the mouth, as sweete sent, but so bitter without date it may well bee accounted the most bitter of all the kindes from.

The list industry originally to come from Candy unto Venice where they have fowen it, and taking it to be the list in the list of it that different countries where they have fowen it, and taking it to be the list in the list of it is the list of

CHAP. XXVII.

Elasselinon, Paludapium five Apium paluftre. Smallage.

CHAP. 27.

Ee have befides the Smallage that hath usually beene knowne with us another for thereof (a) call it from the likenesse) which in my former booke I called Selinam dalce tweet Parley and meane here to joyne it with the ordinary Smallage.

I. Apinm vulgare five Paluftre. Ordinary Smallage. The ordinary imaliage groweth up with greater hollow and more crefted fallies then building greater and larger winged leaves fer one against another, broapium vulgare five palufire. Ordinary (mallage,

der, and of a darker greene colour and thining more then Parfley but dented somewhat unevenly about the edges, at the toppes of the stalkes and branches stand large tufts of small white flower, swhich turne into smaller seede then Parsley: the roote is greater but not fo long and flender, with a number of blackish fibres set thereat: the whole herbe and roote is strong in smell, and much more unpleasant and bitter in taste then Garden Parsley, not to be endured to be eaten alone, but being boyled and otherwise dressed it savoureth better.

2. Selinum five Apium dulce. Sweete Selinum or Smallage.

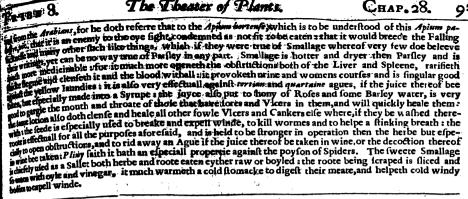

The fweet Smallage or Parsley call it which you please. groweth up in the same manner that the former Smallage doth but larger then it, the leaves likewise are larger but not of so deepe a greene colour the flowers and seede likewise are like those but somewhat larger: the roote is great and long with divers fibres fet thereat, white and much more sappie and pleasant than eyther Smallage or Patsley, with a very warming and comfortable reliath also nothing offeative, but the whole herbe is so pleasant as it Sugar had beene mixed with it: This both rellish and forme wee have found it hath held for the first or second years, the seeds hath beene sowen with us that commeth from beyond fea, but as fweete Fennell doth degenerate more and more in our Land, and onely continueth sweete in warme countries, so doth this, the leaves also decay in their verdure and become nothing so fresh, but are more fullen or fad like Smallage.

The Place and Time. The first groweth naturally in wet and marsh grounds, but if it be planted or fowen in gardens it there prospereth well: the other is familiar in Greece and Italy, where they eate it with great delight both herbe and roote, and is onely fowen and replanted in all those places, the naturall place being not knowne to us: they both abide greene all the winter and feed in August with us.

The Names. The Greeks call the first example Escofelinon which the

Latines render Paludapium or Apium paluftre, and is the fame with the Greeke word; Selinen in Greeke is alwayes rendered Apism in Latine, and thereunto is added the other Epithite, which doth demonstrate is tind at fautheren in the Control of the fayd before in the first division of these Apia: but as I gave you then a caution concerning the Greek and Arebian acceptation of Apiam, folet it here be observed also that Apiam after the Arabian authors, whom the Aparthesian of Apiam, folet it here be observed also that Apiam after the Arabian authors, whom the Aparthesian authors who are a supplied to the Aparthesian authors are a supplied to the Apart the Careles Commander and the Creekes Commander and this Smallage, when a cle April 19 Commander and this Smallage, when a cle April 19 Commander and this Smallage, when a cle April 19 Commander and this Smallage, when a cle April 19 Commander and this Smallage, when a cle April 19 Commander and this Smallage, when a cle April 19 Commander and the Comm the Greekes St finon: and therefore it is by most writers called Apiam and Apiam palastre and Esolelization by Dedonew and Lobel; Columbia in his eleventh book and third Chapter sheweth how by sowing the seed of Apian which the Apian and Apian an (which Mathieles thinketh is this palastre but I thinke rather he meant of the hortense) to make it have a medical leafe and hours and hour leafe and hours winch Matthielm thinketh is this palastre but I thinke rather he meant of the hortense) to make it have a true der leafe and how to make it have a crumpled leafe, and Matthielm saith also that Gardiners in follows he rules have made this Smallage to beare crumpled leaves, onely for pleasure to looke on: but by his tense leeve they are but conceits, and rather fallacies then vertices, for that Apians latifelium is this Apians for many and properties of the pr fed. The other is mentioned by Bellonian in his observations, yet taking it as Columna doth allo but for from taneum altered by art of transplanting, &cc. to make it to be called Geofelinain as Quarrantin deth, who would be the formula to the columna doth allo would be the formula to the columna to the columna doth who would be the columna doth all the columna doth who would be the columna doth all the columna doth who would be the columna doth all the columna doth a (as I shewed you before make our common Parsley to be called Geofelinate as Quarramian dath, who would say I shewed you before make our common Parsley to be Petrofelinam Adacedonicum) make this heric in the Annual bortens, whom Columna doth much inculcate for it: it is generally called Selina and Selina date by all the same and Greekes likewise in their countries. I called it before Selinam dates, sweet Parsley, which is I say in may eyther doe to or call it sweete Smallage which you will, The Arabians call Smallage Assistant and passing and Apis and Apis agrantee, the Spaniards Perexil dagma and Apis, the French de l'ache, and Parslet and Epsick, the Dutch Eppe.

Pliny hath erred much and caused others to follow his tract, in following, and allowing Chryspin and District the Greeken with its writings. The Versues. fin their writings, by militaking the various acceptation of the word spins of the Latines from the Greek

CHAP. XXVIII:

Oreofelinen five Apium montanum. Mountaine Parfley.

Have three forts of mountaine Parlley to shew you in this Chapter as they are taken by the judicious, and thereunto referred,

The first mountaine Parsley hath divers reddish stalkes of large spread leaves, divided into sundry puting the abush on the ground next the roote, very like unto Garden Parsley but somewhat larger smelling wil, from among which riteth up a short stalke of about a cubit height, with divers the like leaves upon it, wil, from among which risers up a more stance or about a cubic neight, with divers the like leader that he had been made to toppe, and bearing thicke tifts of white flowers, after which come small seeded like Smaller to the stance of the st

This other mountaine Pariley shootesth forth a hollow kexie stalke in some places, tall and high in others, short

low according to the foyle wherein it groweth, bea-ing fundry large i pread leaves cut and divided fomewhat lik into the leaves of Hemlocke bearing timbells of white fown, and after them formewhat long blackish seede. likeno Camin feede, being tharpe in talke and tweete in fault the roote is farall long and white.

3. Aplum montausmo Parificufiamo

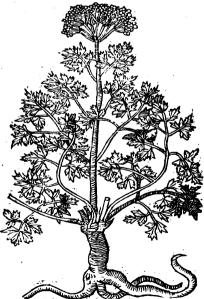

The Parifiam mountaine Parlley.
The Parifiam mountaine Parlley hath a large, thicke, mittoote, talting and imelling much like unto the roote of little terrible, the whole herbe doth refemble Parsley lyig dicke bushing on the ground, the umbells of flowmacwhite and the feede is sharpe in taste, but smelling vay (weete.

The Place and Time. The fift groweth neare tinto Vienna in Auftria as Clufwithand on the mountaines among the rockes in Germay adother places, the next is found in the borders of the fields on the mountaines of Burgundie, the last on the my top of the Surene hill by Park : they florish in the same, and give feede foone after.

The Rames. The Greeke name operations is given to thefe plants, and The circum and Apium montaines in Latine; the condition of the last differ as well in leafe as in the from Discorides description of it, and yet is did brofelimin of many, whereas the fecond onely much nearest to the true Oreofelinum both in leafe and the first is called Oreofelinum by Dodonam (who fish is called by the Silesians Veel gutta: 1, must be said for many things) Label and Clustus, and by Lug-Oroselium majus and Apium montanum Dale-it the second is the Oreselium aliud of Lugdamen-

the fecond Selimum peregrimum of Classus, as Banlike is additional and by ministrict Aplania peregrimum
that is down and by ministrict Aplania peregrimum
that is have as I promise rightly referred it to bee the crue Oreofelinum of Diefeorides, agreeing to well to the last is called also by Lingdoneige Oreofeliania Parificafiam, and by Bimbimis Apina

1. Apium montanum vulgatina. The more common mountaine Parfley.

The Vertues

Dioscorides faith that the mountaine Parlley provoketh arine, if the roote and feede be known a it bringeth downe also womens courses, and is put among those medicines that are made to expell productions that doe warme any cold part. Galon faith it is in working like unto Smallage, but more cateful. those that doe warme any cold part, value built it is in working that the only only things, is hot and free the chicke ground the standard the end of the second degree, that it doth extenuate and make thinner the thicke gross claimly honors. that it cutteth tough flegme, openeth obstructions of the liver and fpleene, and provoketh urine, braitin and openleth the stone, moveth womens courses, and helpeth the yellow jaundise, and being chewed in the most, it draweth much water and spittle into the mouth, and easeth the tooth-ach.

CHAP. XXIX.

Thy felinum five Apium fylveftre. Wilde milkie Parfley.

His kinde of wilde Parsley, hath fundry large spread leaves, somewhat resemblar are den Parfley, but they are divided intomore parts, and each division hath swaller knes.

from among which rifeth up an hollow straked stalke a yard high, reddish toward the bottome, sometimes with the like leaves at the joynts where it bran-cheth forth diversly, bearing large thicke umbells of white flowers, reddish on the one side and pale on the other, and after them stateede, somewhat like unto

Parineppe seede, but a little lesse hot in taste, and somewhat aromaticall, the roote spreadeth divers long strings, blackish without, but white within, and deepe into the ground, fomewhat like unto the Meum Spignell, and abideth many yeares. The whole plant and every part thereof, yeeldeth a milkie juyce, if it be broken in any part.

The Place and Time.

It groweth in moift and marshy grounds, and water-courses, and much also in the moist woods where Alders doe grow it flowreth in Inne and Inly, and seedeth soone after.

The Names. Both Dioscorides & Theophrastus have a reniver dyplor Apinon Syluestre, but they differ much one from another, for Diescorides his is that kinde of Ranunculas, hee calleth Herba Sardinia but Theophraftus doth not number his among his other Selina, and peradventure may be this that hath beene referred both by Dodonaus and Lobel unto the Thyffelinum of Pliny, Which Lebel calleth Thy selinon Pliny, supposing the name Thy selinon, better to agree with the forme of this plant as comming nearest to a Selinon, but howfoever if it be not the same with Pliny his Thy selinum it commeth so neare it, that no other is vet found to neare, especially in the forme of the leafe and property of the roote, as you shall heare by and by; Lobel and Dodonam doe both fay, that this was in former times used in all the shoppes of the Low Conneries in stead of Meum, taking it to be the right; and therefore Dodoneus did also call it Apium street as Lugdoneus doth likewise; Gesner in boris calleth it Dancus palussim, and Cordus in historia Ossenium strom the German word Ofenich, whereby they fo called it; Baubinus calleth it Apinus Sylvefire latter successives; and thereupon I have entituled it in English, Wild milkie Parsley, to distinguish it from other forts of wilde Parsley.

The Vertues. The roote hereof is hot and drie in the third degree, which being chewed in the mouth, drawith downe and flegme from the head to be spit out, and easeth the tooth-ach and this quality, Pliny saith, the roote of his The feliam is endued withall : the other properties appropriate to the other kinds of Apium are no doubt to be found herein, and that to no leffe effect, as both to extenuate, cur, and open, and to provoke urine, and women courfes

CHAP. XXX.

Selinum five Apium peregrinum. Strange Partley.

His firange Parliey hath from along whitish roote, sharpe in talle, well finelling, and saling the fire growing wooddy, and perithing after feede time, divers long stalkes of leaves; lying, or but which are almost round, yet a little pointed and denocabout the edges syettically and nortaling fometimes but three on the stalkes, let by couples and of a fad greene colour, the stalkes, let by couples and of a fad greene colour, the stalkes, let by couples and of a fad greene colour, the stalkes, let by couples and of a fad greene colour, the stalkes, let by couples and of a fad greene colour, the stalkes, let by couples and of a fad greene colour, the stalkes, let by couples and of a fad greene colour, the stalkes, let by couples and of a fad greene colour, the stalkes in the stalkes are stalked to the stalked to the

bless, three of foure foote high with divers leaves, thoosing from it, divided much, and into long parts, and band likewife, at the toppes whereof grow umbells of small white flowers, bowing downe their heads aland double before they rife to be in flower, which better expressed in the former figure, after which come very massure priore they rule to be in mower, which better explened in the former ngure, after which come very half feels not fo bigge as Smallage feede, but quicke and hot and of a good fmell: this by the shedding of its one feede therein.

The Place and Time.

The France and by the paths and wayes fide in the country of the Wheyards, and by the paths and wayes fide in the country of the Wheyards, and by the paths and wayes fide in the country of the Wheyards, and that it flowreth in Improved the feede is ripe in August, but, with us it is more late be-

The Names, and listhe first with him, Bashima calleth it Apinos from principles, and listhe first with him, Bashima calleth it Apinos from what is the third Sacrides with strange sale for the first parties with the front with Pling.

The Persons.

Resulting of hears and drineffe perceived in the take of both towes and roote, but especially of the seedd in the take of both towes and to expell the some of the large it to be no leffe especially or provoken in and to shelp to breake and to expell the some of the large it to be no leffe especially or and the some of the large and before may be also good for other discales, are probable, although we have large also, as Cofsigning given it, she with the same a these things are probable, although we have large also as Cofsigning given it, she with the same a these things are probable, although we have

CHAP. XXX.

Hippofelinon five Smyrnians. Allifanders.

Mer this title of Allifanders, I must comprehend two forts of herbes, each of them called Smirnisms, as that he shows the second of them called Smirnisms, as that he shows the second of the second of them called Smirnisms only of the second of the Solina mentioned by the old Our common garden Allifanders growers the greatest of all the Solina mentioned by the old our common garden Allifanders growers the greatest of all the Solina mentioned by the old our common garden Allifanders growers; care into many parts greater and founder than Small-suction, having divers large spread leaves; our into many parts greater and founder than Small-suction greater and founders and situates, and a little spread into smallers with funding and the same spread into smallers with funding small building from the joynes; each beating large under the same should be a little tracked on the backet, and smill rounds, but a little tracked on the backet, and smill rounds and smilling states and rounders and rounders and rounders should be great, thick it long, and which on the castide of the large trackets and rounds and whilling within.

T by felinum five Apium fibrefin. wilde Milkie Parlley.

2. Supprison Creticum. Gandy, Alifanders.

The Candy Alifanders is the firangest in the growth of any plant, upon the ground, by the algertion of the property plant, upon the lower leaves, for before the stake rifeth, any ane, would rike the leaves to be said that the whole leafe being large, and more divided into smaller parts than the former, as it is were those the whole leafe being large, and more divided into smaller parts than the former, as it is were those the whole leafe being large, and more divided into smaller parts than the former. the whole leafe being large, and more divided into smaller parts than the former, as it is were loss of a darke greene shining colour, and dented about the edges; the stalke is round and stiffe, since smaller, foure foote high or better, usuall having at the joynes whole, and almost round leaves, yet tometimes the round, and here and there cut in on the edges, of a yellowish greene, going which doe noted into the stalke at the bottome of them, as that the stalke in a manner growesh through them a from the logical manner stalke at the bottome of them, as that the stalke in a manner growesh through them a from the logical manner stalke at the bottome of them, as that the stalke in a manner growesh through them a from the logical manner stalke at the stand thicke ruths or unbells of yellowish some, and the stalke running through the toppes, where stand thicke ruths or unbells of yellowish sowers, which afterwards turne my small backlish seeds, about the bignesses of Radish sade: are roote is at the first almost round, as begins we stalk, yet a little long wishall, and white on the guide, which afterwards groweth thicker and logical stalk, yet a little long wishall, and white on the guide, which afterwards groweth thicker and logical stalk, yet a little long wishall, and white on the guide, which afterwards groweth thicker and logical stalk, at the toppe, ending small, but perishing onite after it hash been been been been some stalkers. It is not the stalk in the stalk of the stalk proved the stalk therefore I hold them to be both one, and make no more differing forts.

The Place and Time. The first hath beene found wilde in some of the Hes about our own Land by Mr. William Quicks. thecarie in his time, who gave me and Mr. William Coica famous Gentleman, and a great lover of the feede, supposing it to be differing from the common fort, but after they were growed any was no diversitie. It is usually fowen in all the gardens of Emopo, as faire as I beare, where the there came from Candy. They both flower in Issue or Isly, and the feede is ripe in August. The Names.

in of Mer in Greeke, is called Hyppolelinam allo in Latine, Gaza renderelli it Equations because the greatest of all other their Selina, Disservices saith it was called by some in his time story he saith the true Snys name is an other herbe, which be described in the Chapter following Creticum. There is some controversic among Writers about this Hypoletium and true Hypposelium of Disservices or no, then whether it or the other disservices of conder or no s for the full, Matchielus shewesh the erroit of Research in taking the Palatic

mette l'alime, and faith he findeth not what herbe this Hyphofelinam should be, unlesse it be Levisticum which yet be acknowledgeth not to answer Discovider his notes thereof, because it is in forme so like magnet Selimm, and for this opinion Lobel yerkes him too critically, stewing that Levisticism is too hot and amagnet selimm, and in no place used to be earen as a wort or fallet herbe, and that he did unworthily taxe Brasovolus for best and in no place used to be caren as a wort or faller herbe, and that he did unworthily taxe Brafovolus for the Hallans to be this Hyppoliumin by the faller translation of Marcellus Virgilius, in gid the Hyppoliumin is the blacke without and white whithin, when as Diofeorides maketh no mention and the first in the roote of t to be that he would further search what Disserbles his Hyppellium should be, as not holding this he recome of to be so. Now, concerning the other doubt whether this Hippellium, or the other plant called recome of to be so. Now, concerning the other doubt whether this Hippellium, or the other plant called recome some of the true Smyrnium of Disserbles or no, the currant opinion of mot Writers in the same, and yet as Columna hath in the said place very worthin, at the same control of the district it is nothing so, to Disserbles describeth his Smyrnium, hirst, that it was called landing in the same of the district it is nothing so, to Disserbles or quicke on the tongue, with some pleasant as a lifethat the feed is round like to Colewort seed, (wherein Columna, thinketh some, miltaking of the side that the feed is so that of the plant of the same plant is the black colour black & of a sharpe taste like Myrrhes sweete Chervill, so that one may be used the black colour black & of a sharpe taste like Myrrhes sweete Chervill, so that one may be used to the colour on the inside, of a sweete chervill to the colour on the inside, of a sweete chervill to the cherting the month both roote, seed. & leaves being of an heating properties not any one ther, and that the roote is blacke without and of a which greene colour on the inside, of a sweete stage pendic heating the month, both roote, seed, & leaves being of an heating properties not any one did not be did not be more than the second in this Smyrnium Creticum, and the stage of the green in the second in the Smyrnium Creticum, and the stage of the did right: whether then the Hyposelinum of Dioscorias can be Smyrnium, Dioscoriae himself the stage of Dioscoriaes in the description feet downe a few lines here before unto you: Theophrass which is plainely differing from the lines with the stage with his Smyrnium i for Therphrasself in the stage with his Smyrnium i for Therphrasself in the stage with his Smyrnium i for Therphrasself in the stage with his Smyrnium i for Therphrasself in the stage with his same stage of the stage of Dioscoriaes. (In that the stage with his same is sufficiently declare them) we finde that Smyrnium Creticum is not the true Smyrnium of Dioscorides, as the stage of Dioscorides, which is called also Olm atrum with his is sufficiently knowne, although some authors of Dioscorides, which is called also Olm atrum with his is sufficiently knowne, although some authors on the true Smyrnium of Dioscorides, but not while stage with this the Hipposelinum of Theophrasse with his is sufficiently knowne, although some authors on the stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium of Dioscorides, but not while stage with the Smyrnium wal Columna fet it downe : Columna his Iudgement is, that the feede of this Hippofelinum, or Smyrnium may was cumme tet it downe: Columna in Inagement is, that the teede of this Hippoleimum, of Smyrnism may monthly benfed for Petriglelimum Maccolonicum (if his other fifte leafed herbe that hete mell of Garden lady tenfaled, or pot to be had) than either the common Parlley leade; or that of Venice called Petrofelimum Machine by many, and by him Dancon formation Disferrights. The Italians call the first Maccrone, the Spaniarite limit flating the Petrofelic van Macconicu and the thing the Petrofelic van Alexandrien, and we in English Allifanders:

On Willedman State of the Petropolic van Alexandrien, and we in English Allifanders:

An Allianders are much used ro make broth with the upper part of the roote, which is the tenderelt part, and the chief boiled together and forme sate them either raw with fome vinegar, or stew them, and so eate the chiefely in the time of Lent, to helpe to digest the crudities and viscous humours are gathered in by the michaile of fifth at that time, it doth also warme any other cold fromacke, and by the bitterto open ability from of the liver and spleene, to move womens course, to expell the afterbirth, to the things the feed will doe likewife if either of things the feede will doe likewife if either of the will be the feed will doe likewife if either of the wine of taken in wine, and is effectuall against the bitings of Serpents. Weeknow of no good other hath, being in a manner incipide.

CHAP. XXXL

Seligion Segetale. Corne Parfley.

mid there Apia Parlieyes, let me joyne this unto them, which Iohn Goodier first gave me the knowsign of, with some seeds which springeth in mygarden I thus describe unto you; it is a small low with some nearest which ippingers in mygaroun. It is a cut to you; it is a mind tow the paving fundry winged long leaves, lying on the ground; many being fet one against an arrived medical about the edges, with one at the end, which are each of them longer than Burnet and princed at the ends, among which rise sundry round stakes halfe a yard high with the ends of them bearing forth likewise from the joynes, and all of them bearing small umbelly which time into small blackish seeds effection Parsey but as he and sharpe in take as it: the and white, and perithing every yeare after it hath feeded, and rifeth againe of its owne

The Place and Time.

the fields among the come, or where come hath beene fowne in divers places of the land of its me until August, and the feede ripened a month after at the leaft.

The Mames. re it me by the name of Simuserrefire, and after that I found it an umbelliferous plane, the referred to the Selina or Apia, and called it then Apiam Sifelije from the compositive

1. Cicula valgaris major.

of the leaves like unto Sium odoraum Trage; but lince that I heard it, I fuited it with Selinum Segetale, which is Corne Partley, but it is called in some places of the land Honewort. The Vertues.

Because the seede is both in forme like Parsley, and as bot in talle, there is no doubt but that it is very necre of the fame propertie with Parsley, but because I have not made any triall thereof my felfe, I can fay no more, but what Mr. Goodyor related to mee, that the use of the juyce of a handfull of the leaves to be drunke in a draught of beare every morning for a formight, did cure one that had a swelling in her cheeke yearely there arising sometimes, but whereof it proceeded I could not be showen.

Cienta, Hemlocke,

Here are many forts of Hemlockes to be shewed you fome greater, others lesse, some growing in the marthes, and others by the hedge fides, &c. 1. Cicuta vulgaris major

The common greater Hemlocke. The common great Hemlocke groweth up with a hollow greene stalke foure or five foote high or more, full of red foots fometimes, and at the joynts very large winged leaves for at them which are divided into many other winged leaves, one fe against another, dented about the edges, of a fad greene colour branched toward the toppe, where it is full of umbells of white flowers and afterwards with whitish flat seeds, the roote is long, white, and fometime crooked and hollow within, the whole plant, and every part, hath a strong headdy illiavoured fant, much offen. ding the fenfes.

2. Cienta minor five fatua, Poolish Hemilocke or connigrete Parsley.

This small Hemlocke risch not a yard high, with whiter and imaller states nor specied at all the leave are much smaller comming neare unto Parsley, so that many are inistration in picturing one for another, being one found as a wilde weede in gardens of a paler greene colour. The with few branches, the flowing and seek are both white as the roote is, but small, and perishing every years the fear hereof is much less rootes. five.

This Hemlocke hath much larger winged leaves than the former, thicket fet, more freel, and a faller greene colour (for the smell whereof, which Label calleth a facidiffina! That have had it growing has good for many yeares could never take offence by the smell of it; if it be the larger that Label memory is the larger. great, but rifeth not so high as the common fort doth, and beareth large anticiles of white howers, required wards grow large and thickes hite crooked seeds of no ill some that every bould period to the root and white both growing deepe in the ground, and spreading many great brainches therein, which to grow and white both growing deepe in the ground, and spreading many great brainches therein, which proves eth after it hath given seeds, and yet not alwayes, but at sometimes, and in some places will alie. Last the joyned to this another, which he calleth maxima Branciania, but he himselfe doubters whether it is not the sound to be a some some and the sound to be the sound to be a with this last, and ther fore I thinke good to make no further mention of it.

4. Cicutaria paluliria alba. White wilde Hemlocke.

The white wilde Hemlocke hath a white long thicke roote like Fennell, but divided into many para, being a fweete fent, and an hot sharpe taffe, from whence rife divers stalkes of winged leaves much out in the among which rifeth a stender branched and crumpled stalkes a cubit high, bearing umbells of white with long blacke well imelling feede, after talting sharpe, two alwayes joyned together with a tweene them.

7. Cicataria palastria rabra. Red wilde Hemlocke.
This other red Hemlocke hath a thicke blacke, and jointed roote will divers the forme like the laft, our larger, and not fo much our into pages, and paler of colour, the faller is a foote high, bearing flat umbells, with pale red, or bluth flowers, and long blacks. imeli and sharpe in rafte.

The Marth or Water Hemlocke hath a great thicke hollow stalke, two or three could high and symmetric them. leaves at them, at the joynts with the leaves which are cue into divera parts fomewhat like unto Parligion ler come forth the branches up to the toppe, bearing familiambilit of white flowers, the facilities and blacks, fomewhat greater than Anticedes the roots is long and Mackith, with family familiambility and the come in the company of the company growing from them.

7. Ciemeria bulbe/a. Bulbous rooted wilde Hemlocke.

This bulbous Hemlocke hath divers fielkes of fine our leaves, more lained that the property comming comming tomowhat neare used the Bulbous finding. Buth Chelmic Raves, of a little that pe not the

6. Cicutaria palustrii tennifolia.

a foote and fometimes a cubit high, having thicke and knobbed joynts and leaves at them, at the sopres wi a foote and sometimes a cubit high, naving there are another long seeds like Chervill seeds a shorted franches a number of white flowers, and after them somewhat long seeds like Chervill seeds a shorted from and subcrous, somewhat like unto the roote of the round Aristolochia Birthwort, knobbed or banked for and tuberous, formewhat like unto the route of the value of a Parinep roote, but growing form in forme places, blackiffs browne without and white within of the tafte of a Parinep route, but growing form in some places, blackith browne without and write what longer like a Turnep roote, when it sunneth to seede and perisheth yearely, being rayed of itowar forms The Place and Time.

The first groweth in all countries by walls and hedge sides in waste grounds and untille The first groweth in all countries by walls and hedge sides in water grounds and untilled place, the cond is found as well a road also as in gardens, and the third in Gardens alone in these parts, it is immediate in moist grounds and marshes and by waters sides in France, the fixt by our Thomas sides in many blant and the like Rivers fides in our owne Land, and the last as Clufum faith in Hungaria and Aufria, both wile book and in their gardens, they all flower and feede in Inly or there abouts.

It is called zo une in Greeke med vi zure, a circum vertendo qued vertiginem et imaginem earministe magici untur tanquam circumagantur ac in tenebrat inducat is qua cam biberant, ni fusina declarat Nicaide in luine untur, tanquam circumaganur at in and Cicuta major by all writers, yet Clufiu calleth it Cicuman in the feeth is called Cicuta major by all writers, yet Clufiu calleth it Cicuman in the feeth in the contract to the feeth in the cicuman in i the Cicuta minor of Cordus and Camerarius Cicutaria fatua by Lobel, Apinus cicutarium by Thelini, Inicilian the Cicuta minor of Cordus and Camerarian Curnearia Jama by Loves, Expensional by Tabermontanus, Petrofelini Vitium by Tragus, and Api comes visium by Gefuer in living the dust is called Cicutaria latifolia fatidiffims, and Cicutaria maxima Brancsonis by Espel, for as limit be juigeth tembols one, and Cicutaria Myrrhis by Thalius; by Matshiolus, Gefuer in hore, Langdonous and others Sofie Palmung which Lobel contradicteth, but without just cause as I suppose, as I said before the fourth and situated by Lugdonenfis Cicutaria alba, and Cicutaria rubra, and by Camerarem and Banhinen Cicutaria palufirit for all and flore purpureo, and peradventure may be the Meum Selesianum of Camerarian also as Banbium lath, thefinia flore purpureo, and peradventure may be use secure secure and transmit and Lieusaria patepris by Lebel and dother, and taken to be Phellandrium of Pliny by Dodomess and Lugdonensis, who make it also a kinde of Samon Long, Liousticum (stuestre by Thalim, and Silam Pliny by Casalpinus and others the last was first found or a named Cicutaria Pannonica by Clusius, Camerarius calleth it Bulborastanum Coniophyllum, Tabormentium Myrin Cicutaria, and by Baubinus as I doe also (icutaria bulbofa. The Arabians call it Sucaram, the Italian Cuna the Spaniards Ceguda and Canheja the French Cique and Cocne the Germanes Wurtzerling Scirling and Wattrick. the Dutch Scharbuk dullekernell, and we in English Hemlocke and Kexes.

Hemlocke is exceeding cold in qualitie and very dangerous, especially to be taken inwardly, for the Aller wians adjudged the most wife Socrates to dye by taking the juice thereof, for not thinking rightly of their Gods as Ariffu and Melitur accused him : yet as it was then well knowne some countries bred it stronger to killthen other, and although some doe appoint it to be applyed outwardly to the cods of those that have venerous drames or the like, or to maidens and womens breafts to represse their swellings and repell their milke, yet by reason the places are so tender and full of vitall spirits, it often proveth that the remedy is more dangerous then the disease: it may fafely be applyed to inflammations, tumors and fwelling, in any other part of the body, as alfoSaint Aubbe nies fire, wheales, and puthes and creeping Vicers that rife of hot sharpe humors by cooling and repelling the heate: the leaves bruifed and layd to the brow or forehead is good for their eyes that are red and fwollen, and doth soone ease the paine and take away the swelling and rednesse, as also to take away a pinne and web growing in the eye, this is a tryed medicine, to take a small handfull of the herbe and halfe so much bay Salt beaten together and applyed to the contrary wrift of the hand for 24, houres doth within thrice drefling remove it Ifthe roote of Hemlocks be roafted under the Embers wrapped in double wer papers untill it bee foft and triber and tren applyed to the goure in the hands or fingers will quickly helpe this evill. The remedy for Hemlocks if any shall by mischance care the herbe in stead of Parsley, or the roote in stead of a Parslep, whereby happened a kinde of frensie or perturbation of the senses, as if they were stupified or drunke, is to drinke of the bell and ftrongest pure wine before it strik to the heart, as Pliny adviseth, or Gentian put into wine as others say, but Trages faith that he holpe a woman that had eaten the roote, by giving her a draught of good Vinegar, bat if the given with wine it procureth death without remedy: Manthiolus sheweth that Asses by chance eating of the bride fell into so deepe a sleepe that they seemed dead, which when some came to flay them they flang from them in the doing it, to their amazement and mertiment.

CHAP. XXXIII.

Marrhin. Sweete Chervill or fweete Cicely.

Here are three or four forts of this Myrrhi to be shewed you in this Chapter some wherein later invention then others.

1. Myrrbie major five vulgari. The ordinary Garden sweete Chervill.

This sweete Chervill by reason of the so neare resemblance unto Hemlockes, I though good to joyne next them, which groweth not fo high, but hath large fpread leaves on introduce part, fomewhat refembling the greater Hemlocke but of a frether greene colour, talting as fweete as the American the flake rifeth up a yard high or better, being crefted or hollow having the like leaves at the joyne batter, and at the toppes of the branched dalbes unballed or earlier of making the like leaves at the joyne batter, and at the toppes of the branched stakes umbells or tusts of white slowers, after which one large and log crefted blacke falining feede pointed at both ends tafting quicke, yet fwetre and pleasant like the leater of months in feede: the roote is great and white growing deepe in the ground, and spreading sundry long branches in taste and smell stronger then the leaves or feede and continuing many yeares. Of this kinds were but much greater and larger that was brought from America, especially the leaves, which are store that former not differing else. the former, not differing elfe,

. 2. Myrrhis alteraminor.
The leffer (weete Chervil).

2. Myrrhie altera minor. The leffer sweet Chervill. Ikelia sweete Chervill is somewhat like the former, but the whole winged lease is much lesser, and divided in fewer and lefter leaves also, and softer in handling, the stalkes are lower and the umbells of white flowers sufficient followeth is long but much smaller, and not blacke but tasting searc unto the former the me is abush of many blackish fibres.

Myrrbis (ylvestris. Wilde sweete Chervill. The mile sweete Chervill is likewise a low plant, and not much differing from the last in the forme of leaves multiple formewhat hairy and whiter, the flowers are white, but in more thinne and sparsed umbells, and the the many yeares.

My bifluefire Neapolitana & etiam Anglicana. Wilde sweete Chervill of England as well as Naples. Included Chervill is so like in leafe unto the common Hemlocke, that before it be growne up to stalke it brokensy that gather it, for the stalke is spotted sometimes with white and red, yet seldome so with us as Mollimocke is but whitish, at the joynts whereof with the leaves which are lesser come forth small tufts which were and not at the toppes of the stalkes as in all other unabelliferous plants faith Columna which wee bream observed in ones, after which the seede followeth which are somewhat long and with a long point wertugh and hairy, and cleaving falter to garments then the wilde Carrot feede doth, and is of an aromaticall refrentetafte, mixed with a bitternesse as Columna faith with them but nothing so much with us: the beinfall long and white, not bigger usually then a Parsley roote dying yearel.

be Place and Time. The fathis thought to grow wilde in some fields of Germany, but I doubt the report was onely true for the third in the while groweth wilde with us as well as with them, neare unto dirch fides and other water courses, for half socily kept in Gardens with us and them too as I heare: the second is naturall of Geneva and the parts dundouna Lobel faith, but was fent alfo by Aicholziu from Vienna to Norunberge to Camerarius as hee faith and a likely to be naturall of those parts also: the last Columna found upon some of the hills in Naples, where often feene it growing with us in waste places by way sides, in the fields sometimes and walls sides.

The Names. thoused in Greeke with as well as suppa and Myrrhia and Myrrha likewise in Latine, in imitation of the law in Greeke with as well as suppa and Myrrhia and others Myrrha, yet some have it Smyriam has likewise in the liberastic units Smyrniam, as before the Smyrniam was likewest to Myrrhia some also call it Carefoliam in liberastic units Smyrniam, as before the Smyrniam was likewest to Myrrhia some also call it Carefoliams. and iome Cieutaria from the likenesse of the leaves and of some Camilaus: the sirst is generally called the first is generally called the methods, yet Anguilara calleth it Sefels Peleponense, and is Gasalpinus his Licusaria sertia, and by the methods, yet Anguilara calleth it Sefels Peleponense, and is Gasalpinus his Licusaria sertia, and by the Corressium Hispanicum and by Rankinus Myrrhis major vel Cicutaria edoratas the second Lobel calleting Corressium Hispanicum, and by the faring minor; and is the second Cicutaria of Casalpinus, and by Christian mentana: the third is the Myrrhis of Furblina and others which Camerarium Colonses.

18 8.

936 Sylvestri, and Gesner in hortis Cicataria similis Cicata berba that grew in the fields, and we need to Raubinus calleth Myrrhis sylvestris seminibus hevibus, because hee calleth the last Myrrhis seminibus hevibus, Baubinus calleth Myrbu filverry jeminom meroom, when the way added to the citie Anglicanus beautiful which Columna called Myrbu filv. nova Aquicolorum, and I have added to the citie Anglicanus beautiful. like his. The Italians call it Mirrhida, the French Perfil d'afne, the Germans Wilder berfill, the Durb Kervell and we in English sweete Chervill, great Chervill and sweet Cicely.

Kervell and we in English tweete Chervill great Chervill and I weet Cicery.

The Vertuer.

Galen faith that Myrrhw is hot in the second degree with some tenantie of parts about leaves, the are so since and pleasant in Sallets as no other is comparable to it, and give a better relish to an other put with it; the seedes while they are fresh and greene sliced and put among other het the pleasant; the roote boyled and eaten with oyle and Vinegar, or without oyle if any millite oyle of the sallet or and warme a cold or old stomacke oppressed with segme or winde, or those that have the summarion of the Lungs; the roote drunke with wine is a remedy against the bising of the venezuel langium, as also the Plague or Pethience; the same also provoketh womens out the source of the sallet in sooil to the sallet in the sallet in sooil to the sallet in the sallet in sooil to the sallet in the sallet in sooil to the sallet the sallet in sooil to sall the sallet s it also procureth an appetite to meate and helpeth to expell winde : the suice is good to hade a support of the suice is good to hade a support of the suice is good to hade a support of the suice is good to hade a support of the suice is good to hade a support of the suice is good to have a support of the suice is good to have a support of the suice is good to have a support of the support of head and face : the candid rootes of this Chervill are held as effectuall as Angelica to prefer to the transfer the forming fection in the time of a Plague, as also to warme and comfort a cold weake stomacke.

CHAP. XXXIIIL

Levisticum unigare. Ordinary Lovage.

Aving finished the two former rankes or order of umbelliferous plants, I am come now notice of the third and laft fort which is of such as have broader leaves like Panes or Angellia and be caufe I could not well place the Lovage among the Seline or Apis although it be malthic mothem, and not to be accounted one of them, let me feet it in the coeffront of this broad infed or

der, whose description is thus. It hath many long and great stalkes of large winged lerrer, divided into many parts, somewhat like unto Smallage, but much larger and greater, every late being cut about the edges broades for wards and smallest at the stalke, of a fad greene colour, smooth and shing, from among which rife up fundry strong and tall hollow greene stalkes five or fix foote high, yearight foot high in my Garden, full of joynts and such like but lesser leaves set at them then grow below, and with the leaves come forth toward the toppes long branches, bearing at their toppes large umbells of yellow flowers, and after them flat brownish seede bigget by much then Dill, and lesser then Parsneps and thicker also : the roce growth great and deepe, spreading much and enduring long, of a brownish colour on the outside and which whim the

the plant and every part of the fine lieds Iomewhat strongly and aromatically and of an hot sharpe biting taste. that the difference from the other may be seene, our rootes being great and thicke, and nothing Germanistic that the difference from the other may be seene, our rootes being great and thicke, and nothing Germanistic that the difference from the other may be seene, our rootes being great and thicke, and nothing Germanistic that the difference from the other may be seene, our rootes being great and thicke, and nothing Germanistic that the difference from the other may be seened to the other may be seened design in the flowers which they fay are white, and are yellowish with us, which Dodoneus noteth nicum. house einer they observed it not well when it was in flower, or theirs doth differeth from ours therein. mit is noted in the Passase Heracleuin

The Place and Time.

again no where wide in Europe that I can here of, but is onely planted in Gardens where it will grow as all gent it it be funded but flowreth in the end of Inly, and feedeth in Angust.

The Names. binded untilly in Latine Levisticum (for Greeke name it hath none) and not Ligusticum, being farre diffehad been found from have taken them to be both one, deceived chiefely by the vicinitie of the name, as the following forms, Common and Tabermentanus, who all call it Lignificum, either fativum or vul mans, Comm, County 1 (2015) and County 1 (2015 most to the control of the control o Taken meen translation and the Lorentz and the Lagrange of the Date Lavers and Lavers, and we in labor to the French Leverse, the Germanes Liestockel, the Date Laverse and Lavers, and we in h Ente Lovage. The Vertues.

loree is hot and drie in the beginning of the third degree, and is of thinne parts alfo, and thereby doth open madical humours, and doth mightily provoketh womens courfes and urine, as much as any of the kindes of Inferited roote in powder taken to the weight of halfe a dramme in wine, doth wonderfilly warme a wall lossels, beloing digeltion; and confuming all superfluous mositure and raw humours therein, each all in-walgings and paines, disloverh winde, and resistent poyson and infection effectually: the greene roote here, shuild in after morter, and steeped for twelve houres in faire water, then strained and drunke first in the morning and last at night two or three spoonesfulls at a time, asswageth any drought or great desire to drinke more than a caroufe of cold drinke, found true by often experience, although the roote is well knowne to be hor rivishowne remedy, and of much and continuall experience in divers thires of this Land to drinke the decodion of the herbe for any fort of ague, whether it be quotidian, tertian or quartaine, and to helpe the paines addoment in the body and bowells comming of cold: the feede is effectuall to all the properties aforefaid, exexter laft, and worketh more powerfully: the Germanes and other Nations in times past, used both the rootes salimating and of Pepper to Season their means and brothes, and found them as comfortable and warming to dad walked therewith, and helpeth the plurefie, if it be drunke three or foure times; the faid water also appeliant the eyes taketh away the rednesse or the dimmenesse of the eyes, it likewise taketh away spots or intiging the face the leaves of Lovage bruised and fried with a little hogges larde, and laid hot on any botch or ikwil quikkely breake it : the greene rootes may be kept in pickle made with falt and vinegar for a long time, in peterved with Sugar is more pleafant.

CHAP. XXXV.

Laferpitium. Lafetwort.

🛩 Eçause Lovage was called Laserpitium Germanicum, I thought good a little to declare the true Leferpitium or Lefer of the ancients, both to shew what it was, and what with divers it is now taken to be; and withall to joyne both the French kinde and that which Alpinus hath set out for the true.

Laserpitium Gallicum. French Laserwort. The French Laserwort hath a great long roote, bigger than that of Ferula Fennell giant, of a pinks the colour on the outside, and white within, full of a fat or thicke juyce, and smelling sweete, from where tile up great stalkes as thicke and high as the Ferula, whereon are set divers stalkes of winged leaves like no Smilinge, but thicker, harder, and of a darker greene colour, fomewhat deepely dented about the edges, and ministrate deepely jagged than others: at the toppes of the branches and stalkes sand large umbells of mertikenno Ferula, and after them large flat winged feede like unto Angelica, of the colonr of Boxe, and

3. Laserpitium Alpino. Alpinus his Laserwort. Pehilicofthis Laferwort, faith Alpinas groweth to be of three cubits in height, hollow, and of the bigneffe for Femila stalke, having large winged leaves set thereon, somewhat like the great Selinum, or sweete in the state of th The a milke when it is broken, which is white at the first, but groweth yellow being drie: the proportions this estant upon some of the ancient copines of Inpiter Ammon, as Alpinus saith.

3. Laserpition antiquorum. The true Lasewort of the ancients. The true Latewort of the anticums.

The true Latewort of the in Syria, Armenia C. Media and the interest of the latewort of th and weete talte, which being mot greene, of a ftrong fent and sweete talte, which being mot

1. Laferpitium Gallicum

stened with water quickly becommeth white, if any shall taste the Cyrenian fort it will move and shreal the ha mours in the body to a (weate, with a moift fweet feat, fo that his breath shall finell well that hish talted ber a little: that of Media and Syria is not so forcible or good, and give ha stranger unwholsome sent, All the som of Lafer are adulterated with Sagapen, or with Beane flower before they are dried, the falfehood whereof may be found ont by the taste, by the smell, by sight, ot by the wetting or washing it in water. Somedoe call the fille Silphium, the roote Magydaria, and the leaves Maspetum; the most effectuall is the Later, the next are the laws and the stalkes last. This is Dioscorides his text : but Theophrastus doth more largely expecte in and Pling from him, which is too tedious to infert here: I will therefore but onely mention a few of thosethings that are most pertinent, and not expressed before, which are these : the seede is broad spread like a lease, and called foliam and is as yellow as gold; the stalke is annuall as is that of Ferula; the flesh of the cattle that feede thereon doth rule most favoury, the stalke is eaten by men fundry wayes dressed or boyled it groweth wildeby nature, and will not abide to be manured or transplanted. Pliny faith that in his time it was not to be had but after the weight of five, and that it was so much destroyed, that onely one branch was brought unto the Empercur Ners of all that could be found in his time; and Pliny faith also that it groweth in plenty on mount Parnaffin. Thus faire Thingh after and Pliny, whereby it may be seene what losse there is of it by the great esseeme was made of it, and by the vertues it had which they have expressed, and how hard a thing it is to find out the true plant of all that me knowne now unto us, although divers have referred fundry herbes thereunto as is formerly fet downe, and yet hillis by divers: for fome would make Benzoin the sweete gumme to be the Laser, and called it Asadalcu, which is a word but derived from Laser as it is most likely, and is so farre from reason, that I wonder how men could be drawen fo to thinke, the Benzein being the gumme of a great tree in the East Indies, as all may know that will onquire after it, and is neither hot, sharpe, nor bitter as Laser is said to be : but it is very probable that the Apothe caries, who had many of their names from the Arabian authors, had these likewise of Asadelu, and Asseti da, and peradventure role from Serapio his two forts of Lafer, one pure, and the other impure, but that k faith the pure is of a ftronger fent, and the impure of small sent. The Arabians call the plant Anjuden, the juye Alinh and Avicen Almarut, and the Indians Imga and Imgara. The Place and Time.

This former fore was found about Marfelles in France, as Lobel in Adversaria faith, and adjudged the mell by Rondeleteus of any other that he had seene before, flowring and seeding in the end of the yeare as ferula deth, the other is expressed in the narration before, Alpinm faith it was first scene in Cardinall Bembo his Garden, and alterwards in that of the Musiares. The Names,

It hath not found any other name fince the first invention, than Laferpium and Silphium which was glenited the first by Lobel, onely Banhimm calleth it Gallerm, and Tabermontanu Meffilioricum; the other is declared in the description sufficiently.

There is not extant in any that hath written of the French kinde for what discase it is effectuall, and therefor we can say no more thereof: but of the true Laser Dissortion bath given a very ample recitall, which should thinke it almost needlesse to see downe the vertues of an herbe which is so little likely to be had as this is not instituted.

inni mila cupido, yet to fatisfie those that are curious, these they are: the roote, saith he heateth, and is hardly dided, it hurteth the bladder, and healeth knots and kernells of the throate, called the Kings evill, if it be made and, it furteen the states of the first state of the entrotes, cancer the kings evil, if it be made in acrot or plaifter, and laid to with oyle, taketh away blacke and blew spots that come by brusses or strokes; belgeth the Sciatica if it be made up with Ceratum Irinum or Cyprinum: it taketh away the outgrowings about thindament, it is boiled with vinegar in the rinde of a Pomegranarit resistent the force of deadly possonful. the instance. The Lafer of Media and Syria is weaker than that of Cyrene, & hath a loathfomer fent: it is a juvce than windy and sharpe in talte, and cureth the falling of the haire, if it be annointed with it Wine, Pepper, and Vineis windy and the fight, and disculfeth the pinne and webbe in the beginning, it is put into hollow teeth being gu, it sharpeneth the fight, and disculfeth the pinne and webbe in the beginning, it is put into hollow teeth being gulp in a little limen cloth, with some white Francumsence, and being boiled with Hisope and Figges in Vindent and the state of the mouth in helpest the little limen cloth. noun in water, it it good to wash the mouth; it helpeth the biting of mad dogges, if it be applied to the negrands, afformer enome of any other creature, or envenomed darks or amowes, if it be either drunke or ourwally applied : it cureth the wounds of Scorpions if it be releated in oyle and anointed; it is put into those manyappear ready to runne into a Gangreene if they be first scarified : it breaketh earbuncles or plague fores size that are ready to running the area of the state of t graf Brother superfluous wens or outgrowings in the flesh being first clipped off: it helpeth a continuall hoar segree in the throate, and cleareth the voyce that is fuddenly growen hoar fe, being delaied in water and fupped offin the falling of the pallate of the mouth; being applied with honey, and helpeth the quinfie if it be put mothonical water, and the mouth gargled therewith being taken in meates, it maketh one better coloured : it belieth the cough being taken in a reare egge, and being put into broathes with dried Figges, it is very profitable for those that have the dropsie or the yellow jaundise: it taketh away the shaking fits of agues being taken with requestions have the transcumfence in wine: it is given to those that have strong crampes or crickes in their recket, halfe a struple weight rowled up in waxe and swallowed it draweth out horse-leeches that by chance are exinto the throate and there sticke, if the mouth be gargled with it and a little vinegar, it helpeth those who have hemilie curded in their breafts, and the falling ficknesse being taken with Oxymell, or vinegar and honey : irmoreketh womens courses being taken with Pepper and Myrrhe, and helpeth the chollicke being eaten in a Rifin, and being drunke in lye it fuddenly helpeth crampes or convultions, and burflings: it is diffolved withhire Almonds or with Rue, or with hotbread, to be given in potions: the juyce of the leaves worketh the windput shint less powerfully; this is eaten with Oxymell, to helpe the windepipe when the speech is lost. Pling deduted many of these things out of Dioscorides, but varieth from him in his remedy for teeth-ach, for I cannot think, shith he, that any author would appoint it to be put into hollow teeth to take away the paine, when as we have seen the experience thereof in a man, that for the same cause threw himselfe downe headlong from an high place: for it inflameth oxen if it be put into their nofes: and being mixed with wine, it burfleth those Servents mutaket, who are most greedy of wine, and therefore, saith he, I would perswade men not to be anointed there-with, although they doe appoint it. Galen also lib. de fimpl, briefly speaketh thereof thus; the juyce of Silphium is very bot (faith he) the leaves, stalkes, and rootes, doe sufficient stoutly heate any cold part, but they are all of saulent windinesses hereby it is hard of concoction, but applied outwardly it is of more effect, & the juyce is the from of all other, having a mightie drawing facultie, yet it holdeth a certaine power to take away excrefences inthe fieth, by reason of the temperature is said to be in it, thus farre Galen: Serapio likewise speaketh of the Greeks Laferpitism in this manner : Lafer, faith he is knowne to the Indians to be of two forts, the one fincere hining and cleare, like to Elettrum, of a stronger sent and greater price, which is brought, as it is thought from Generic, Pateric, Mandon, Chiror and Dely, which is a cold countrey, and extending unto Chervam: the other is foole and muddy smelling lesse, which they say is brought from Corasone to Ormus in Persia, and from theme is carried to Pegn Malaca, Tanasiru, and the countries next adjoyning: the Baneans of Cumbaya, who were in timespast Phylosophers, and are now Merchants, and forbeare to eate of any living creature which was the inflitution of Pythagorus doe buy this Laser, according to their abilitie, and put it into their boulds and sallats, mbbing the vessells therewith first, and use no other saws to their meates being pleasant to them, both in taste and smell, yet doth it not breede any loathing in any that are not accustomed to it; the taste the first somewhat bitter as pickled Olives are, but being chewed a while longer it is very pleasant, the which is impure, Porters and others of meane qualitie that live on bread and water only doe buy, because they came for the greatnesse of the price buy that which is sincere, and the Baneans who deale in this kinde of merhandile doe purge and clenfe the impure, and doe not fuffer it to be used in meates before they have cured it by their skill ; and thus much Serapio.

CHAP. XXXVI.

Angelica. Angellica.

Lthough I have spoken of Angelica in my former booke, yet having more to say thereof, and to shew likewise some other forts thereof, I will here insert it with the rest.

1. Angelica sativa. Garden Angellica.

The Garden Angellica hath divers large and faire spread winged leaves, three soute long or better foreign, made of many great and broad ones, set usually one against another on a middle ribbe, of a pale, but The greene colour, and dented about the edges, from among which usually rifeth but one round hollow stalke bing very thicke, and five or fixe foote high, with divers great joynte and leaves fet on them, whose foote fissh, with divers great joynte and leaves fet on them, whose foote fisshes with the bur leffer leives at them, and at their toppes, large round spread umbells of white flowers, but Bransus the his with yellow flowers, which I never faw; after which commeth the feede which is somewhat flat, time, thort, and white, two alwayes fer together, and is usuall in all these umbelliferous plants, and a little

1. Angelica fativa. Garden Angellica.

3. Angelica fylvestriu montand daarum specierum. Two forts of Mountaine Angelica.

1. Archangellen.

TRIBE 8. added the round feeds a the roote groweth great and wooddy when it flowreth, with many great long branadded the round name a time to the growers great and wooddy when it sowreth, with many great long bran-dow it, but perisheth after seede and will rise and, spring against, better from the seede that doth fall of it the what is sowen by hand at any other time: the whole plant both leafe and seede and roote is of an ex-tile the what is sowen by hand at any other time: the whole plant both leafe and seede and roote is of an ex-like the seede and taste very comfortable, being not size of the spe but rather sweete, and give that most other reliably when it is tasted or used; the leaves be the weakest and some hold the seede to bee next, and the distributed the specially being not ready to grow up for taste. Of this binds were hone, and the more reliable when he is capable of the ready to grow up for finalke. Of this kinds were have another fort Dales, and Condens called (west Angellica, not differing in any thing from the former, but in that it hath a fweeter which then the other.

The Theater of Plants.

The wide Angellica groweth up with large spread leaves on the ground having smaller stalkes and lesser divi-The value Angeline growth and water and the state of the growth and the state of the growth of a darke greene colour, not finelling halfe fo strong as the garden kinde, yet savouring so make Angelica that by the small one may some see and know it to be a kinde of Angelica though wilde : the making angular under and smaller, yet growing three or foure foote high with smaller joynts and lesser leaves the toppes grow lesser umbells of white slowers, which turns into smaller seeds and blacker; the must a string to great as the former neyther are the strings so great or long, and of a blacker colour on the office of smaller so well.

Of this kinde likewise there is some varietie, one growing likewise wilde with us, not much differing in the Of the kinds intervite tracted to truth divided, the flalkes being reddiffs and the feede thicker and longer, the Sylvefiting leves, but being finaller and not for much divided, the flalkes being reddiffs and the feede thicker and longer, the Sylvefit is leves. room being great and thicke.

3. Angelica sylvestrie montana. Mountaine wilde Angellica. Mornine Angellica groweth like the former wilde kinde, but much lower and smaller in every part, the mer beref differeth most in that it is nothing so great, but sendeth forth many small brownish strings from the the head round about it, yet holding the fame strong sent of Angellica that the former doth.

Igireyon here the figures of two other forts of Angellica, taken out of Doctor Foxes booke of dryed herbes, while had from Faden garden, and might feeme to be the Laferpitium of Alpinus fet forth before, but that they beliverall denominations to them.

4. Archa golica. The greater water Angellica. This Angellica groweth with a taller and much greater stalke fometimes reddish, the leaves likewise being more in number and smaller divided, and of as deepe a greene colour as the first fort : in the tusts of white slow-en kinke the first garden Angellica, and so is the seede but greater and blacker, the roote is great according to the plant and endure the many yeares without periffiling.

The Place and Time. The full fatte are with us fowen in Gardens, the fecond fort is wilde both in many places of Effex, Kene, and sent Lesis Towne by London alfo, and in other places : the third growith on divers mountaines in Germany, Honor and the reft: the last is not onely naturall to grow in watery ditches, but in moist grounds also in many plant with wand in the Marsh ditches by Rederiffe.

The Names. This beide hath gained many worthy names from fundry worthy persons : for some have called it Santti Spiriundix, Larune, and Dodonom thinke it some kinde of Laserpitium, Co. du, and some others take it to be Smyrm, and Cordus to be Panax Heracleum, but all in general call it Angellica from the Angell-like properties harm, All these forts are so called by most Authors as their titles beare, and therefore I neede not explaine trassenter, onely the last is called Archangelica by Classia, and Angelica aquatica by Gesper. All Christian naturalization their appellations hereof follow the Latine name as neare as their Dialect will permit: onely in Soft they call the wilde kinde Kex, and the Weavers winde their Yarne on the dead staffices.

The Vertues.

hais bot and dry, forme put it in the fecond and others in the third degree. It relifteth poylon by defening the blood and spirits, and giveth heate and comfort to them : it doth the like against the Plague minition of the Peltilence, if the reore be taken in powder to the weight of halfe a dramme at a time, with tome good Topakle in Cardon water, and layd to five ate thereupon in their bed: if Treakle be not at hand take the note alone in Cardus or Angellica water, the stalkes or rootes candid and caten fasting are good helpes also missed installed in the stalkes of rootes candid and caten fasting are good helpes also missed installed in the root also steeped in Vinegrand little of that Vinegar taken fomerities falting, and the roote (melled unto are both good preferences for the pupel, a water diffilled from the rootes fimply of fleeped in wine and distilled in glasses, much more efficient the water distilled are such that the rootes fimply of fleeped in wine and distilled in glasses, much more efficient the water distilled are all with the leaves, and this water being drunke two or three spoonefulls at a time doth ease all water motorments that come of cold or winde, so as the body being bound the said water taken with some of the root is powder helpeth the Plurific being taken in the beginning, as also all other diseases of the Lungs, address, as coughes, and shortnessed for the stalkes mentioned in adbrak, as coughes, and shownesse of breath, Tissickes, and so doth the Syrupe of the stalkes mentioned in whome booker it helpeth like wife the torments of the Chollicke, the stranguly and stopping of the urine, promise one is an expellent the asterbirth and briefely exieth and discussed all inward tumors and winders in opened the obstructions of the Liver and Spieene; and the decoction thereof being deanake before the soft a Age, so that they may sweate if the possible before the sit come, will in twice or thrice taking rid it quite way; in higher halfs digestion in the stormacke, and is a remedy for a Surfer. The faire or the water dropped montered deareth the dignises of signs, any proper in the strangular and helperth deafenesse by appreciant the careet a the pairest also part into bother weet the same; the rootes in powther made up a made the strangular and strangular the careet a the pairest also part into a plainest, and layer on the water decopped or tents were the same and put into old and sixthy deep V core, as powder of the roote in want of the other doct clense them and cause them to heale quickly by covering the same of the other doct in the same of the other doct clense them and cause them to heale quickly by covering the same of the roote in want of the other doct clense them and cause them to heale quickly be covering the same of the sorter and control with the Gostee or Sciarica, doth give a same of the sorter applied to places pained with the Goste or Sciarica, doth give a same of the sorter sorter and such that the core of the Gostee a Sangellica is not so effectuall as the Gardens, although it may safely be cufed to all sections after the such that have been formerly accepted. white then many other that have beene formerly accepted.

TRIBE 8.

The Forties.

Goutewort had not his name given as it (semeth at randome; but upon good experience to helpt the cold griefer; for as Lobel faith his vulgar in taking it to be Electrometry, applyed it for the fame difeases that Danewort, applyed it for the same difeases that Danewort was good for.

CHAPL XXXIX.

Palinaca Latifolia. Parinep.

F Parsneps there are two forts, the tame or Garden kinde, and another that groweth wild in division places beyond the Seas, as well as in our owne Land. 1. Paftinaca latifolia fativa. Garden Parineppe.

This Garden Parinep hath large winged leaves, that is many fet on both fides of a long flatte, each of them for the most part standing directly one against another, and one at the end, being madager. of them for the most part italianing and rougher, and dented about the edges : the falle growth he

or fix foote high, with divers the like leaves and branches thereon but leffer : the flowers are yellow that grow in tufts and umbells at the toppe, which turne into brownish thinne flat seede, smelling reasonable well, the roote groweth greater and larger in some grounds then in others, being white within and without, very fweet and pleasant to be eaten, when they are fodden tender and are dreffed afterwards many wayes as every one lift. Of this kinde I have declared in my former booke another fort differing in nothing but the roote, which is thicker at the head and shorter, and not so savourie as the former.

2. Pastinaca latifolia /glvestris. Wilde Parinep.

The wilde Parinep differeth little from the former, but as a wilde plant, not growing fo faire and large, nor hath fo many leaves and that the roote (as all writers affirme of their comtries) is shorter more wooddy, and not so fit to bee cates, and therefore the more medicinable, but as I faid in my former booke it is the garden kinde is found wilde in many places of our Land fo fweete and to tender after the fowing, that by being manured it proveth as good as the Garden kinde.
The Place and Time.

The first is every where in these parts nursed up in Gardens: the other growing wilde as I fayd in divers places, as in the Marshes by Rockester in the grounds of Sir Ioba Levelon there, and flowreth in Inst, the leads being ripe about the becoming of August the feath period to the feath of the second the feath of the second the feath of the second the seco ginning of August the second years after the sowing, for if they doe slower the first years, the country pleople call them madde Neepes.

The Names The later writers generally call it Pastinaca latifalla to put a difference betweene it and the Carrot which is called Paftinaca tenuifolia, as I taid before, some authors calling it sativa or domefica or vulgaris. Fuchim calleth it Silvium fatioum mag-num and Tabermontanus Elapobofcum fatioums join Columna taketh it to be the Sifer of Diofervides. The wilde fort is cal-led by many Paftinaca fylvefirm or latifulia frivefirm as Dodo-ness doth, Cordus upon Dioferrides calleth it Paftinaca fylvefire Gallica, Matthielus Dodonem and Tabermon Elaphonecum Entitud in Cital Silvium and I shall Burdes Patinaca (slouderin Arabum an Elaphonecum Entitles in Cital Silvium and I shall Burdes Patinaca (slouderin Arabum an Elaphonecum Entitles in Cital Silvium and I shall Burdes Patinaca (slouderin Arabum an Elaphonecum Entitles in Cital Silvium and I shall Burdes Patinaca (slouderin Arabum an Elaphonecum Entitles in Cital Silvium and I shall Burdes Patinaca (slouderin Arabum an Elaphonecum Entitles III)

nam doth, Cordus upon Dioscorides calleth it Passinaca sysvestive Gallica, Masthiolus Dodonem and Thermann Elaphoboscum, Fuchsium calleth it Sisse sysvestime and Lobel Bancia Passinaca sylvestim Arabima an Elaphoscum of Dioscorides, I shall referre you to the next Chapter, into Apothereries shops of Italy and Germanistic was usually called Bancia, Trague saith and so doth Dodonem, the some in their time did call it Staphylium as well as the other tennisolia. The Italians call it Can otta bianche, the spain and Canaoria Blanqua, the French Passinades, the Germans moven weif, Passinay and Passination the Duch Passinates. Pastinaken.

The Garden Parsnep nourished much, and the nourishment is good and wholsome, but a little windy, where The Garden Parsnep nourisheth much, and the nourishment is good and wholsome, but a little windy, which by it is thought to procure bodily lust, but it fattered the body much if it be used: it little respects by proceed uses most of those between and rootes doe that are much eaten, which made Disservites and Gales not to be self-the much upon them; onely it is conducible to the stomacke reines and bladder and provoketh unit; but the wilds kinde is more physicall, having a cutting, attendating, clenthag and opening qualitie therein; it resistes make the bitings of Serpents: it easeth the paines and stitched in the sides, and diffolveth winds, both in the short macke and bowels which is the chollicke and grovoketh Wines, this roote in often used bastle foot more.

Pafinaca latifolia fative. Garden Parineva.

1. Sifer vulgare.
The common Skirret.

CHAP: XL: Sifer. Skirret.

Baretwo forts of herbes to thew you under this title of Sifer, whereof the one hath beene fetcht as farre as from Syria.

The common Skirret hath fundry stalkes of winged leaves, somewhat like unto those of thereps, but that they are smaller and farther set in funder, smother and greener, and likewise is integer, but that they are smaller and farther set in sunder, smother and greener, and likewise found from the edger, among which riseth up the stalke, little more than halfe the height of the Parsneppe, lessing the toppes umbells of white flowers, which after wards turne into small darks seeds, somewhat bigger has less toppes umbells of white flowers, which after wards turne into small darks seeds, somewhat bigger has less to be composed of divers small long round white rootes, set together at one head, like the labeling busched out, or uneven in sandry places, and rugged, or as it were wrinckled with all, and not seed to the same seed out, and white with a single share to be cause.

1. Sign alternass Syriacism. Skirrets of Syriac, of white Cartots.

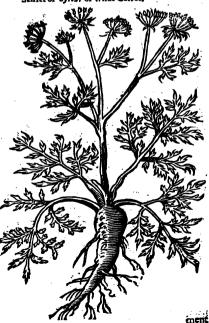

The Spine Skirret hath a long, tender and smooth roote, grayish on the out side, and white within, and easie to the stalk and integer, and twice the length, having sundry small bunches or known as the season like we have a sheet and smooth roote, grayish on the out side, and white within, and easie to the white which a ones single and twice the length, having sundry small bunches or known as the season like we

The lyes a knice maint a long, tender and innovations, grayin on the our nee, and write winnin, and eafle to broken thicke as ones finger, and twife the length, having fundry small bunches or knottes thereon, like unpowers, of a pleasant sweete taste like unto our Carrots, from whonce rise many stalkes of leaves, much diviwww. ... of fundry parts like unto Carrot leaves : the stalkes likewise have such like leaves at the joynts and midle of flowers at the toppes like unto them for forme, but of a yello wish colour.

The Place and Time. The fifth not naturallin any places of Italy or Germany that I can understand, but in the countrey of Nar-line irrace, as Lobel laith, and is every where sowen or planted in Gardens, and with us rather sowne than handler sowne among Onions, the one will not hinder the growth of the other, the Onions being still drawne any have the full growth against Winter the other groweth wilde in Egypt by Cairo, but min their gardens, as Ranwelfius faith : they flower and feede later than the Parineppe. The Names.

lis alled in Greeke Zioneer, and in Latine also Sisterum and Sister: the first is called Sister by Matthiolus, Cordus, Gijur, and Comerarius, and Sisterum by Tragus, Dodonesus, Lobel and others. Casalpinus calleth it. Sister Germanicus, and the Comerarius, and Sisterum by Tragus, Dodonesus, Lobel and others but affuredly herein they are both decired, for Dieferrides describeth Elaphobes cam at large, and how soever the manner of the leaves deceived them, that they were like unto the leaves of the Turpentine tree, yet neither is the stalke of this Ferulous, that is from and great as that of the Parfirep, is, nor hath any umbells of yellow flowers, nor feede like Dill, both which the Parlicy, for this Skirrer hath white flowers and feede like Parlicy, for that I wonder how fuch wife. and judicious men, that in other things will scanne the text of Diefeorides throughly before they give their judge-

2. Sifer alterum Syrlacum. Skirret of Syria, or Wilde Carrot.

ment, and yet in this have failed much, as you may understand by this that hath beene said i now where a manured or wilde Parsneppe should be Disserties his Elaphoboscom, I incline to thinke rather the which the tame, although he saith, it is sweete and fit to be eaten; for as I said before, even the wilde might be with them, as we have shewed it to grow wilde with us. Another controversie there is among many have men, whether this be the true Sisarms of Disserties or no, in regard that neither he not any other of the said have given almost any touch of forme or lease or roote it had, because it was so familiar and well have their time, and so it salleth out in many other things that were so common with them, that they drought said less to describe them, that they are now most unknowner to the succeeding times, and to they em our time greatest propability that we have, is that, as Disserties saith, Sisarms is pleasant to the pallate, profession their rootes are) all which agree to the Skirrer is but Pliny in setting forth his Sisarms in the said as the said of the said of the said his Sisarms said to the setting that the plants his Sisarms said to the said of the said his Sisarms said to the said of the said of the another said to the said of the another said the said is the said therefore there is no doubt but that it is the true Sisarms of sit of the ancients: the other Rannolsius said his called in Egypt by the Arabians there Secaral's Storage of the Spaniards Chiribas: the Chirobas: the French Cherny, the Germans Gerlin: the Duck Snycker norteen, that is Sugar toor, and we in English Skirret.

Skirret rootes (for no other part is in use as I know) being dressed according to every ones liking doe nound well, but not so much as the Parsneppe, it being of a stronger taste, and this more delicate and pleasant, and is so very wholesome, yet engendreth a little winde, and provoketh to venery: it doth somewhat respective kidnies and bladder by moving to utine, and a little to consume the stone and gravell in them: and this is all that we have learned it to be availeable: for those herbes and roots that are temperate and most used to be extended kise physically applied for any disease; the other as Ranwelsian saith, is died to be exten also by the Egyptian, nother rootes are and is common with them.

CHAP. XLI

Saxifraga Pimpinella. Burnet Saxifrage.

E have foure or five forts of this burnet Saxifrage, to shew you here, some being of our ownecountry, and some of others, and some greater or lesser than others.

1. Pimpinella Saxifraga bircina major. Great Germane Burnet Saxifrage.

This great Burnet Saxifrage of Germany hath divers large and long stalkes of winged leaves, one set directly opposite to another on both sides, each being somewhat broad, alittle pointed and dented about the edges somewhat deepely, of a fresh greene colour almost shining, from among which rise upone or more round hollow stalkes, three foote high or more, set at the joynts, with the like, but lesser leaves, and bering at the toppes small umbells of small white slowers, after which come small blackish round seed like und Parsley seede, but much hotter in taste, and sharper upon the tongue, the roote is small long and white, very like unto a Parsley roote, but much hotter in taste, and perisheth not after seede time, but endureth long.

2. Pimpinella Saxifraga major flore rubbente. Great Burnet Saxifrage of Germany with a reddifi flower. This fort different little from the former, either in forme or greatnesse of leaves or talinesse the stalkes, the chiefest difference consistent in the flowers which are reddish or of a blush colour.

3. Pimpinella Saxifragamajor nostras. The greater English Burnet Saxifrage.

The greater fort of our English Burnet Saxifrage groweth up in the same manner that the former doe, the former of whose leaves is all one likewise, but that they are usually not more than halfe so biggeor large, and not so deepely dented about the edges, but of a sadder greene colour; the stakes likewise are smaller and shoute than the other, the umbells of slowers are white also and the seede small and blackish, but sharper than the former; the roote is long and whirish enduring long.

mer: the roote is long and whitish enduring long.

4. Pimpinella Saxifraga bircina minor. The smaller Burnet Saxifrage of Germany.

This lesser Burnet Saxifrage of Germany hath likewise sundry shorter stalkes of finer cut leaves by much than he former, every one set against other, being very narrow and much cut in or deepely dented about the edge, which maketh the lease see in it were made of many fine cut and jagged leaves see on both sides of a stoot sake, which sometimes groweth reddish, and is very neere of the same fresh greene colour that is in the suit the stalkes rise as high, almost, and the umbells of slowers white like the former; the seede also is blackish but smaller, but more bot, quicke and sharpe as the seede hereof is also.

5. Pimpinella Saxifraga minor nostras. The lesset English Burnet Saxifrage.

Our lesset English Burnet Saxifrage hath much finer cus leaves than the last, so that there is not halfe that broads to be seene in them that there is in the leaves of the former, but yet divided after the same manner, and of so darke a greene colour as the greater English sort: the umbells of flowers are white, and the seede that followed smaller than of the last, the roote likewise is smaller, but as hot and quicke in taste as it.

The Place and Time.

The Germane kindes grow as well in their fields, as on the mountaines, and in rockie grounds, and as it is affire rmed unto me by divers in our owne land likewife; the other of our owne land, are finally growing in most medowes of this land to be easily found of them that know them, and will looke for them, for they like ind among the graffe oftentimes fearfely to be different : they doe all flower about Iiily, and their feeds in the sound of Angust.

The Names.

The ancient Writers neither Greekes nor Latines had any knowledge of any of these plants, but are called of

themoderne Herbarilis Pimpinella fimply by many, as Cordin, Tragin, Fuchfim, Cefner, and Lobel & Pimpinella Saxifushy Matthielm and Camerarius, or Saxifraga bireina, as Gefner & Clusten do, fome also Bipinella Saxifraga, as Lad, or Eipenula as Lacuna, or Tragofeliums major as Tabermontanus; the fecond is remembred by Gefner in hord tori, or opennia as Lacuna, or I ragojetimum majus as I amerimontamie the tecond is remembred by Gefar in bordi, it is inferiptione most in fracti; the third is the fecond Pimpinella of Tragus, yet is greater than that kinde that gowth most ownel and; and so is the fift, and is most likely to be Baubings his Pimpinella. Saxifraga remifolia; though it the third Pimpinella of Tragus, and is called Pimpinella minor by divers, and Saxifraga hircina minor by densitive by Cordus to be Daucus Selinoides, and by Lugdunensis Dauci sertim genus, and by folimina to be Ingium Disferrids. There is growing at the rootes of these Saxifrages in some countries certaine graines that millione factors. will give a seatlet die, as Lacuna and Anguilara have set it downe, and by them called Cotton radicum, but Amasus Library faith that the like graines are found at the rootes of many other herbes. Fragofus feemeth in reciting belignines growing at the rootes of these Saxifrages, to thinke that these graines are the Cochenill that the Dirnse to die their silke and cloth in graine colours; for he sixth, lib. 3.e. 15. that the Cochenill that comment how how be the graines that grow at the rootes of certaine plants like unto our common Burnet Sa. ifrage. where he was much miltaken, for as Oviedus faith, they are gathered from the leaves of great trees in the West hale, and died there Tunal, and with us Ficus Indica, and as it is fet downe in the eight part of the West Indian Hi-My the fourth Booke and thirteenth Chapter (and in the Classia of the trees in this Worke) from whence it fruith lebin de Last of Anwerpe in his fift Booke and third Chapter, pag. 229, of the West Indian History tooke his relation thereof, which is somewhat too large to insert in this place. I will therefore but briefely touch what he there faith, that there are divers forts of Fices Indica, fome that beare no fruit growing wilde, or fo thorny that which to no use : others that are manured and beare fruit, which are eaten, and are either white, which are the but of a reddiff purple colour dying their hands that gather them, like as Mulberies doe i and there is anodetuning of forthat beareth no fruit, but is of greatest worth, and most catefully kept, because that certaine the abtracted thereon (which are that graine called by the Spaniards Cochenil, derived from the Coccas of the the and this as a diminative thereof) which they gather twife or thrice in a yeare, and kill them by casting old water on them, and after wards drie them in the shadow batt of this he saith there are foure forts, some betworfethan others, the worfer being gathered from the wilde plants, the belt from those are planted in order hem ordand, and tended carefully. Trague calleth this Saxifrage Figure Germanicum, and faith that no other cale more fitly referred to the Petrolinum Macedonicum of Diofeorides than it, who compared the scede more fitly referred to the Petrolinum Macedonicum of Diofeorides than it, who compared the scede and many the seede of Amoes, yet to be sweeter in smell like unto spice, and there and hove in taste, and to win tockie places, and hereon complaineth that then more willingly spend their coft on strange things fetcht forming, than upon their owne hombred and country plants, and afforedly the feeds hereof is so aromaticall, happing in withall that I thinke he had reason to to thinke as he did, when as it farre surpassers in the surpassers in anot to be doubted of, or none to goe beyond it a but I am in doubt I thall finde among my brethren the that will taxe me for inferring this noveltie: if it please not them, let the judicious centure it as That inde cause and reason. Tragm also saith that some others referred this to the Oversalimentor To:

Friss 8.

The Fornace.

These forces of Sanifragues are hotter than any the former kindes of Apia Parlies, and as hot as Pener, at as Tragm faith, more wholesome, by his often experience: it hath the same properties that the Parlies as Tragm faith, more wholesome, by his often experience: it hath the same properties that the Parlies are the parlies of the Mother, and to propert their couries, to breake and avoyde the some in the Kidnes, in district viscous and tough flee me in the Richies, and is a most speciall remedy against all kinde of viscous being boyled in the diffilled waters begretely it singular good to be given to those that are troubled with being boyled in the diffilled waters begretely find guide into Comfits, as they doe Caraway seede, which is and Convultions: some doe use to be supposed after sayd, and forme doe distill the water that the more tender stomackes may take the little sweetened with Sugar: the jury of the herbe being dropped into the most grievous wounds of the last doth dry up their moysture and limited restriction quickely: the experiment is taken from Hermes whose combined doth dry up their moyture and limited restriction quickely: the experiment is taken from Hermes whose combined distilled water to take away freeking or other spots in the skinne or face, and to make it the more deterned finiouth.

ACHAP. XLIL

Pinax. Alheale.

Internd to intrease in that Chapter, and with it some others that for their likenesse may be reserved the form of this Chapter, and with it some others that for their likenesse may be reserved the form of this Chaster, and with it some others that for their likenesse may be reserved the form of this Chaster, and with it some others that for their likenesse may be reserved of this Chaster, and form may be reserved of this Chaster, and form may be reserved of this Chaster of the fifth Chaster of the worke, but Theophrasse maketh some forts, for unto these three headeds fourth, which he callett Syriacum but doth not describe it. I have to shew you in this Chapter many other som, that for their likenesse price of the price of the price of the strength of the s

among other rare feeds by fome of my divers friends from Italy, but perished by some extreme hard winter.

2. Panax Heracleum alterum five peregrinum Dodonci. The more ordinary Alhease of Hercules with us.

This Panax spreadeth many very large winged leaves round about upon the ground, most of them two foot long, consisting of source, sive or six couples of rough winged leaves, set each against other on a round great footestalk, surrounded on the upper side, each of them consisting likewise of three or source coupled rough but large faire fresh yellowish green's leaves & one at the end, broad below, and narrow to the end, the ordinary of size and facely desired by the derivative of the second size of the lease being always decreases the becomes then the other and facely desired by the derivative for the second size. lower fides of the leafe, being alwayes deeper at the bottome then the other and finely dented about the edge, taking a little hot and bitting in the mouth, and yeelding forth a yellowish juice in the Sommer much more gummy, hor and bitter than the leaves; from among these leaves riseth up one strong great round green slak four or five foote high or more, with some joynts and leaves thereat, and a few branches towards the toppes where breake forth small yellow umbells of flowers, which afterwards give whitish yellow flat short seede : the roote groweth somewhat great and deepe downe into the ground, with two or three long branches from it which yellow on the outfide and more white within, full of that yellow sap issuing from it if it bee cut or broken, of a link strong sent and hot bitter taste more then eyther lease or seeds: this description is from the plant growing in mine owne Garden where it abideth the extreamest winter without harme.

3. Panax Heracleum Alterum Americum plendente folio, Laserpitium creditum quibusdam.

American Alheale of Hercules with shining leaves, supposed to be the true Laserwort.

This Herculean Alheale groweth for the forme very like unto the last, having such like winged leaves set in the fame manner, and the wings with foure or five or fix couple of leaves, but differing in greatnesse and color, for neither is the whole stalke above halfe so long, nor are the leaves themselves either halfe so great so broader to long, but are rather somewhat short, and of a deepe greene colour, very much shining on the upper side and pair greene underneath, much hotter and sharper in taste then the former and not bitter drawing water into the mouth: the stalk hereof is seldome above a yard high, with joynts and leaves thereon, and more branches through the coppes then the other bearing larger umbells of yellow flowers succeeded by flattish but almost roandlede, of a pale browner colours the roandlede. of a pale browne colour the roote is white and great at the head with fundry long strings thereat with a pith in the middle and endureth not after seede time which sometimes is the second yeare after the springing and lone-

rare times the third. There is another fort hereof with taller and purplift falkes, and larger browne green leave.

4. Panax Coffinant five Pfendsfirm Matthieli. Coffus-like Alheale.

This Coffus-like Alheale different not much in forme from the fecond but in the greatnesse and substance of the yellow juice which this giveth not and therefore is not of that kind, for this hath such like large winged laver, the fermion of t fer in the fame manner but leffer together, each leafe whereof is larger then a Parinep leafe, thicker, rought and more crumpled also and dented about the edges: the stalke is small and about two cubits high, full of joyns and leffer leaves for a share them. leffer leaves fet at them, branched towards the coppes and bearing round tufts of yellow flowers, after which follow flat and somewhat round seeds a the roots is sapple with a thicke fielhy barke, and of a shiming ass countries. bitter and sharpe in talte.

CHAP.42.

5. Panaci Heracleo similis Tataria Ungaris dilla. The Hungarian Albeale of Heracles.

This Hungarian or rather Tartarian herbe hath the leaves much cut in and gashed on the edges somewhat This Hungarian or rather Tartarian nerve main the leaves made and a surface of the contents, full of a rough harings, a pale greene colour, with other smaller ones less divided and less ones less among whom then rough ones less divided and less ones thurs and such as the content of the cont pale greene colour, with other image of the thicknesse of ones thumbe, full of joynes and such leaves for the thorough the leaves for the thicknesse of the thicknesse of the thicknesses of the thicknesse grow be ow, but smaller and more divided compassing the stalks at the bottome; at the toppe of the state of the stalks on the toppe of the stalks on the stalks on the stalks of yellow showers, after which follow the seede very sparingly set on the ambile (in some doth not perfit the seede many more sailing then holding) which is very great and thicke, refer the stalks. flower doth not perfit the seeds many more faiting that start the content of the Cachrys, and firaked like thereunto: the roote is very great and long even as thicke as one same, and a cubits length which perifheth after feede time, and doth finell very fouly that one can well man to a cubits length which perisheth after seene time, and done it be growen to feede is taken and attachen by feedl, but rather cast them out of the garden, yet this before it be growen to feede is taken and attachen by the feed of the garden o Hungars and Tartares in stead of bread, and is pleasant to them being of great use with the Tartar, to with out it they could not marke their long journeys through the Defarts where no foode is to be found.

6. Panaz zaeminor feu racemofa Americana. The cluster berry Allheale of America.

This herbe of America rifeth up with a round pithy brownish purple stalke, set at the joynts with large leaves divided into many parts, usually by three at a space, little dented about the edges bearing both at the joynts with the leaves and at the top on fundry branches, many tufes of flowers made of small threds like Vine blostomes, at the first greenish, but whiter afterwards, which turne into small bunches of greene berries, which grow to be darke red, when they are ripe, full of a pleasant tasted juyce, with thany seedes therein: the roote is of the thicknesse of ones thumbe, and very long: it loofeth both stalke and leaves every yeare, and new fpring up againe after winter: The whole plant both leaves and rootes are eaten as fallets and potherbes, of the Indians where it is naturall, and the French also that live amongst them, and taste more pleasantly then the berries themselves.

7. Panaces moschatum Americanum. Sweete fented Allheale of America.

The first leaves of this Panax are large and about a foote long, onely dented about the edges, somewhat like unto Costmary leaves, lying on the ground, and compassing the long white roote at the head, but those that follow are so deepely cut in that they reach to the middle ribbe almost, the stalke rifeth tobe two cubits high, without any leaves thereon fave onely about the middle, where that ha knot and a leafe that compasseth it of a differing forme from the rest, the toppe branches are so heavily laden with umbels of white flowers, that before they open they hang downe their heads, which have so excellent a sweete smell, that they smell like Muske, a great way of the place where it groweth : the seedethat succeede are like, but not so broad as the ordinary Panax. The leaves tafte sharpe, and a little bitter, but the roote leffe:

The Place and Time.

The first groweth in Nalpes as Matthiolus saith, on the Apperine hills also and the Sea coasts by Siena: the second is thought to grow in some places of Italy also but generally in our gardens the third came first from America, & the feede being imparted to fundry persons is received fundry names, and came to me out of Italy for Laferpinian astiquorum, and is fet downe in Cornutus for Angelica lucida Canadenfis, and the other fort thereof for Angelica un purpurea Canadenfis : the fourth as Matthiolus faith groweth on mount Garganus in Apulia : the fift in Total and Hungaria, the two last in America, and doe all flower and seede in the end of Summer.

The Names, It is called in Greek mirans i mirat and Panax or Panaces also in Latin, because it is a remedy for all dileate, not as Pliny taketh it from Fiercules, to be the fifth founder of it, and some would have it named rather from Heraclea a City in Candy, but the name Panax is referred to many plants, as Theophraftus faith, there are many one Panaces, and Diofeorides faith Origanum fylvestre, called also Canila bubula, and Canila galinacea, which is like to Origanum Heraclearity was called also in the Canala bubula, and Canila galinacea, which is like to Origanum Heraclearity was called also in the Canala bubula, and Canala galinacea, which is like to Origanum Heraclearity was called also in the Canala galinacea, which is like to Origanum Heraclearity was called also in the Canala galinacea, which is like to Origanum Heraclearity was called also in the Canala galinacea, which is like to the called also in the called Origanum Heracleoticum was called also Panax Heracleum Centaurium magunm also, and Liguftium were called Panax Heracleum. The first here see downe is the Panax or Panaces Heracleum of Matthiolm, Anguilles, Gold in hortis, Lobel, Lugdunenfis, and others, but Dodoness taketh that Panax Heracleum that grew in the low Com-is a differing plant from it, and may be the true Panax Heracleum or Herenical of Dioferides, the fecond is the Panax nax Atterum recentiorum Olufatri ant Paftinace folio of Lobel, the Panaces pergrinum of Dodonem, but milikus by Lugdunenfi, who calleth it Panace Chironium Dodonei, when as Dodonam taketh the Panace Chironium Dodonei, when as Dodonam taketh the Panace Chironium of the Helianthes or Helianthese of the Control of the Cont Helianthes or Helianthemum of Pliny as it is, and to by (luftus, Cordin ond others, Banbinus thinketh it may be

The Syriacum of Theophrafius, whereof there is great probability, for the feede of this plant as Lobel faith among the gam Openaux, and fower by Condenbergion a famous Apothecary in Antwerpe which no and mong the gam opposed, and how by Connenerges a ramous Apothecary in Antwerpe which no the plant that brought forth that gum Opposes, out of which it was taken, which as you fee the sum of the plant that of Diofeorides and Theophrafts. The third was fent to use y the name that of Diofeorides and Theophrafts. The third was fent to usely the name that we would be the property of the confidence of the plants, which was a canadents, but not rightly for the finell of the root with we is more life to the confidence of the plants, Library or man, our maying went commuted it, a round it remembred by Cornatin among his Canada plants, it is made a lacida Canadanfis, but not rightly, for the finell of the root with me, is more like unto Turpentine in lagilies, the other fort hereof he calleth are purpares. I cannot referre it better to any plant, then to the large it carryeth so like a face thereunto, and therefore call it. Pands: Heracleum alterna Americanum, co-c. Mean Marticolor first set forth by the name of Pfendocoftus, and so, many others have called it since, and School Matteriorm in the total by the matter of Franceoffer, and 10, many others have called it fince, and Office form but Comeration in borte faith, that some called it in his time Panax Chrisonium, and Tabermentanus chair Panax Costinuum, and Costinui Lyricus, but Casalpinus Herba Costa, and Banhimus Panax Costinuim, whom the fifth Clustus setteth forth by the name of Tataria Ungarica, and Banhimus thinketh it may be the Balliant to Costa, the Casalpach in his timketh it may be the Balliant to Costa. Hills me min less that the fact in Tartaria, whereof he speaketh in his journey into Persia, that the when the decockion of the leaves make their drinke, and the Hungarians their bread of the roote, and Tommer the pon calleth it Panaci Heracleo similis Vngarica, The last are so named by Cornstin, as they are set beneinheir titles. The Arabians call it Stensie Ieusie, and Giausie. The Italians Panace Herasles and thereaf-beneinheir titles. The Arabians call it Stensie Ieusie, and Giausie. The Italians Panace Herasles and thereaf-traight Christian nations that know it, and we in English Allheade of Hercules, according to the Greeke sigminarion of the word.

The Vertues . from the tootes and stalkes of this Panax Heraeleum, being cut faith Galen, commeth forth that juyce or gum and opposes, which is of much more use then any other part of the plant, and is hot in the third degree, and om virious de la company de la dwithhole medicines that procure womens courses, the juyce or gum faith Melnes hath a speciali property the intermediate that produce womens contrast, the juyce of goin active parts, as the braine, nerves, lensitive parts, incident to any of those parts, as to juy and therefore profitably applyed to all the cold greefs incident to any of those parts, as to juy average fight, an old cough, shortnesse of breath, pursinesse and wheeling and is good allo for the Sciatica, begoin the knees and feets, it is good likewise for crampes, convulsions, paines, and stitches in the sides, by the widiosis, welling and hardnesse of the Spicene, for the strangury also and difficultie in making urine: it like-wide distill the windinesse hardnesse and suffocations of the mother, provoketh their courses and expelleth the build a Plague fores, and is profitabley applyed with mollifying falves, and those that cure wounds and form the head, it helpeth the toothach, being put into an hollow tooth, and helpeth the biting of a mide Dogge, and against all other poisons of venemous creatures. The leaves of the Hungarian Tataria byselin water is a familiar & usuall drink with the Tartars as the roots are bread to the Hungarians as is before more water is a raminar of mutal uring with the 1 stray as the roots are bread to the Immariant as is before in the persist of the American plants are found to be more alimentall then medicinall, being familiarly eaten when we are not to be more alimentall then medicinally being familiarly eaten when the same is faith he hot & dry in the third degree compleat, it openeth, clenfeth, cutteth & maketh thin, and legitable, that he hot & dry in the third degree compleat, it openeth, clenfeth, cutteth & maketh thin, and legitable, that he hot & dry in the third degree of the things that are related of it, that is, it helpeth and greeks of the head and nerves, and is also helpfull for the cough, thortnesses of the head and nerves, and is also helpfull for the cough, thortnesses of the and the like, as also the best of the cough of t fourth winde Collicke and against the obstructions of the Liver and Spicene, the Stone and gravel in the rise and bladder, and the diffeates of the mother, to bring downe the courses, and to expell the dead birth; it likewikbelethall old greefes of the head, the fiwimming and turning of the braine, the falling ficknesse, the Letharge, Covultions, Crampes, Gouts and the like: it killethallo the wormes, and provoketh urine, and helpethall

CHAP. XLIII,

Libanotis latifolia. Herbe Francumsence with broad leaves.

Fthatkind of Libanotis that hath Fennell-like leaves with all the forts thereof, I have spoken before in the fourth Chapter of this Classis, there remaineth such to bee entreated of that beare broad leaves which shall follow in this as I there promised.

1. Libanoria Theophrassi major. The greater white herbe Francumsence.

This greater Libanets hath many great long stalkes with wings of large broad leaves some eight inches long special amost four broad, five being feet together whereof one at the end, one against another, three or four broad below and finaller to the end, being somewhat hard in handling of an overworne greenish colour blick dented about the edges, among which rifeth up a strong round stalk, four or five foot high oftentimes, with the leaves on the joynts but fewer and lesser then grow below and a few branches rising from the up. was used like leaves on the joynts but fewer and leffer then grow below and a rew branches ruing from the upper joynt bearing large (pread umbells of whitifh flowers, and after them formewhat flat and round light feede
the long together, white on that fide where it is joyned, and firaked with rough crumpled firakes on
the content of round fide, and of a pale browns colour when it is ripe but a little purplish before: the roote growthe great and long, whitish on the outside with a ruft of hairt at the toppe, abiding long, smelling and tasting
the great and long, whitish on the outside with a ruft of hairt at the toppe, abiding long, smelling and tasting
the great flowers as many other umbelliferous rootes doe, but the feede thuch stronger,

The lefter white herby from the forme of leaves, flowers, feede and rootes, but that

Minister Liberties agreeth with the former both in the former of leaves, flowers, feede and rootes, but that agreetles, and the number of leaves are more fet together on every stalke, being also more deepely dented the interest of the roote is white but more bitter then it.

The is mother fort hereof which Bankinus callett Libertie larifolia minor femine crifts, and different onely in the larifolia minor femine crifts.

wer leaves on the stalkes, although as small and but one or two deepe cuts on the edges.

3. Libanotia Theophrasti Apy folio Cretica. The truest herbe Francumsence of Theophrastus.

This plant which I take to be the truest Libanotis of Theophrastus Apy folio, that is yet extant, bath a stalke about a cubit high, divided into fome branches, with leaves both below and above fet (paringly, fomewhat refembling Smallage for the largenesse of the leaves, and dented about the edges, bearing white flowers, and large, rough, croo--ked brownish seed:the roote is covered with a blackish barke, and very white under-neath, smelling strong like Francumsence. 4. Libanota latifolia Aquilegia folio. Columbine leased her be Francumsence.

This herbe Francumsence hath a thicke rugged browne stringie roote, with a white

pith in the middle, finelling fomewhat iweete and bitter in tafte, having a tuft of blackish haires at the toppes, from whence rife fundry leaves upon long foote stalkes. broad & hollow at the bottome like a skinnie huske, cópassing one another as those do also onthe upper stalkes, and are hard in handling, yet of a shining darke greene colour above, and whitish underneath, with divers purplish veines running through them, not all of them divided like unto Columbine leaves. but many of them parted into five leaves, with three divisions apeece, others into three leaves, each standing on a stalke: it hath one white round stalke, straked with purple, rifing up more than three cubits high, with divers joynts thereon, and branched towards the toppes, bearing every one a large um-bell of small white flowers, and after them

long and broad striped scede, of a purplish colour somewhat bitter, hot, and drawing water into the mouth if it be a little chewed therein, and somewhat sweete in smell.

The Place and Time The two first forts are found in many places in Germany, and the parts necre adjoyning, the third in family, and the last it is likely came out of Æthiopia, by the name was given it. The two first seede with us yearely, after they are well growne; but the two last very seldome, unlesse the yeare prove hot and kindely.

The Names. It is called At Barins in Greeke, from the fent of Francumsence which it hath, and Libanois in Latine, and some Cervina alba, and Cervicaria alba, but generally Libanotic latifolia, that it may be knowne to differ from the former, which is called Ferula folio, it is translated Rosmarinus by divers, when as properly the Rosmarinus of the Latines, is but the first kinde of Diescorides his Libarotin, called Stephanomatice, that is, Libanotin Cormoin, because it onely was put into garlands, and so Galen did account it: the two first here set downe, are accounted and to the later Writers to be the Libanois fersilis of Theophrassus, which is set downe in his 9. Books and 12. Chapter, with leaves of Smallage, but much greater; the fruit or feede whereof was called Canchy, with a great white thickeroote smelling like Thus or Olibanum: but how any can well make the leaves hereof to refer Smallage I cannot fee, or that the feed hereof was ever called Cachys, having a canflick qualitie, or thereof the fmell of Olibanum. I onely touch this as a Quero further to [be confidered of : and it is probable that the figure that Marthiolius giveth for his Ligniticum alternm, was enrended for this Libancia, the five leaves being million in the placing, for that they should not be set so close together, or else he entended it for the Aquibite fits, lot he calleth this Libenotis, Sefeti Libinoicum in another place, as Gesner in hortis, Lundanentis, Clima and there doe, calling it Seseli Athiopicum Manhioli, and therefore to helpe the matter Dedonam calleth it Islinoicum horba: it is also Tragus his first Seseli, and the Danci alternam genum of Fuchsing, Turner, and Ispansia, the third Comments of th nensis: the third Camerarism saith that it was sent on un of Italy by the hame of Siler Creitons, and it the Rosmarisms Selini folia, that Honorius Bellus maketh mantion of in his full Epistle to Clustus, & saith is fully called Siler Creticum by many, but is by him taken to be the true Libanotis Theophrafti, to whole judgement after thus farre, that it is the truest and the likeliest of any other we know extant; the last is called by Control to borto Sefeli Athiopicum alterum, and faith the feede was in finell and rafte formewhat like Cinamon Tanimal calleth it; as I doe, Libanotis latifolia Aquilegia folio. Bankinini in this Pinax maketh another lefter fort of Libanotis which he calleth Apij folio, and referreth the Diancus angulofo callet of Circles in his history thereuno, and like wife the Libanotis albaminor of Thalins, whereas both it and that of Cordus, as also that Libanotis Things in nor of Lobel are all comprised under his Latifolia altera five virigative, and are not severall plants, as I think.

T be Vertues. This herbe Francumience is of a mollifying and digetting qualitie, helping the old griefes of the trail and lungs, the falling ficknesse, and the jaundise, if it be taken with Pepper in wine it increases herebe.

1. L'abanoi le Théophraift major. The great white herbe Francamience:

The Theater of Plants.

bull if the roote be taken in wine, it likewise easeth the paines of the stomacke and belly, and the biting of veteds, if the roote be taken in wine, it likewise easeth the paines of the stomacke and belly, and the bitting of vesting bests and Serpences, produceth womens courses and the urine being stopped: the leaves being bruised and pained that the bleeding of the piles or hemorrhoidalt veines, the heate also and swelling of the fundamental distributed to be easily cured: which does hard tumours and impostumes to ripenesse, which does hardly yeeld to be easily cured: which does mixed with honey and put into soule ulcers clenseth them throughly: the peth likewise those was tunters, or that have convultions and crampes, and the gout, being bruised and applied with the meale of hardland some vinegar; and being used with vinegar; it taketh away the morphew or discolouring of the skin, but allot the rheume of the present of the leaves and rootes cleareth the eye-sight, and sharpneth it, and also the rheume significant them, applying it to the forehead; the seede also of any of these forts doe the like, but if it be that seede, which called Gasbry; that is forbidden to be taken inwardly, by reason of the causticke and burning qualitic with its discolouring on tham the mouth and throate being taken or drunke. herin to inflame the mouth and throate being taken or drunke.

CHAP. XLIIII.

Sphondy lium. Cow Parsneppe.

Libough formerly there was but one fort of the Cow-Parineppes knowne and divulged to the world, verthere are now divers others found out, some in our ewne land, and some in others, all which

The othery Cow Parsney groweth with three or four large spread winged rough leaves, lying often may begound or else raised a little from it, with long round hairy foote stalkes under them, parted usually may be growed a little from it, with long round hairy foote stalkes under them, parted usually may be ground or else raised a little from it, with long round one arches and one montrainifions, the two couples standing each against other, and one at the end, and each division or leafe being infromd, yet out in somewhat deepely on the edges, in some leaves and places, and not so deepe in others, and a whitis greene colour, smelling somewhat strongly; among which rifeth up a round crested hairy stalke two or the foote high, with a few joynts and leaves thereon, and branched at the toppe, where stand somewhat largements of white slowers, but sometimes a little reddish,

anaformen flat whitish thinne winged feedes, two alwayes joud together, as is usuall in most of these umbelliserous plants: the roote is long and white, with two or three long fringer growing downe, into the ground, fmelling likewife frough indunplealant.

Sphendylium majus sive Acanthus Germanica major.

The great Cow Parineppe of Germany. This greater fort differeth onely from the former, in the largemichohofleaves and Italkes, being neere twife as large, I memeevery single leafe or divition, which are seldome above thron agreet long foote stalke, above halfe a foote long, unto takete, which is hairy and rough, of the like evill greene co-lor, and a little foulded in or crumpled, and dented besides on theology, the flowers and feede are alike, but larger, as I faid, ground higher, of an hot unplea fant talte; but not so unplea fant adjecther: the roote is white, and like the other but greater.

3. Sphondylium majus aliud Laciniatis folys.

lagged Cow Parineppe of our owne Land. This jagged Cow Parineppe groweth as high or rather higher that telat, and with greater stalkes, and a white hairinesse on them the lower leaves grow very large and much spread, diviad inofive parts or winged leaves, two couple standing diredy cach against another, but of another forme, for each of these the or divisions are parted into distinct parts, yet closely joysed athe bottome, the two fides leaves or divisions being not dhalle that length that the middlemost is, which is in some awe fire treches long, in others above five, and not above halfe where inches long, in others above five, and not above halte anchored, each of them having a deeper cut or notch at the anchored, each of them having a deeper cut or notch at the ance, than is on the reft of the leafe, which yet, is dented a series of the series of them have the series of the se

the time, and fpringing a new every yeare.

phondylium Alpinum parvum. Small mountaine Crow Parsneppe. his small fort bath a falke a foote high, parted into two or three branches, and pale greene great leaves on the state of the state of

2. 3. Sphendyliam majm & alind Laciniatis foliis. The greater Cow Parineppe of Germany: and another with jagged leaves.

and others pointed, hairy likewise, and dented about the edges, the flowers on the umbells are white, and the feede thinne and broad.

5. Sphondylium Alpinnm glabrum, Smooth mountaine Cow Parsneppe. The roote hereof is white and great, the stalke joynted, and two foote high, the leaves are like uno Figgi-leaves and smooth, being a hand breadth long and two broad, besides the foote stalkes which are a little rough, assume that the stalkes which are a little rough, assume that the stalkes which are a little rough, assume that the stalkes which are a little rough, assume that the stalkes which are a little rough, assume that the stalkes which are a little rough, as stalked into three parts, but not to the middle and dented about the edges: the toppes of the branchs. have umbells of smaller white flowers standing on them than in the other : the seede is flat and round, but having a small pricke or point at the end.

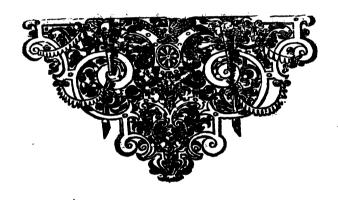

The Place and Time. The first groweth in moist medowes, and the borders or corners of fieldes, and neere dirches generally through the land : the second is proper onely to Germany, as I thinke: the third was found by Mr. George Bonles a worthy and industrious Gentleman in Stropsbire, as I take it : the fourth on the Alpes of Anstracthe last on the Alpes of Baffil: they doe all flower in Inly and feede in August.

The Names.

It is called in Greeke σουθύλιον and σουθθύλιον Sphondylium and Spondylion, for both are extant in good authours, derived as it is thought from Spondyle, a flie stinking like this: Matthiolus, Gesner, Lobel, Dodner, and other control of the state of the doe call it Sphondylimm; but Tragus, Cordus, and some others call it Branca writing, and Fuchium Acanibus value ris five Germanica, and fo is most usually the second fort called by divers; and this is the plant, as I thinke, that De ris sive Germanica, and so is most usually the second fort called by divers; and this is the plane, as I thinke, that Dadonaus in his Chapter of Panax, did rather take to be Spondyllam alterum, because it bore white slowers, and is I said, is very likely, for that which Lobel saith, he saw with yellow flowers was a Panax, and not this the third is it is a plant lately found out to grow in our owne land, so I have given it a name, correspondent, as I thinke to the forme, yet I thinke verily it is the same that Banhinus hath described in his Prodomusi by the name of Spondylins bir same said in the same shall be said to the same shall be said to the same said in t Medow Parineppe by fome.

The feede of Cow Parsneppe, as Galen saith, is of a sharpe and cutting qualitie, and therefore is a medicine fit to

RIBE 8. prostothole that have the cough and shortnesse of breath, or the falling sicknesse, or the jaundise; the roote detailed, and available to all the purposes aforesaid, and besides, is of great use to take away the detailed of the purposes aforesaid upon it; the seed likewise beautiful beautiful beautiful. destite quarte, and available of the first purpose and related, and benues, is or great use to take away the destine that groweth on a Fiscula, if it be scraped upon it: the seede likewise hereof being drunke dother than the series seems to be a seem t adouskin that growermon a rittina, it it be icraped upon it: the feede likewife hereof being drunke doth the being drunke doth the being drunke, as the fmoke thereof when it is burned received underneath, and the mother, as well being drunke, as the fmoke thereof when it is burned received underneath, and of the mother, as well being drunke, as the imoke thereof when it is burned received underneath, and specified fuch as are fallen into a deepe fleepe, or have the fethargie by burning it under their nose, and if it is introduced be boiled in oyle, and the head rubbed therewith, it belpeth not not onely those that are fallen into a but those that have the lethargie or drowfie evill, and those that for long sime are troubled with the head-but those that have the lethargie or drowfie evill, and those that of hingles: if the juyce of the wife the but those distributions of the same and are full of matter. THISTLES AND THORNIE PLANTS.

CLASSIS NONA, THE XIXHT TRIBE,

CHAP. I.

Cardus & Spinola Planta. Thisles and Thorny Plants.

giovopjus major & minor, Laranns Erwiceppaum stor I omenio m, and store Corona fratrum, Cinara diversarum specierum alimentosa, & Corduus benedittus.

I. Carduu pratensis latisoliu. Broad leated field Thistle. The broad leafed field or medow Thillle fendeth forth fundry large and long leaves cut in on the edges, and outpart finely dented, and fet with small prickes that are very tender, of a whitish greene colour: those that sow phigher upon the stalkes are smaller, two of them fet together at a joynt where they so compasse is, but they will containe water in them, even as the Teafell doth, at the toppes upon long stalkes grow single grampickly heads, out of which start pale coloured thrummes, compassing a few purple threads in the midde adalter they are faded and gone, small whitish seede somewhat bigger than those of Cyanus. Corne flower, a Blew-bottle wrapped in downe, as all the forts of Thiftles are: the roote is somewhat long and great, abiding

2. Cardum pr. tenfis Acanthi foliys laciniatia. The yellow jagged medow Thiftle. This medow This the hath very large leaves, almost a foote long and fomewhat broad, cut in on both sides into further deepe gashes, even to the middle ribbe, set with prickes at the dents of the edges, from whence ribbe deepe gashes, even to the middle ribbe, set with prickes at the dents of the edges, from whence in the edges of the edges. thin pallraked flalke about two foote high, fet with a few lesser, at the tops whereof stand divers small sumpallraked shall along two foote high, fet with a few lesser, at the tops whereof stand divers small sume pickly heads, and out of the middle yellow threds or thrummes, which after wards give seede inclosed in the roote is great, long, crooked, and speading in the ground.

3. Cardum bulbosu Monspeliensum. The French bulbed Thistle.

The whitish leaves of this Thistle are of an hand breadth long. somewhat fat and thicke cut in on the edges, ine whitish leaves of this Thistle are of an hand breadth long, somewhat fat and thicke cut in on the edges, but not very deepe, armed at every dent with small sharpe prickes: the stalke is two cubits high hairy and slength with start of the prickly heads upon long soote stalkes, to with start of no leaves thereon, at the toppe whereof stand harmelesse prickly heads upon long soote stalkes, and out of them pale purplish thrumanes, wherein afterwards lie the seed inclosed in much downe: the roote stamposed of divers tuberous small long clogs like unto those of the Asphodill sastened together at the head.

4. Carduss Pratens Asphodeliradicibus. Medow Thistle with Asphodill rootes.

The Thistle hash divers blackish cloggie rootes like unto the Asphodill or Piony, which whither and perish start prate start of the sta

953

cut into many parts, armed with sharpe prickles on all sides, every prickle ending in three points, from where rifeth up a tall stalle, somewhat branched with one or two prickly heads at the toppes of every one bland, or of which come purplish flowers, and afterwards small long seede wrapped in downe. Carduns pratenfis polycephalos. The many headed medow Thiftle,

This Thiftle hath but few leaves lying next the ground, being both short and narrow, armed with superior long prickes, the stalke is round straked and without prickes, spread into stundy small branches bearing men. long prickes, the stalke is round straked and without prickes, appearance to the middle of them finall heads with purplish flowers, made of thrummes or threads thrusting out of the middle of them, but he finall heads with purplish stalked is inclosed in downe as the rest are the roote is lone, head in the final heads. fmall heads with purputh nowers, made of the unimities of the many beginning or them, but the with large and fiverpe prickes: the feede is inclosed in downe as the rest are; the roote is long hard and woods,

with large and fiverpe prickes: the feede is inclosed in downe as the relt are: the roote is long, hard and woods, of Carduns palustris. The moist Medowes Thistle.

The roote of this Thistle is single, the stalke three cubits high, straight and full of prickes, thicke see withdate greene leaves unevenly waved, and sometimes more deepely cut in on the edges, having a sew prickes at this and branched toward the toppe, with many small heads upon slender stalkes, and reddish purple slowen likes.

thers, and then turne into downe.

7. Carduns Ceanothos five viarum & vinearum repens. The Creeping way or Vineyard Thifle.

The rootes of this Thifle are very small and whitish, running both deepe and farre about under ground like unto quiche grasse, but have no knotted joyns therein like it, but shooteth up heades of leaves from the bunches of the roote, so that it will be as ill, or worse than Quiche to weede out, is it be once got into a ground; the content of the roote of the roote. of the roote, fo that it will be as in, or worle than Quiche to weede out, in a counce got into a ground: the leaves are of a pale greene colour, fomewhat like unto the rough or prickly Sowthiftle, a little curin, and as it were crumpled on the edges, armed with very swall, and sharpe hard prickles, the stalke growth to be a yad were crumpled on the eages, armed with very twan, and may be have principled the maine growen to be a yard high, straked and prickly, with some such like leaves thereon as the lower be, but smaller to the toppe where it is high, straked and prickly, with folia fuel fine leaves the course made of thrummes in the middle passing into 8. Carduus Avenarius sive Muscatus. The Oaten land or Muske Thislie.

This Thiftle that rileth fometimes to the height of a man among the corne, is found growing lower in other This This that riteth tometimes to the neight or a man among the corne, is found growing lower in other places, having divers very sharpe prickly jagged leaves fet round about the stalkes, and at the toppes what they places, having divers very man pe prickly jugged leaves let follow be the flowers confifting of thread or are branched many small short heads fet close together, out of which come the flowers consisting of thread or thummes, as in other Thiftles, some whereof will be white, some of a deeper, and others of a paler pupile cothe times, as in other 1 milles, tolke whereof will be white, followed a deeper, and other or a pair purple to-lour tending to a bluth in many places finelling fweete like Maske, which being faded, the feede followeth wrip-

This small Thisse hath rising from a su all long roote divers long leaves, somewhat like unto the Auralilian This small Thittle hath ruing from a 10 an long roote diversiong leaves, ionnewn at like unto the Attrallylis of Distaffe. This lee, but smaller, and armed with sharpe prickless the weake leaning stakes are divided usually into two other, betweene which groweth on a foote stake a small This lee-like head armed with a dozenvery small long prickes standing up round about it, being so finely netted that it maketh admirable the Workensser, the middlemoft head, ever growing lower than the rest round about it: when these heads open, the blew flower appeareth never spreading much, after which come small white seede inclosed in a little downe, which will slea-way with the winde, the heads are sweete and edible before they flower. The Place.

All these forts of Thistles grow in fields and medowes in Vineyards and grounds sowne with corne, as well in our owne Land, as beyond the fea, fome of themalfo on Heathes, Greenes, and wast grounds in many place, as the Ceanothos on Kentish Towne greene abundantly.

1. Carduus pratenfis latifolias.

Cardeus butbofm Monspellenfum. The French bulbed Thiftle.

TRIBE 9.

Cardane Comothos five viarum er vinearum repens. The creeping way or Vineyard Thiftle.

The Time, They doe all flower in July and August, and their scede is ripe quickly after? The Names.

A'cir Acanus in Greeke in my judgement is most properly Cardons in Latine, for from theme beal the Co A canus in Greeke in my judgement is most property on an annual state from mence be all the Called Acanacea; the prickly heads whereof being called a called Acanacea; the prickly heads whereof being called a called a canacea; with Acanacea and Called Acanacea with Acanacea and Called and Called a called a called a canacea with Acanacea and Called a cal Called Acanacea; the prickly heads whereof being called wave common, the Landber call common and Theophraftu in his first booke and fixteenth Chapter mentioneth Acanac with Acanacad Trym is not kinde of Thistle. Some would thinke that or have in Theophraftus should better agree to denomine the kinde of Thistle. Some would thinke that or have in Theophraftus should better agree to denomine the kinde of Thistle. kinde of Thistle. Some would thinke that or makes in I neoporagine mound better agree to denominate the nall kinds of Thistles, written as well with Ypsilon as lota, because Gaza doth alwayes transact is simply dues and generally all the Latines, to which opinion Lagdanens is seemeth also to encline in the Chapter of dues and generally all the Latines, to which opinion Lagdanens is seemed and Lobel by Lagdanens same: The first here set forthis the Cardana praceuse of Trague, of Gesser in borth and Lobel by Lagdaness same specific, and is thought to be the Leimonia of Theophrash, sib 6.6.3. which he putteth among the Thisle will be supposed the wood to call it Beta sivestimic the same filtestria, and is thought to be the Lemons of a coupring man, motors, which are puttern among the Thillipprickly leaves, but Gaza hath very evilly translated the word to call it Beta florifiers the fecond Applications of Milling it is the fecond Application. prickly leaves, but Gaza hath very every translated the word to call it be a first the second Against Lugdunens doe fet forth under the name Existibales taking it to be that of Play in his as. Books and 13. Coter, which Baubinum calleth Cardum pratens: Acanthi folys laciniasis: the third Lobel Saith the learned of Acanthi folys laciniasis: the chiral Lobel Saith the learned of Acanthi folys laciniasis: the chiral Lobel Saith the learned of Acanthi folys laciniasis: the chiral Lobel Saith the learned of Acanthi folys laciniasis: ten, which Baubinus calleth Cardnus pratengs Acanthi folys laciniasis: the third Lobel faith the leaned of Active Cardnus bulbofus. The thereupon called it Cardnus bulbofus Monspelien from but Cluftus clicking guinto congener, and Anguilara Leusescantha, Baubinus calleth it Cardnius praintiffs, praticipate the fourth is called by Lugdanensis Acanthus filvestris after Dalechampy, by Tabermontonia I acanthus for the fourth is called by Baubinus Cardnus praintiffs and found profunde & tenuiter laciniatis: the fift is called by Baubinus Cardnus policepholos the fixt likewife is see from Baubinus by the name of Cardnus passific is the seventh is taken to be the Canadhas of Thospiris is a forth both by Anguilara Lugdanensis and Columna, by Baubinus Cardnus vinearmus repens solic Sands Baubinus Cardnus fivestris in avena and Thalius Cardnus e Avenarius Tabermontonus Cardnus and Grac Cardnus miscellus; and by Baubinus Cardnus in avena proveniens, which Lugdanensis mikething Drypi Laice and Woodle the Scolumnus. and would have to be Scolymus.

The Vertues.

All these Thistles are temperate in heate and drinesse, and are good to provoke uring, and to amend he had ing smell thereof, as also the ranke smell of the arme holes or of the whole body to be boyled in white added the same also is said to helpe a stinking breath, and to strengthen the stomacke, Play such that the pair being bathed on that place which wanteth haire or is fallen of, will cause it to grow againe speedily.

CHAP. II.

Cardum molis Cirfinm distus. The loft Melancholy Thiftle.

F this Thiftle there is much varietie, some growing in medowes, some on mountaines, some with broad leaves others with narrow, some greater others smaller as you shall finde them here ex

Cir fium maximum mentanum. The greatest mountaine Cir fium or Melancholy Thille. This great mountaine Cirjann bath divers large whigh greene leaves lying on the ground, fond what broad and long, pointed at the ends, as also dented about the edges or as it were a little jagged, fet about with small short prickles: among the which the stalkes that rise up being great hoary and straked or ordinate three or four foote high, bearing standary such like leaves but less up almost unto the coppe, where uponloss the standard and bearing standary such like leaves but less up almost unto the coppe, where uponloss the standard and bearing standard with the standard and and naked stalkes stand gengle, prickly, scaly whirish greene heads, nothing so great as the largestics the plant might promise, from the middle whereof thrush forth divers small purplish threes as is usual inmost his siles, which when they are past the head openeth being sull of downe, having very small whish seed, even smaller then in any other Thiste almost lying therein, which are carried away together with the wade note is composed of many which great stuberous long clogs, like unto those of the Asphodill which saids all winters, with a few greene leaves at the head thereof.

2. Cirsium majous latifolium. The great fost Melancholy Thistile with broad leaves.

This great Melancholy Thistile hath large and long leaves, larger and broader then those of Borge, dented and fet with fost prickles about the edges, the stalke which is tender brittle or easie to breake and cornered hath such like large leaves thereon as the lower are, but somewhat more rent or torne on the edges, branched towards the toppe, and bearing on each of them from among a tuft of small prickly leaves a small prickley. This like list out of which spring many purple threads which passe into downers the scote is small and long with diversions annexed to it.

2. Cirfium alind montaunm. Another foft Melancholy Thiftle. This other Melancholy Thittle rifeth up with divers stalkes about a fooce high, winged as it were or se win filmes from the Potrome, and leaves growing thereon which are somewhat like the art, but narrower dented about the edges set with prickes, and of a pale or blewish greene colour at the coppes of the stalks upon long naked stemmes stand small, scaly prickly, single heads, with purple thrums or threads in the middle, which when they passe into downe bang downe their heads, and conteine within them larger, shining, and knowne seeds then the formost that fall downe or are blowen away into the winde; the root is composed of many long thing, of the thicknesses of the stalks, which though the processes all fields, whethy is of the thicknesse of ones finger, which shooteth forth heads for encrease at the toppe on all sides, whereby a lasteth long.

The former of the in english Thirtles rifeth up with a tender fingle heaving recent fallow heaving thereon four or five long hoary green leaves dented about the edges, the points whereof are little or nothing prickly & and top, usually but one head, yet sometimes from the bosome of the upper mod leave there. Theorem forth matter final ler head which are scally and somewhar prickly, with many reddish purple through or directly and formewhat prickly, with many reddish purple through or directly and formewhat prickly. which being gathered fresh will keepe the colour a long time, and standing on the the

Che from Anglicans primum The first English Citium.

Another foir Melanchely Thiftles

time while it perfecteth the feede, which is of a meane bigneffe lying in the downe : the roote hush many long strings fastned to the head or upper part which is blackish and perisheth

Cirfium alind Anglicam. The other English Cirfium. This other English Cirsium is very like unto the former Englif kinde, whose leaves are as little prickly; but more hoary underneath and more greene above : the stalke also which is about two foote high beareth but one large fealy head with many purple threads and Thiftle like feedes lying in downe: the roote is somewhat tuberous at the head, and blackish on the outfide with divers fibres thereat, and thooting forth long ftrings which fend forth heads for encrease.

Of Cirfum angultifolium Germanicum.

Narrow leafed Cirfum of Germany.

This Cirfum hath divers long and narrow darke greene leaves lying on the ground, dented and fet with a few prickes. the stalke rifeth to be two foote high, set from leafe to leafe with sharpe filmes which make the stalke seeme winged, having shorter leaves, more prickly and more divided on them then those below, branched into many parts, each bearing naked long stems and single small heads at the toppes which are prickly like the rest, and have purplish red threads in the middle of them as the others.

7. Cirfium montanum capitulin compactio. Mountaine Cirliam with tufted heads.

This mountaine Cirliam hath fofter leaves then the former, and fomewhat more cut in on the edges, being long and fomewhat narrow, and fet with small prickles: the stalke rising to be two or three cubits high hath divers the like leaves thereon but leffer and leffe divided, bearing at the toppe a tuft of ma-ny small scaly and prickly heads set together with purplish red threads in the middle : the roote is made of many long strings and abideth long.

The three first forts grow in those fields that are on the mountaines in Germany in many places the fourth and fift in many moist medowes of our owne Land as well in these Southerne as in the Northerne parts the first was found on the hill Walferfall not farre from Baffil; the last by Mompelier in the moist grounds neare the sure

All these Thistles flower about Iuly and some in Angust, their seede ripeneth quickly after. The Names.

It is called in Greeke wis mor and not welmer as divers suppose for it commeth from wis out it, varices que faun me Dioscorides refert, the Latines also call it Cirsum and some Spina mollie, Fuelsius, Ruelius, and Lonierus in ther times thought that the great Buglossum was both in outward shew and inward qualities not much differing from it, but herein they were much mistaken as Matthiolus observed and objected against them. Libel supposed that none of these come so neare the description of Diescorides his Cirsium as the third fort here expessed. Thesis Clusius maketh his first Cirsium, whereunto the former Gardans buthosus Annspeliunsum was like, which Zaminus calleth Cirsium maximum Ashbodeli vadice: the second is the first Cirsium of Dodonaus, as Lugdanensis setten it downe from his French booke, and the third in his Pempeades, which Baubinus calleth Cirsium Laissium, making it another fort, whereby he confoundeth the next which is my third together, which is the first Circum of Description nanther fort, whereby he confounded the next which is my third together, which is the first of the news in his Pemphades, and the third Cirfum of Clufus which Bankinus calleth Cirfum fundamentation wis: the fourth and fift are generally called Cirfum. Anglicum primum and alterium, and of Clufus Cirfum Pausnicum primum pratesse, and Cirfum Anglicum or Britannicum secundam, the first Bankinus entiment Cirfum angulation in the last is the Cirfum of Matthialus, Gesner in horses, Lacuna, Lokel and Englangists, and is the second Cirfum of Dodoneus in his Pemphades, and the fourth of Clusus, which Bankinus called Cirfum fells up his in the second of the compassion of the second control of the second floribis compatis. The Italians call it Cirfis and fo doe all other nations but with little varying temperation, and because I would have it beare an English mame in some fort answerable to the effects and use I have entitled it. The foft Melancholy Thiftle.

The Vertues. There are no other properties found out or knowne whereunto any of these Thisles may be applied the lad which Dissertides setreth downe taken from Andreas (who brought in many figurests and appruties to be used in Phylicke) that the roote thereof being bound unto the veine in the legge or other parts of the body fwollen with Melancholy blood doth quickly helpe and heale it.

CHAP. III.

Acractylis. The Distaffe Thistle.

His Availylis or Distaffe Thissie is accounted a wilde kinde of Cnicm. The forts whereof I have fer forth in this Booke here before, and the Cardom Benedittus Blessed Thissie in my former Booke accounted another fort of this Avrattylia, which I shall not not neede to describe againe; the other forts I shall shew you here. 1. Atractylin flore laten. The yellow Distaffe Thistle.

the wide baltard Saffron or Diftaffe Thiftle (for fo ir may by both names fitty be called) hath the lower leaves the wide baltard Saffron or Diftaffe Thiftle (for fo ir may by both names fitty be called) hath the lower leaves the wide baltard Saffron or Diftaffe Thiftle (for many by one), and which can be the called of the wishey are young; plus before the maine aneural pour tuen are narger and more prickly, and still the higher, the set surface the main and branched, from an surface the bash at the ron of every branch of the last at the ron of every branch of the last at the ron of every branch of the last at the ron of every branch of the last at the ron of every branch of the last at the ron of every branch of the last at the ron of every branch of the last at the ron of every branch of the last at the ron of every branch of the last at the ron of every branch of the last at the last at the ron of every branch of the last at the ron of every branch of the last at the last a sucharpercunia y stances, the top of every branch a few smaller, but more prickly leaves, under every prickly staiddeupwards, at nath at the rop of every branch a few smaller, but more prickly leaves, under every prickly hist with from the middle of them shoote forth a few pale yellow threads, which are the flowers, and being which it is middle of them shoote forth a few pale yellow threads, which are the flowers, and being which it is middle than those of Chicus alter Cluff lying in downe, but nothing so much as in it: the roote is whitish and weather than those of Chicus after seed time a the leaves hereof before they grow hard and old being gent-history was the support of the season of th

h india out not of the service. Purple Distaffe Thisle.

Arrally in flore purpures. Purple Distaffe Thisle.

This Thisle different from the last in the flower, which is of a The Thruse unrecent from the sant in the nower, which is of a split redeblour, and in the leaves that they are not hairy or hoary, and intellalke that it riferth feldome so high, in all other things it is black, reaeven in the bloudy, juyce also, that one would say it were the very fame.

3. Atractylii purpurea Cypria. The purple Distaffe Thistle of Cyprus.

The Thiftle that Anguitara Setteth forth, and Zugdanenfis after him bublewe like unto the manured Cnicus, or bastard Saffron, but leffor sales what rugged or crumpled, from among which rich up a falls, baring a Thift le-like head at the toppe, from whence fpring flowerbaches, bare or without leaves, halfe a foote high or more, indertrances, pare or without reaven, make a roote night or more, bring on ach of them a small prickly head, with a purple flower in the middle (like unto an Avenance, as they say, but how truly I cannot all but nother places enclining to yellow: the whole stalke and braderise to a cubits height, and have white seede like unto Ginzales. or of baltard Saffron, The Place.

Clufus faith he found the first in the corne fields of Sevill and Cordinto make remain the found and third grow in many countries, as about Maplier, and Narbone in France, in Italy, Greece, ere, the last is faid in desilers to be found in the Ile of Cyprus, and Lugdenessis faith it is is losted in France, but somewhat differing in the colour of the

They flower towards the end of Summer, and the feede ripeneth in thend of August, yet the last dorn flower and feede sooner than the aper locur

The Names

The yellow Diftaffe Thiftle.

tel miles the Arabians call it Kartam, from whence the names Comban is deduced, whereby it is knowne in the Apothecaries shoppes, hereof there is two principall kinds, the manued or tame, and the wilde, as Discorides, Theophraft in and Pliny, from them doe fet downe; of the wide kinde there are two forts recorded by Theophrastus, and Pliny from him, the former more upright, and like mothe manured kinde, which of divers is taken to be Atrallylu, the other trailing on the ground, and more like a Sowthiftle, which of all in generall is taken to be our Cardans beneditine, unto the former Theobut giveth'a blacke and a greater fruit, and more bitter than the other: but Pliny unto his former giveth a wing greated bitter feede, which because that Pliny faith the former Cnicus sylvestris was called Atractylu, white much controversic among many worthy Westers, some affirming the Cnicus sylvestris prior to be Atractylu, and others refusing that opinion, because that Theophrasius speaketh distinctly of them both in severall plants. results a training that opinion, because that Theophrafts speakers distinctly of the both in the daily observe the same that Massiviolanus enter that there are many things with places in Theophrafts (Guilandinus in Pappre, giving this note, that there are many things with places of in him, by sundry names I shall certainly finde that the Atrastylis here set downe, has is the same Atrastylis with him and Disserved, and the Cnicon specific prior of Theophrafts, and is weightlanding, the divers relation of the same at the same Atrastylis with him and Disserved. building that could they any Coicus files frie with a white feede; and our Atractylis doth to fitly answer in

all things thereunto, the feede being blacke and bitter also that none can doe more, as also in that property proliar to Atraliziu, as Theophrasius recordeth, which yeeldeth a bloudy juyce as ours doe, and therefore, as he is to
other herbes are taken, but droppeth out of the verieus of the leaves of it owns actord, being broken off such in the fame manner as I have shewed you here before the juyce, as the juyce any thing to receive it, in the same manner as I have shewed you here before the juyce of slows in ground, and young, or before they grow hard and splesse upon the stakes when they are old; for both leaves sales, as young heads being broken off will yeeld that red or bloody juyce. The Atralizius is in some copies of Dissemble as Matthiolus sheweth, called Cnieus sylvens, and derived from are well, it is so some manner as I have sheweth sales as Matthiolus sheweth, called Cnieus sylvens, and derived from are well, it fusions, whereupon Gaustush.

Rocke or Distaste, yet Columnus thinketh it tooke the name from the head, which being stored, as he said with and thereupon some called it also Colus rustica, how soever Masthiolus thinketh, that the diversice of the same and thereupon some called it also Colus rustica, how soever Masthiolus thinketh, that the diversice of the same cient Authors themselves, wie, either for a Rocke or Distaste, or for a Spindle. The first here say do gilled by the control of the same state, which be said the same state should be considered to the same state, which seeme should certainely ded, and form him Camenta, but the Atralizius which he don not so acknowledge, but maketh the Atralizius of Natibilus (whom Camenta, purparea by many Authors, but Bankinus in string to shew a Cuicus specific of Callistus, which is acknowledge by Cameravius to be a faile one) to be the true Atralizius of what the Atralizius of Callistus, which is acknowledge, but maketh the Atralizius of the same should be called and maketh the Atralizius of Columnus, when as a slow proper than should represent

The Atractylis, as Galen faith, is of a drying faculty, and moderately digefting. Dieferodes faith that they fall feele no paines of the stinging of the Scorpion for so long as it is held by them, but that the paines returne as some as they lay it by. Pliny faith that it helpeth greatly against the venome of all creatures, as also against the harme that commeth by eating Mushromes: I finde no propertie expressed of the other bastard Sassino of Classe. The properties of the Spaniss Sassino or garden bastard Sassino called Cniens, is briefely set downe in my former book but because I was therein more short than was convenient or expected, I thinke good to set downe in my former book the total I was therein more flort than was convenient or expected, I thinke good to set downe the venues thereof in this place somewhat more amply. Galen saith little of it, the seede onely, saith he, is also doely for purgations, and is hot in the third degree being outwardly applied; but Melnes speaks there is paging through the sammer: it is not in the first degree, and dry in the second; the pulpe or kernell of the seede is chiefly used, yet the sower is not unprostable, which being taken inwardly purgeth segme and water by vomit, and so do this so being used in a glister, which therefore is prostable against those diseases are bred thereof, as also be collected and the like: it cleanseth the slomacke and lungs of tough stegme sticking therein, especially being made into me Electhary or Lohoc, with the coyle drawne from the seede, which also maketh the voyce cleare that was harse, as also encreaseth the sperme, it be much used, but it is of evill nourishment, very hurtfull to the some make in the smaller of the seede be, or of those that are more forcible, that is, Cardanomes, Ginger, and Salgman, which quicken his operation, and preserve the inward parts from harme: the slowers thereotaken with sweete wine helpeth the jaundise, for it cleaseth and openeth, yet in a meaner degree than the milke bete, (which I understand to be the

CHAP. IIII.

Acama. The Fish Thistle:

Ecause this Thistle is said to be so like unto the Arratiglia and Colons that it might be the same onely differing in the colour of the lease and juyce, I thinke it not amisse to joyne it next the colour but because the ancient Writers thereof, which are Thisphrassus and Piny have been very brief in the description thereof, or rather have given none at all, or but by comparison, the modern union have referred divers Thissles thereans as every ones opinion led them, of all which is isot amise to speak in this Chapter, and wishall to show you which of them is held so come neverth antochast of the increase.

This fill This has many leaves lying in a compasse upon the ground, smaller, narrower, harder and more pitis the bath many leaves lying in a compasse upon the ground, smaller, narrower, harder and more pitis then cither Coicus or Atratis of a yellowish greene colour on the upper side and grayish underneath, pitis the pities are small and yellow, and when the stalke being one or more riset up are fer thereon on all sides when toppe without order; where it brancheth forth into two or three parts bearing small prickly heads, from small court forth the slowers composed of many small leaves of a yellow colour standing as a pale or border when come yellow thrum, in forme of an Aster or Starrewort, which when they are pass the seed being small branches yellow thrum, in forme of an Aster or Starrewort, which when they are pass the seed being small shows not yellow thrum, in forme of an Aster or Starrewort, which when they are pass the seed being small shows the start of the standard of the shows the same of the seed of the shows the start of the same shows the sa

2. Accordance purpose or norms pariso. The first that with the detection nowers, and fet with finall Thiffle hath shorter and broader leaves then the former denied or cut in on the edges, and set with a finally prickes greene on the upper side and grayish underneath: the stalke riferth nothing so high as the forms the prickes greene on the upper side and grayish underneath: the stalke riferth nothing so high as the forms sing smaller leaves thereon but not lesse prickly and such take heads and flowers at the toppes as in the sharp stalked the stalker of the stalker stalker.

The Neapolitane Thiftles lowest leaves are five and on the ground fomewhat like unto the Atraciylis or distasted but broader and set with more and sharper prickes, from the middle of whom rise up divers somewhat his bit broader and set with more and sharper prickes, from the middle of whom rise up divers somewhat his bit broader and set with more and sharper prickes, from the middle of whom rise up divers somewhat his broader and set with more and sharper prickes, from the middle of whom rise up divers somewhat his broader and set with the state of the last but a tuft or umbell of many small prickly heads set together with the state of the blacke Chameleon Thistle, and out of them rise small leaves as beards of step yellow colour set about a middle thrusn, of a paler yellow colour, the milkie juice that this giveth being contented as and made thicke is like unto Gum.

injunctiate and made tricke is the chief Suith. Round headed fifth Thiftle.

This Globe Thiftle is a small plant about a foot high shooting forth from the head of the roote which is long added many leaves some of an inch or more, or two inches long, and scarse halfe an inch broad, much cut in on the death and thicke set with prickes, growing round about the stalke without order, at the toppe whereof is set at many head, extred as it were all over, and composed of many very small ond narrow leaves, a sined on both sides with long sharpe prickes, out of whose middle startest forth a small yellow slower, from the toppe of which half singeth forth sometimes two other stalkes bearing each of them a round head like the other but lesser; the whether yof the plant consistent in those round heads somed like a net.

who come of the plant comments in the case foliofo. The low fifth Thiftle with winged stalkes.

The like of this low this lie winged from the bottome to the toppe that is having a jagged prickly filme see on both sides thereof, and long narrow jagged prickly leaves two set at a joyat, from whence it brancheth forthis diverplaces unto the toppe, and bearing thereon shining yellow flowers like those of Cnicus or Arrally is ri-

TRIBEG up from it, among which at the latter end of Sommer commeth forth a fhort stalke scarse two inches long tenter on a large round scaly and prickly head with many bright purplish threads rising out of the midde, which abide in their colour a long time, and being past among the downe in the head lye many small which or the coloured seeds, somewhat like unto the first Chameleon Thistle but shorter and smaller a theroose ingression.

5. Carfina Sylvestrie major.
The great wilde Carline Thistle.

This wilde Carline Thiftle hath fundry flender round but prickly stalks rising from a small long roote, bearing divers narrow long leaves thereon very prickly and fomewhat like unto the former Carline Thiftle, but lesser, and at the tops of each a flower, whose bordering leaves are yellow and the thrumme reddifh.

CHAP.5.

970

6. Cardum pinea seu Ixine Theophrasti.

The Pine Thiftle. This brave Thisle hath a long thicke blackish yellow roote. of the thicknesse of ones thumbe, growing smaller downe to the end, but white within, smelling sweete and tasting hot, fomewhat like the Carline Thiltle, but of a weaker and pleafanter smell: the many leaves that rise from thence are long and of a fingers breadth, with a middle rib therein, somewhar like to the leaves of Cyperus, but harder whiter and broader, without either dents, incifure or prickles; in the middle of which leaves lyeth hid a prickley head, armed fully with long prickes or thornes in manner of croffes, which growing ripe hath within it a hard white flockie substance, wherein as also from among the thornes without on the head, issueth forth a yellowish sweet gumme much like unto Mastick of a hor taste. Alpinus faith that both Bellus and Bellonius & Dalechampius likewife took this thiftle to be Chameleo albus, but untruly, for Theophrastus maketh mentio of Chamaleo albus in another place: but faith Alpinus Chameleo albus differeth not from Chameleo niger but onely in the colour of the leafe & therefore (faith he) I doubt not to affirme that the Carlina having blacker leaves then Chameleo albus which hath white leaves is the Chameleo niger, but Theophrastus putteth not any such difference in the leaves to be blacker or whiter, for that hee referreth to the rootes, and the leaves of the white Chamaleon to bee greater and the blacke fmaller then those of Scolymus, and such distinction in the leaves Dioscorides also maketh, but in shewing their differences more amply there Theophrastus saith, that the white Chamæleon

hath no stalke, and the blacke a stalke of a cubit height, the white hath purplish flowers and the blacke variable coloured flowers, and like a Jacinth, which by Alpinus his leave are not to be seene in Carlina, 7. Chameleon niger verus. The true blacke Chamaleon Thiftle.

The blacke Chamæleon Thiftle hath many long leaves lying about the roote, much thinner and leffe picky then the white Chamæleon Thiftle, much cut in also on the edges into many fine parts or jagges, which and stake that rifeth up among them are sometimes greene, and sometimes whitish, and sometimes reddill, which brancheth forth on all sides, and beareth at the toppes of them many small prickly heads in a tust togeth, somewhat scaly, out of which come divers small long blew flowers, ending in five and sometimes in six shape prickly points or ends, somewhat like unto those of the Orientall Iacinth, with five or six white threads in the middle of them : the roote groweth great and thicke at the head ending in many great long strings, and is of ablacking colour on the outfide and pale yellow within, of a most sharpe talte as the leaves are also, procuring ithing, but ning pimples, and almost exulcerating the skinne if the face or other tender part be touched therewith, or if the hands that have handled it doe touch the face as Belloniss hath observed. The Place.

The first is not so frequently found in these Westerne or transappine countries as the second which is use found upon the hills and mountaines in many places of Germany, and the Alpes, where it is generally alten the the Chamzleon Thiftle, though called the Carline Thiftle; but the true Chamzleon Thiftle is more frequents. Italy, Greece, and those parts where the Carline is more rare: the third is oftentimes found in the lame place with the second and oftentimes by it selfe and in other countries also and this wee have observed also that from the feede of the low kind fowen in our gardens fometimes it hath growen high and not abidden low: the form in frequent in our countrey, especially in Kent every where almost, as the former are in others, and it also founds Germany and France, especially the more Northerly parts: the first of many times with us, but the first onely in the warmer countries: the last is found but in Greece and Asia and those hotter countries.

The Time. All these doe flower late in the yeare with us, but in Sommer in their naturall places, but the Carlier Table will well abide the cold of correlimate, although the white Chamæleon will hardly, but the blacke and the Piniftle feldome doe abide.

The Names. The Chamaleon Thiftles both the white and the blacke are called in Greeke square adius gulas, and all rine Chameleon or Chameleo albu & niger (Gaza translateth them both Vernilage) and so called from the value

FRIBE 9. posses of the leaves, Dioferrides faith it of the white, but Pliny both of the white and blacke, the Carline Takis alled in Latine Carlina quafi Carolina, for it is supposed that the great Emperour called Charlemaine hat is called in in his fleepe by an Angel, with the roote whereof he might cure his Army infected with the Physics it is thought as I faid of many to be the Chameleo albus, but of others observing the differences, it with the Plague: It is thought as a land of many to be the Commetee albus, but of others observing the differences, it is the knowne to the ancient writers. Languagemenfix striveth with many words, and by altering and ordering the Greeke textof Diofeorides to prove them both one plant, yet lastly hee saith that many skilfull stribuild did call Carlina Ixine Theophrass: and so doth Fabius Columna indeede judge, and that the Ixine spina string in the string spina string strin affinite then with the Chamaleon albus of Diofcorides: and that because as it is likely hee never saw the whom comme then which is a much differing plant; but Diofeorides faith the white Chamgelon Thiftle wide Lieby fome in his time, because in some places there grew about the roote a kinde of birdlime, which we weem feel in feed of Masticke, and Pliny saith the Cretanes especially tooke a little there of after supper, the woman in the case of the control min. Chapter, and the roote of the white Chameleon is faid by Diofeorides to be an Alexipharmacum or counmorfor, to that it or any thing growing from it can no wayes be accounted deadly or dangerous but that clamper birdlime (call it what you will) indeed that groweth at the roote of the blacke Chamæleon is truly angunous manufacture of the state of the sta is this Cruzzion) and as it is fet downe in the divers appellations of herbes attributed to Dioscorides, the blacke rating towards and all of the phonon by some, and Ixia by others, and Cynoxylon. Some also have affirmed as Mat-tion beweth in his comments upon the Ixia of Dioscorides, that Ixia should be the Ixine of Theophrassus whom trompreth effectually; thewing that Theophrastus in discribing Ixine doth not declare any evill quality therein. humorethen lo, he faith that it yeeldeth a Lacryma or Gum that is of a good tafte, and called Acanthine or Spina-in Mafithe because it was so like Masticke, and grew on a Thorne or Thiste, and although as Matthiolus saith, hind not feene any Gum about the roote of Ixine (which hee mistooke for the white Chamzleon both in that minother places) in Italy, yet faith that such was sent him both from Cortusus of Padoa and Galzolarius from forms and faith also that he understood by a Candior Herbarist, that the Fletchers in Candy did use the said Gum inflen feathers to Arrowes as others doe with Glew; Matthiolus fetteth forth the Carlina caule scens (as it singled by the best) to bee the true Chameleo niger of Dioscorides and Theophrastus, although himselfe findeth founder therein and likewise impugneth that which Maranea sent him from Naples, as not answering the description theteof, which is now received by the most fudicious to bee the indubitate blacke Chamæleon. Cobesignment to thinke in the discourse of Chameleo albus and niger that Itia (and not Ixine) was a small low plan, more specially seeing with the blacke then the white Chamzleon, especially seeing that Dioscorides in the end of in Preface to his first booke numbreth Ixia as well as Chamzleon among the roots that are venemous. The first befridown is the Chameleo albu Apulu purpiese fire immifer of Columna differing from the usual Carlina viidis taken by many to be Chameleon albus as is evident the by description, it is also the Chameleon albus gimmi wills fire from of Henorius Bellus, expressed in his first Epistle to Clusius; but Banhinus calleth it Carlina acantis imifra, whereof I much marvaile that he foold continue that opinion of Chameleo albus and Carlina to be bubble one plant, knowing that Columna shewed them plainely in his booke to be different, although that Carimm well as Chameleo albon giveth a like gum alfo: and that Theophraftus his Ixine hath fuch likewife which Change is fayd being deceived thought to be Carling the fecond is the Carling humilis of Columna, taken by him white Ixine of Theophraftus as Anguilara did before him and Dodoness, and called by Lobel Carlina herbasiorum (mininght by him & Clufius to be the Chamalon albus of Dioscorides as Guilandinus in Papyro did thinke before) whole Mathiolom, Cordus and Lugdonensis, by Cesalpinas Carlina oulgo, and by Gesner in hortis Cardopatium caule will, by Fricius Cordus Cardoun in former times which spina Arabica, and by the Monkes that commented upon Mesues Acanthe lence of Dioscorides, and by labin Coslina scanlos magno slove: the third is the Carlina caulescens of Columna and Camerarius both in hortis with the Carlina acantos magno slove: the third is the Carlina caulescens of Columna and Camerarius both in hortis Min Epirome by Dodonani Carlina five Leucacantha, by Cefalpinus Carline alterum gensie, by Clusius Carlina ma-To this by Lugdanen is Carlina cautem babens, and taketh it also to be Crocodition, by Gefner in bortis Cardo-film for also cautem babens, and called by Lobel Chameleo albus cautedonains, but Chameleo niger by Lacuna, Manufigure as Banhinus faith in his Matthiolus Ebermurte, that is, Apriradix (and from hence came the name dColoni Smarins) and Cardopatis, but in his Pinase he referreth this name of Brunfelfius unto the Carlina acau-In him it feemeth the Germanes call both forts Ebermante, he himselfe calling it in his Pinax Carlina caulepriming fore, and in his Matthiolus, Carlina caule donathis; the fourth is called Chamelton albus seu exiguus by Tomund Lagdanensi, and parous by Louicerus, by Columbia Chamelton Septentrionalism exiguus appellate, by Isbel Cardaus acauly Septentrionalism, by Clustus Carlina minor purpures flore, who saith that some privileging that it did not seeme unlike unto the Chamelton of Theophrasius in his sixt Booke and third than the said of mariad by Bauhinm Carlina acaulu minor purpureo fore: the fift is the graina fylvestrin vulgaria, the first standstring of Dodoness, and the Acarna vel Cirsun spires Sequenorum of Lobel, &c. the fixt is set forth by minis book do plantin exoticis, and called also by him as Gaza did Cardons Pinea, but is not, although some-state the lates pinea called pumils Narbon of Lobel, the task is called Chambleon niger Dioscoridis by Anguilara Maraha. Musha, Corusiu, Camerarius, Lobel and Columna, and Chamaleon niger alter by Matthiolin, Chamelton niger and Datchampi by Lugdunens, but thought to be Crocodilian by Tabermontains, and called by Baubinus Chamelton for caraltee by descriptione. The Iralians call the white and blacke Chamaleon Thisle Camellatus for caraltee by descriptione. The Iralians call the white and blacke Chamaleon Thisle Camellatus for caraltee by descriptione, the Spaniards call both forts Cardo pinto, the French and white Charline and Chamaleon plane, but the blacke Chardonnette; the Germaner as is said before call all the Camella Characters as the Dutch doe Ebemortele, and wee in English Chamaleon Thisle or Changeable Thisle, which the Dutch doe Ebemortele, and the rest accordingly. parties the Duce doe Reservers, and the reft accordingly. O000 2

The Vertues.

The roote of the white Chameleon Thillie, faith Disservices, taken to the quantitie of a spoonefull intelligible the based warmen in the bally a drawing the chameleon. The roote of the white Chameteon 1 miles, said Superior in the belly: a dramme thereof taken in the weight of the said wormers in the belly: a dramme thereof taken in the belly a dramme the wherein Origanum nath Deene boyett a met it to blow the decoction thereof is profitable for them that canon me helpeth dropsie persons, for it extenuates their peny the decoction thereof our into peeces & hung up on single water orderly; Theophrassum and Pliny from him saith, that the root hereof cut into peeces & hung up on single drie, & afterwards boyled in broath, or otherwise taken doth help the defluxions of rheume that fall from the base. drie, &afterwards boyled in broatings of the whether a ficke person should die or live, if better the cycs, teeth, note, or lungs. It any, said the, would the windless and or not die; it is as a Treakle or an and endure three times washing with the decoction of the roote he shall not die; it is as a Treakle or an animal of the control of the and endure three times waining with the decertion of the topoled that the Carline Thill le roote was used against poison being drunke in wine, and from hence it is supposed that the Carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison being drunked by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline Thill le roote was used against poison by the carline the plague in the Emperour Charles his army (although it be fuggested to be declared by an Angell, withough the plague in the Emperour Charles his army (attnough it or negetical to be declared by an Angell, without a Allegory or allufion to the good Angell from due observation and practile, which hath since found it very default both to resist the infection, as also very powerfull against the bising of a mad dogge, or the sling of sepents, and yet Disservates saith, the roote of Chameleon albus given to dogs, swine, or mile, killen them which propertie is also found in divers other things, as on the contrary side divers creatures do feed on the side when the contrary side is to give the inches the second of the secon are poylonous to men. The blacke Chameleon Thiftle is faid by Dioscorides to cure the itch, the roote being to men. and mixed with Axungia and so used, and being boiled in vinegar and some brimstone put to it killed turn and ringwormes: it clenfeth the face and skinne from all blemishes, deformities, and discolouring being used with fing wormes; it cienters the late and same state and strings that doe digest and mollisse, and also with those that confine and eate the sless, and therefore is used to helpe soule fores, and stincking users; hereby you see he doth not appoint it. to be used inwardly for any disease, by reason of the virulent qualitie therein, but onely alloweth of the denoting thereof to gargle the teeth in the extreme paines of them; or by the roote braifed and boyled in vinega to helpe the tooth-ach and to breake them if they be touched therewith. Of our wilde Carline Thille I have not knowne or heard of any that have made any experiment, although I am perswaded that it commeth nesse to the collision of the low Carline Thiftle, that is so much commended, as you heard before and of the gummes, either of the white Chamaleon or Carline Thiftle, there is no other speciall propertie set downe by any than is declared be. fore, that as it is called Malticke of the Thiltle, fo it is used as Malticke to chew in the mouth, both to amend the evill favour of the breath, and by reason of the glewing qualitie to stay rheume, and to strengthen loose tent; for the juyce doth follow the propertie of the herbe or tree from whence it is taken and although the gumme of the white [hamelon be called Ixia, as Dioscorides faith, yet the Ixia that is poyfonous is another thing quite diffusion from this, for neither Dioscorides nor Theophrasis doe attribute any venemous or evill qualitic thereum. Other qualities both of the white and blacke Chamaleon Galen in 8. simplicium med, faith thus : in the roote of the blacke Chamelenion Thiftle, there is somewhat that is deadly, and therefore the use therof is outwardly for seas, inhere tetters, &c. and to clenie the skin : but the roote of the white Chameleon, Thiftle, befides that it killeth the broadwormes in the body or belly; it is given also to those that have a dropsie, and is somewhat like in the temperature unto the blacke Chameleon, but that it is more bitter than the white. Paulus and Line in their Treatife of the fons, after they have spoken of the poysons in both forts of Chameleon Thisle, and of their cures, doe exercises the poylonous Ixia in the fame manner that Diofcorides doth, wherefore we may conclude that Ixia bath a double interpretation, and doth as well fignifie the harmelesse gummes of the white Chamalton and Carline Thilles, as the poyfonous gumme or roote which is deadly: but because we are not sure that it is taken from theblacke Chemeleon Thiftle, I thinke it needlesse here to set downe the cure of it.

CHAP. VI.

Cattos Theophrafti, ideft Scolymus Dioscoridis & Scolymus Theophrafti qui Eryngium Intenmeft, The prickly or wilde Artichocke Thiftle, and the golden Thiftle,

Fall the forts of manured Artichockes, whether prickly like Thiftles, or not being fit to be eath, I have fufficiently spoken in my former Booke; and intend not further to speake of themagains bur of fome other kindes that are more prickly, and more like Thiftles, whereof there are two three forts which shall be here expressed.

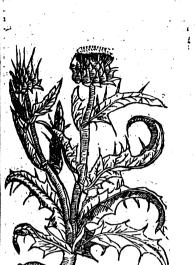

1. Scolymus Dioscoridis. The prickly or wilde Artichocke Thisle. This prickly or wilde Artichock Thiftle hath divers long thicke, hard, but narrow leaves, ending in long points formewhat cut in on the edges, fet with strong and sharpe great prickes, which growing on the stakes compassed. them at the bottome, and are of a darke greene colour 12st the toppe of each flalke and branch flandeth one fally and prickly head, leffer than those of the Chardons that are kept to be eaten, from the middle whereof put form divers bright purplish crimion threads, which after they have stood some time passe away, the seeds in the

heads being flat and like other Thilles: the roote is great and spreadeth much.

2. Cynara Sylvestria Gretica. The Candy wilde Artichocke. This wilde Artichoke from among the long and hoary white leaves somewhat broader than the former, on in on the edges, and thicke armed with long & tharpe prickes, rife up fundry round stalkes, fet with box few leres, and branched into two or three parts some times, at the toppes bearing small scaly sharpe prickly heads, which are eaten by the Peasants of the countrey, both greene and boyled after the scales and sharpe prickles are deared, with the countrey and the countrey are the scales and sharpe prickles are deared. with falt, oyle, and pepper, and are as pleasant to their palate, as a daintie Artichoke to ours : the roote is very long, and groweth deepe.

3. Scolymus Theophrasti five Eryngium luceum Monspeliensium. The golden Thille.
The golden Thille shooteth forth divers skinny & prickly stalkes, which in some places, as Spain, Section 1977. right, and in other countries, as Mompelier, and ours also, bendeth with them unto the ground, benie acress joynt both a branch and a lease, which islong and somewhat narrow smaller at the bottome than any which islong and somewhat narrow smaller at the bottome than any which islong and somewhat narrow smaller at the bottome than any which islong and some control of the some places marked with white spots and etc. In my garden none at all a ribe joynt betweene the leaves and it had any and at the roppes also come forth some land at the roppes also come forth some land. and at the toppes also come forth severall imail heads, smaller than any of the former, composed of

where it grew did there build his City : but Didymus in Athenaus faith it was the Course from frei, the where it grew did there pund no City : but Despired in Assemble series Play the Gray to the Bryer bush, but the Scotymus of Theophrasius was not knowne unto Diese within the westness that the series of the waste both one cleant giving the westness that Bryer bush, but the Scotymus of a respection was not known to the plant, giving the vertues of both sumous deth both the kinds of Scotymus together, as if they were both one plant, giving the vertues of both sumous deth both the kinds of Scotymus together, as it they were both one plants, giving the vertices of the authorized and faith moreover that the Scotymus of the Grecians is called also by another name Liminium, which into and faith moreover that the Scolymns of the Grecians is called also by another name Limmins, which he received a first slib. 6.5. II. which Great very fallly transfateth Betasylvestris, whereas Theophysisms, breth it among the Thistle-like plants, and is a differing Thistle from Scolymns set downe in the same place Le limits spivestris sive Chamaleontha Monsfeliensum, and Lugdanensis Scolymns Dioscoridis, but Banings, limits spivestris sive Chamaleontha Monsfeliensum, and Lugdanensis Scolymns Dioscoridis, but Banings, spivestris latissis at the second is called by Henorius Bellus (as it is set downe in his second Epitle to Clipsis) on any affirment of the Cretical as the Cretical as the second Epitle to Clipsis of Cretical, by Banings Cinara spivestris Cretical, and thinketh it may be the Cinara spivestris Retical Clipsis for the last is called by Clusus Scolymns Theashras of Clipsis, for the last is called by Clusus Scolymns Theashras of Clipsis, for the last is called by Clusus Scolymns Theashras of Clipsis, for the last is called by Clusus Scolymns Theashras of Clipsis, for the last is called by Clusus Scolymns Theashras of Clipsis for the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theashras of the last is called by Clusus Scolymns Theash and the last called by Clusus Scolymns Theash and the last called by Clusus Sco Creiua, by Baubinus Cinara sylvestris Cretica, and thinketh it may be the Cinara sylvestria dente of Cinara, in downe in his Cure posteriores in quarto, fol. 66. the last is called by Cinsus Scotymus Theophrassi (wherein the vert two figures, the one of the Spanis plant growing upright, the other of that which groweth at Markin leaning downewards, and called by him Narbonensis, whom Dodonans followeth, giving both his signed and calling the one Cardas Chrysathemus, and the other Cardas Chrysathemus and Taberment and Calling the one Cardas Chrysathemus, and the other Cardas Chrysathemus and Taberment and Santial Cardas Chrysathemus and Cardas Chrysathemus calling the one Carans Cory, an interior, and the other owners of flavorers and Tabermons and Out Long (who also saith it is the Eryngium luteum Monspellensium) Camerarius, Cafalpinus and Tabermons anns, Angalam olleh it Eryngium Vegety, and Bellonius saith it is called in Candye Association, and by the Latines Gyornham when faith, wherein I thinke he is deceived, Baubinus calleth it Scolymus Chry anthonos, and faith it is the Atrabilit marina of Lugdonensis, which as I said before in the Chapter of Atrastylis, he saith was the Picuous of Living Pena, and yet as I shewed you in the Chapter of Acarna he maketh it an Acarna likewise, calling it Acara he. milis caule foliofo, but it cannot be both an Acarna and Scolymus, this double denominations of plants is not greable to Diescorides minde, who is never found of himselfe to name one plant in two severall places on call one plant by two feverall names, although he fnew the divers appellations of others. The Italians as Belings faith doe in agro Romano call the last Spina bords, and thinketh it to be that plant which the ancients did call Gicyrrhizon, the Spaniards of Salamanca did call it Sylibnum, but as he saith it cannot bee Sylibnum of Dissensit; and in their owne Language Cardon lechal or lechar, id est, Carduns lattens, because of the white spot upon the leaves : the French call the first Chardonnette.

The Vertues. Dioscorides faith that his Scolymun is good to expell ftrong and ftinking Vrine, and to amend the ftrong or ftine king favour of the Armeholes, or of the whole body, if the decoction of the rootes in wine be drunkenthe young shootes also are eaten like unto Afpharagus, and the young heads also in Spaine before they flower: but they me to raise up the earth over the young shootes untill they bee-risen to a good height, which then are not onely white but more tender and delicate, to be eaten raw as their usuall manner is with Oyle, Pepper and Salt, or boy. led or stewed : the flowers are used by the Italians as Lobel and Pena say to curdle milke, whereof they make Cheese, as also are perswaded that the sayd flowers given to women with child in their broth or to drinkedoth hinder aborfment, and cause them to goe out their full time in good plight, and also is very good for those that doe not teeme or are barren, and cause fertilitie. The Cretanes used their wilde Artichoke in the same mamer that the Italians, Spaniards and French use their Cardons or Chardons. Theophrass mu also faith that the root of his Scolymus is most pleasant being boyled or eaten raw, but then chiefly when it is in flower, as also that the inner substance of the heads are eaten. Clusius faith that they of Salamanca use to cate the young plants roots and all, being washed eyther raw or boyled with sless, and that with the milkie juice thereof they doe congulate or curdle any milke, and with the flowers doe counterfet Saffron, for the like uses as in other places they doe with the flowers of Baftard Saffron.

CHAP. VII.

Acanus Theophrasti. The ancients Thistle.

His Thistle riseth up with a great thicke prickly stalke three or foure foote high, branching sortion all fides from the very bottome, fet at the joynts with fomewhat large leaves, broad and long, out all indes from the very oottome, fet at the joynts with somewhat surge searce, seek the toppes of the bracker in on the edges, and fet with sharpe prickes at the points and corners at the toppes of the bracker in on the edges, and fet with sharpe prickes at the points and corners. come forth severall small Thistle-like heads, out of the middle whereof thrust forth the flowers, compoted of many deepe purplish threads, after which come somewhat round and flat seede, of abownish colour lying in downe: the roote is thicke with divers long strings at it.

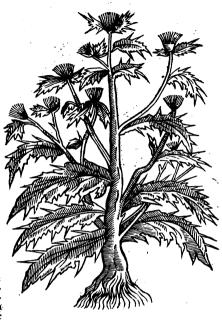

The Place. It groweth in Candy from whence the feede hath beene fent into divers other parts of Europe.

The Time. It flowreth in the end of Sommer, that is, somewhat late as other forts of Thillies that come out of hot countries.

The Names. It is called in Greeke A'ro G Acanus, which doth as well fignifie a peculiar plant of it selfe, such as this Thifile here fet downe as the head of any thiftle, or any other Thiltle-like head of any other plant; Thespress. onely (and Pliny from him) making mention both of this and that, for in his first Booke and sixteenth Chapter he nameth it among the outhandrow, those plants that beare prickly leaves, thus, deepen of yours, i deepen minimum his sixt booke and fit Chapter, some said the, have prickly leaves as o deep of proposer, which and then making demus to be the head of a Thistle also (which Dioscovides calleth aris of Ethians from whence comment Ethians, as from Acanacea signifying all Thistles or Thistle-like plants) in his ninth Booke and thirteen Chapter, where speaking of the Chamzleon Thistle he faith thus, we demons despress and the capter plants of the chamzleon Thistle he faith thus, we describe the despress of the control of the capter of the capte caput hujus magnum Acano simile, unde quidam Acanom dixerunt, and in his sixt Booke and fourth Chapter speak

Achanni Theophrafi. The Thiftle of the ancients.

gol laim be faith, and N vie fle as wone à arrowar incoanges ism se pinar, de media radicio feminalis acanus veluindustrial crate, and therefore a griffer doth fignific as and keeping ferre, as in the fame Chapter hee faith min des (u Aacnum (idest Acanaceum caput) fere Chawhen the Chamzleon beareth a Thiftle-like head; but the thing to the the carreffed should bee thought to bee dring I man to the phrashes, feeing hee hath there-dring Acans of Theophrashes, feeing hee hath there-dring description, as being then so well knowne that derean deteription, as being tuen to well knowne that bettingst it needed none, Honorisis Bellus in his fift space of the Inhabitation of the Inha othe Thilles, in the fame manner as Theophraftus doth down i manager as is showed before a and then that the name is heart as is increased serious a and them that the name desents but a corrupted word from Acano, for the name and largest of the Greanes is a baltard or corrupted Greit frech: both which reasons are not onely forcea-Security to confirm any ones opinion in this truth; m his eight member and 128, page of his com-Gulatian in his eight member rufh, after that he had fhewwhat Theophraffus used divers names for one thing (in son whereof by his leaves hee is thought to be miltaken) with the laine of Theophrastus is his Acanus also, whom Honorius Bellus although hee had beene his scholler ontradicteth, not allowing of that opinion for the reasons storied. Play faith lib. 12, c. 3. that fome thought the hour hould bee Eryngium being a broad sharpe prickly believel broad thornes. I cannot finde that Anguilara a Ludanniis did know any plant peculiarly called Acami, although Banhinus fetteth them both downe to call this plant to, but that they tooke the name onely to fignifie the pricily head of Thiffles : Pone in his Italian Baldus giveh the figure thereof fomewhat rudely done, but no wher description then that of Honerius Bellus in the place storfaid, Baubinus calleth it Carduus latifolius echinos ob-Mas purpura ferens: because I could not finde a more proproppellation to call this Thiffle by, then that I have given of the ancients Thiftle in English, I will not refuse to alter irifany can give it a better-The Vertues.

lumothideany propertie peculiar imputed to this Thillie by eythar ancient or modorne writer, and therefore will I can be better informed I must be filent as others are.

CHAP. VIII.

Silbum five Carduus lattens. Our Ladies Thiftle, or the ftript milkie Thiftle.

Lihough formerly there hath beene but one fort hereof knowne to Herbarilts, yet of late by the diligent learch and observation of some that have beene curious, there are some other sorts found which together must be handled in this Chapter.

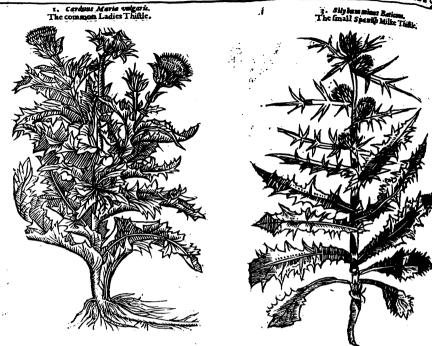

I. Carduus Maria vulgaris. The common Ladies Thiftle. The common Ladies Thiftle hath divers very large and broad leaves lying on the ground, cut in and Bixtrectumpled but formewhat hairy on the edges, and of a white greene shining colour, wherein are many lineral first es, of a milkie white colour running all over, and fer with many fharpe and stiffe prickles all about, among which rifeth up one or more strong round and prickly stalkes, fer full of the like leaves up to the toppe, where the end of every branch commeth forth a great prickly Thiftle-like head, ftrongly armed with prickes ad with bright purple thrummes rifing out of the middle of them: after they are past the seede groweth in the had bad lying in a great deale of fine foft white downe, which is somewhat flattish and shining, large and bownertheroote is great spreading in the ground with many strings and small sibres fastned to them, all the The plant is bitter in taste and therefore supposed not to be without very good effects.

2. Silybum majus annuum. Great Milke Thistle of a yeare.

This hille rifeth up with one round stalke almost a yard high with somewhat large greene leaves, not halfe. htt nickly heads, out of which rife reddiff purple threads or thrummes, and fomewhat great browne feede danuards lying in Downe : the roote is long and perifiseth as foone as it hath given feede.

Silybum minus Baticum. The fmall Spanish milke Thiftle. The full leaves of this Thille are formewhat broad and finally cut in on the edges, of a pale greene colour, with bate (mall white lines and markes thereon having footestalkes upon them, but those that presently rise up with arbille are somewhat longer and broader forwards then below, where being narrow they compasse the stalke

Ta 188 9.

and are more cut in on the edges and fet with some small sharpe prickes, and marked with white lines as the ther, the upper leaves being still more divided and lesser at the upper joynts, and at the toppe come forthvery small prickly heads with purplish thre ads breaking out of the middle, and after they are past comevery small white scede lying in some downe, which by reason of a kind of cleare white Gum that issueth out of the bed, flicketh so fall to the seede that they can very hardly be pulled in funder, especially after they grow ripe and the Sunne hath dryed them : the roote is small and wooddy and perisheth every yeare. The Place.

The first is frequent on every ditch banke in the fields every where : both the second and the last I received among divers other feedes that Guillaume Boel brought out of Spaine, and I believe the last may be the same that Camerarise faith he picked out of Epithymum, and that Ranwolfin gave him brought out of Syria, because the teede being white in both and the leaves marked white doe demonstrate them to be both one.

The Time. They flower and seede in Iune, Iuly and August when other forts of Thisses doe.

The Names. This is generally supposed to be the Sinusor Silybum of Dioscorides, but thereof he hath made so breese a relation that it is hard to fay which is the right indeede: for he faith onely thus, Silybum is a broad Thiftle whole leave are like unto the white Chamæleon : Pliny in a manner faith the fame in effect for the description; but faith in Cilicia, Syeia, and Phenice where it groweth it is hardly boyled tender, and that it hath nouse in Physicke; but but furely the white lines and markes in this Thiftle is fuch an evident note and fo remarkeable, that I thinks it could not be overpassed in silence by all the old writers if they had knowne it and described it : some therefore doe thinke that it more fitly agreeth with Leucacantha and Spina alba: Lacuna, Matthiolus, Cornarius, Delmen, Fuchsim and Lugdunensis take it to bee Leucographie Pliny, Brunfelsius calleth it Cardnu albu and Chaulen, Matthiolus and Lobel Cardum Lattens, fome Cardum argentatu and Cardum camptarius, Tragu, Luicius, Fuchsius, Gesner and Camerarius call it Cardum Marie, Cordus on Dioscorides and Tabermontanus Cardum Merie, rianus; Dodonem Carduns Leucographu, Anguilara and Lobel Silybum, Cafalpinus Cardui fylvefira dindgent and Acanon Theophrasti: but Banbinus Carduns albus maculis notatus vulgaris: the second is not set forth by my author before now, and from the likenesse thereof unto the former, I have so called it as it is in the title, Sipher majus annuum. The last as I sayd I had out of Spaine, and in regard it doth so nearely in all things resemble the Cardius Lattens Syriacus of Camerarius, I pretume it is the same which Bankinus referrete as well a Camerarius to Cardius Lattens or Bedegnar Arabum of Ranwolfins which Bankinus saint came to him by the name him Cretensium, and calleth it Carduns albis maculis notatus exotions; our wilde kinde is generally called Cardun Santte Marie in Latine, by the Italians Cardodi Santa Maria, by the French Chardon noftre Dame, by the German Marien diftel and Franwen diftel, by the Datch Onfer Urowen diftel, and wee in English our Ladies Thisle and milkie Thiftle.

The Vertues.

Our Ladies Thiftle is thought to be as effectuall as Cardans beneditius for all the purposes whereunto it is put, Our Ladies Thisle is thought to be as enectual as Caranus veneatous for all the purposes whereunto it is put, a sundy for Agues and for the insection of the Plague, both to prevent and cure it, as also to open the obstructions of the Liver and spleene, and thereby is good against the I aundies, and provoketh Vrine, breaketh and except the thought of the property o later of the other Chardons and white Artichokes are, and eaten doe neige to encrease milke in Nourses breasts shall also for the paines in the sides, and many other inward paines and gripings: the seed is held as it is shall if not more for the purposes aforesaid and so is the distilled water also, and besides is often applied whimpadly to drinke and outwardly with clothes or spunges to the region of the Liver to coole the distemped with and also no the region of the heart against swownings and ressions of the second of the coole the distemped as and also no the region of the heart against swownings and ressions of the second of the seco homeway, and also to the region of the heart against swownings and passions of it.

CHAP. IX.

Carduns Spherocephalus five Globesus. The Globe Thiftle.

MN my former Booke I have given you the knowledge of two or three forts of Globe Thiftles, that is of Num rounce and the leffer Globe Thiftle, and of the Fryers Crowne Thiftle which is accounted one of them, although the head be a little more flat at the toppe then the reft: there remains some other forts to be showen to you in this Chapter.

Cardans Spherocephalus acutus miner. The smaller Globe Thistle with long prickles on the head. This state of the head.

This state of the head of the head of the head of the head.

This state of the head of th integrowing on the whitish stalke up to the toppe, where stand divers round heads each upon a long footemingroway of Globe Thiftles expressed in the same manner that the two forts of Globe Thiftles expressed in my form Booke doe, but that the ends are longer and sharper, out of which rise more blewish slowers than are in the leffer fort.

2. Carduns Spherocephalus acutus major. The great prickly Globe Thisle. This other greater prickly Globe Thittle hath larger leaves and broader, fomewhat like unto the former great Glibe Thille expressed in my sayd booke being nothing somnet cut in on the edges, in all other things it is non milite the former here fet downe, but that the flowers out of these prickly heads are of a deeper blew colour.

3. Carduus Spherocephalus minimus acutissimis folys. The smallest Globe Thistle with the most prickly leaves This small Thissell Thissell This final the smallest jagged leaves and most cut in of any of the rest, and most sharpely set with widesouthe edges the stalke groweth lower then any of the other, and the round heads at the toppes smaller

Carduus Spharecephalus acutus minor. The fmaller globe Thiftle with long prickes on the head, 2. Cardeus Spherocephalus acutus major. The greater prickly globe Thiffle.

also, but not armed with such long sharpe prickes as the former out of the buskes whereof come whitish flowers.

This This that a winged prickly stalke two soote high having large leaves thereon somewhat broad and long, fet thicke with sharpe prickes, but sparingly placed on the stalkes bearing round sphericall heads, thick and strongly armed with long prickes; out of the midst whereof breake forth white threads somewhat sweete: the seede is long and crested or cornered.

The Place.

All these Thistles are strangers to us, neither is their naturall places certainly knowne, but imparted and sent by friends with whom as rarities they have been accepted.

The Time.

These flower at the same time with the rest, that is, in Iune and Iuly.

The Names.

Wee cannot finde certainely that they were knowne eyther to the ancient Greeke or Latine writers, but Anguilara and Lobel suppose that the first is the A'reiron Ad'un Spina alba of Diescorides (some also take the greater kinde mentioned in my former booke to bee Spina alba, as Camerarius, Matthiolus am Lugdunenfis, which as he faith is the Bedequar of the Arabians; and some tooke it to be xosnosino Crocodilion Dioscoridis as Lacuna and Lobel, and some to bee zanen@ Chalcheios Theophrafti, which Gaza translateth A raria as Lugdunenfis, and some to be rerpant Tetralix spinosa Theophrasti as Lugdunensis, and is called Spinosa as a distinction from Tetralix Atheniensium which is Erica, of both which Pliny maketh mention, and some to be A'zavoa dealin Spina Arabica, as the fayd Lugdanensis also and in some to be P'us @ Rathros or Ruthro Theophrasti as Lobel, and some to be Silybum as

Lugdouensis according to the description, and some to be Chamaleon verus as Tragus and Fuchius, and some to bee Echinopus as Gesner in hortis, but Cordas in historia as I take it first called it Cardans Spherecephain or globosus most properly, and from him Camerarius, Dodoneus also calleth it Spina persyrias, and is so called by many of the said authors: these things I thought good to note here having so fit an occasion, at Spherecephalus acutus. Dodoneus makent the second here set down to be his third Cardaus Spherecephalus acutus: the third is the said Dodoneus makent the second here set down to be his third Cardaus Spherecephalus acutus: the third is the said Dodoneus makent the second here set down to be his third Cardaus Spherecephalus acutus: the third is the said Dodoneus his Cardaus Spherecephalus quartus, and Lugdoneus; also mentionen them tims, & saith it was sent him under the name of Cardaus Arabicus. Although the Cardaus Episcephalus rejuits scalin was stath it was sent him under the name of Cardaus Arabicus. Although the Cardaus Eriscephalus seriosus be with most herbarists now a dayes called Corona fravra that it doth somewhat resemble the baldor home head of a Fryer, yet this is not that Thistle which Bartholomeus urbe venetams and Angelus Palas Fravisas Fryers say they saw growing in the confines of Aragen neare Castile, which while they were digging up demanded of a countrey man there passing by them is he knew the name thereof, who answered they called it vulgarly, it bore divers heads of Thistles set close one unto another without any stake under them, whereofthe middle herd several head of the rest to the number of eight or ten or more or lesse smaller and the rest to the number of eight or ten or more or lesse smaller ones standing round shouring the bignesses of a Wallout or greater: which name say they may not inconveniently be given to it, in that the middle head seemeth as a father and the smaller as his children, that so as brethren they doe compasse their in their their in scholars,

The Vertue:

I finde nothing recorded by any that have written of these Thislies that they are applied to any Physical are neither have I any thing to declare of them by particular experience.

CHAP: X

Acanthium & Carduns Tomentofus. The Woolly or Cotton Thille.

Here be divers forts of woolly Thistles, although there bee but one or two that can fitly bee referred to Acanthium Dioscoridis which is also woolly, I have therefore put the other hereunto in one Chapter.

1. Acanthium vulgare. The common Cotton Thistle.

The common Cotton Thisse hath many large leaves lying on the ground, somewhat cut in, and as it recompled on the edges, of a greene colour on the upper side but covered over with a long hairy wooll or property. Downe, and not much more white or hoary underneath, set with most sharpe and cruell prickes, from the side of whose heads of slowers thrust forth many purplish crimson threads, and sometimes white, but wondered the seed that followeth in these heads lying in a great deale of sine white Downe is somewhat large, long and round, resembling the seede of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the state of the seed of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the state of the seed of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the state of the seed of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the seed of the seed of the seed of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the seed of the seed of the seed of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the seed of the seed of the seed of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the seed of the seed of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the seed of the seed of Sylbiam or Ladies Thisse, but somewhat paler: the roote in the seed of the seed of Sylbiam or Ladies Thisse, and seed the seed of Sylbiam or Ladies Thisse, and seed the seed of Sylbiam or Ladies Thisse, and seed the seed of Sylbiam or Ladies Thisse, and seed the seed of Sylbiam or Ladies Thisse, and seed the seed of Sylbiam or Ladies Thisse Sylbiam or Ladies Thisse, and seed the seed of Sylbiam or Ladies Thisse Sylbiam or Ladies This Sylbiam or Ladies Thisse Sylbiam or Ladies This Sylbiam or Ladies T

2. Manthium Illyricum. The greatest Cotton Thisse.

Thisgeat Cotton Thisself (remembred by Lobel and Pena in their Adversaria that Valerandus Donres of Lile in Flains, brought out of Sciavomy and sowed at Lyons in France) groweth to be two or three cubits higher then ayon, almost to the height of a Speare or Pike branched forth on all sides, set with a prickly filme all abilities from to the other, and with large and long torne leaves fully fraught and armed with as cruell pickes and prickly large heads with purple slowers and seede like the former.

3. Cardum tomentofus Anglicus. Our English woolly Thiftle.

This woolly Thiftle hath divere large and long leaves all covered over with a wooll or downe, cut in very screen on the deges at certaine distances into severall parts or leaves even to the middle ribbe almost, making ablasse seemed with finall and long leaves on each side, and set in divers places with long sharpe pikks: the woolly stalke riseth up to the height of two or three cubits, with sew leaves set thereon, and with but whenches, bearing at their toppes a large round hoary head somewhat flat, covered over as it were with sew woolly stalke unto a net, not very prickly, with many purplish threads in the middle like unto rhose of the Artichoke, after which succeede Thisseles seeds, greater and rounder then those of the first the root is get and thicke, brownish on the outside and white within, not unpleasant to the taste.

A. Cardum tomentofus minuon. The lesser woolly Thisse.

This less woolly Thisseles was many whitish woolly or hoary long leaves, much cut in on the edges into many

This lifer woolly This hath many whitish woolly or hoary long leaves, much cut in on the edges into many part, and each part also divided and set with small prickes: the stalke is not very great, nor much above two some high branched towards the toppe, white and woolly also, bearing on them small prickly roundish heads bring many purple threads rising out of the middle, and small This leade after them.

I. Acanthium vulgare.
The common Cotton Thiftle.

5. Carduns tomentofus capitulis minime aculeatis five Areophylles Dalechampy Lugdunenfi. The fine Cottony Thisle without prickly heads.

The fine Cottony I mitte without pickly leads.

This fine Cotton Thiltle hath long and somewhat narrow whitish or hoary leaves, larger at the lower end of the small stalke, which is about a foote high then they are above, somewhat cut in on the edges, but much & thick set with small short and soft prickes in some places: from the middle of the stalke up to the toppe at every lease commeth forth a small whitish scaly head somewhat rough, but not prickly, and at the toppe likewise three or soure such like heads, out of which rise purplish slowers made of threads as in other Thisses wheremato the seed is like also. I doe thinke this doth rather resemble a lacea then a Carduns but that I have not seene the plant, and therefore doe follow mine author.

6. Carduus tomentofius capitulis spinosis sive Leucacantha Monspeliensium, The French supposed white Thistle.

This supposed Lencacantha of the Mompelier Herbarists, sendeth forth from a thicke sappie roote meanely set with fibres, many stalkes about a cubit high, branched from the middle upwards, set with many long hoary or woolly leaves, much cut in or torne on the edges, and armed with divers sharpe prickes the heads that grow at the toppes are small, somewhat long and prickly, sending forth many bright red purplish threads from the middle, after which come the seede which are somewhat long and round like unto the other Thisses seedes.

The Place.

The first groweth on divers ditches, bankes and in the Corne fields and high wayes generally every where throughout the

Land, it is also often found growing in Gardens: the second as is said was brought out of Illyria: thethird groweth in divers barren fields in Sommersessinere as Lobel noteth ir, and in divers other places: the south Dodenaus said he onely saw in some Gardens in the Low Countries, and Mattholius saith it was sent him by said the fift groweth in France in dry and sandy grounds, the last about Mompelier where some young stadens tooke it to be Leucacantha of Dioscovides.

The Time.

They all flower and beare their feede about the end of Sommer, when other Thiftles doe flower and feede.

The Names.

The first is taken by most of our moderne writers to be A'zis 2000 Acanthium of Dissorides which name the Litines keepe also, no other being found that better agreeth thereunto, as Matshiolus, Dodoneus, Duranes, Caminarius, Lobel, Tabermontanus and Lugduneus doe all agree, yet Tragus taketh it to be the Achamba lene Spina alba of Dissorides, and Fuchsius calleth it Spina alba fylvestris, Anguilara and Gesser in boris Ovoprdus Alam, as also Onogyros Nicandri, Cesalpinus calleth it Carduns splvestris, and Lugduneus phis sigure maketh it to Estybum sive Leucacantha Loniceri, and Bambinus Spina alba tomentosa latifolia spivestris, the second is the Acanbinus Illyricum of Lobel, & peradventure may be the Acanos Belloni, Bambinus doth certainely set it downe sor the Ompordon of Dodoneus, Camerarius and Lugduneus, and as certainly for the third Onopynus Dalechampi of Lugduneus, and faith also it is the Carduns viarum of Gerard and others, in all which I am persuaded he is much milatens for however the severall Thisses of these authors may be in some things like it, yet they are not idem them. Of the third, Lobel sirst made mention in his Adversaria, and called it Carduns tomenossus. Bambinus toother, eth whether it be the Spina Arabica of Anguistra, but saith it is the Spina Arabica Dissorbing & Pliny of Marthiolus in his last corrected edition, as also Spina Arabica of Cesses, and he himselfee calleth it Carduns tomenosis capitulous minore: the sit is called by Lugduneus & Carduns tomenosis to the Spina alba of Matthiolus and Lugduneus and others, to the Spina alba altera of Matthiolus and Cessimus Eaubinus calleth it Carduns tomenosis capitulous minore: the sit is called by Lugduneus of Matthiolus and Cesses.

Bambinus calleth it Carduns tomenosis capitulous minore: the sit is called by Lugduneus of Matthiolus and Cesses in the last in the Leucantha Minspinachum Talechampiy as Lugduneus tomenosis capitulous minore: the sit is the last in the Leucantha Minspinachum Talechampiy as Lugduneus tomenosis capitulous minore

Dioscorides and Pliny in the same manner write, that the leaves and rootes of Acaustinus the common Comman. This taken in di inke, doth helpe those that have a cricke in their necke, whereby they cannot must the suite but the whole body must turne likewise. Galen saith that the roote and leaves hereof are of an hearing entities, and good for such persons that have their bodies drawen together by some Spaline or Commisse, or bytes other infirmitie, which disease is truely to be called the Rickets, which happening sometimes to thild the bids them in their Nerves, Ligaments and whole structure of their body, that is suffered in missing to good prosper eyther in height strength or alacritic.

3. Cardens: tomentofn Anglism.
Our English woolly Thelic.
C H

Cardsi quidam sylvestres spinosissimi. Certaine very prickly wilde Thistles.

Here are some other wilde Thisse that are very prickly, to be intreated of, which have not yet been mentioned, which I thinke six to place together in a Chapter, which are as followeth.

This common Thiftle hath divers long leaves lying compafe-wife on the ground, very hairy all over, opecially while they are young, of a deepe or fad greene colour, long, and somewhat narrow, reat and epecially while they are young, of a deepe or fad greene colour, long, and somewhat narrow, reat and epecially while they are young, of a deepe or fad greene colour, long, and somewhat narrow, reat and see edges, and fet with many very sharpe prickly stalkes armed from which happe prickly silmes, branching forth in divers places, and set with the like leaves up to the tops, say they are the stalkes armed divers heads exceedingly stored with sharp pricks on all sides; from out of the middle thrust forth manifold divers heads, of an excellent lively colour, after which come somewhat small seede like unto other Thisses who were the toose is blackish, hard, and woody, where the stalke riseth and perishing every yeare after

This the common Thiftle differeth from the former, in that the leaves hereof are longer, narrower, more shiderent on the edges and not hayrie, but smooth all the lease over; in the flowers which are purple and shiften the seede and roots, and in the prickles like a Thistle; it different little or nothing.

2. Onopyeus param aculeatus. The gentler way Thisse, in the period of nording.

The gentler way Thisse, the first and are but smally set with the heads which grow many together, and are but smally set with the deads which grow many together, and are but smally set with short prickles:

the ground and a little prickly, but not filmed as the other, the slowers are purple like others.

The Affect of the state of the

Lalyacauthos. The most prickly Thistle.
This most pickly Thistle is as it were composed whelly spikles, for the leaves are short and narrow, so thicke ston both sides with small sharpe prickes, that they rake sayall she of sleaves; the stalkes also and branches are spentially slored with sharpe prickes up to the toppes, the solving else is to be seene; the heads also are in the sharper microstices for which rise pure still thready, as in other Thistles.

b. Cardous Polycephales. The many headed Thiftle.
The falke of this Thiftle hatt neither filme nor pricke throulike the late, but branched forth into divers parts, as they again parted into other finaller branches, on which fand many heads and finaller ones under them, with formfull prickes about them, out of which rife purplifful form of hort threads, as in others, the leaves are but few its falkes being flort and narrow, but as thicke fet with prickes as the last almost: the roote is hard and

7. Drypis Theophrafti Anguila: a.

Asguilar a his launcing Thiffle of Theophraftus.

The launcy of this Thiffle feeme to be composed onely of long same thornes, like unto Puniper leaves, many set to the comboth sides of the middle ribbe in turts at certaine acceptable of the middle ribbe in turts at certaine acceptable of the toppes of the stakes are said were, with bunches or turts of such long leaves like anceout of which come many small white flowers, combined of small leaves, and not of threads, like other lasts the feede lying in the downe of the heads is small award with a brownish barke, very like unto Rice in the lasts has when the buske is taken away, it is a very yellow, the same with a brownish barke, wery like unto Rice in the lasts has when the buske is taken away, it is a very yellow, the same with a brown the Corne flower seeds of the roote that the contemps of the corne flower seeds of the roote

8. Dryps querandam Lugdanenfi.
Another Dryps or lanseing Thirde.
This lancing Thirder itest up with divers ilender stalkes language to a mans beight, whose long leaves and narest analysis of many parts, smally cut in or divided.

2. Onopyxus alter augustifelim. Another wilde way Thittle.

4. Oneporden.
The Affes cracking Thiftle.

7. Drypis Theophrafti Anguillare.
Anguillare his thorny Thistic of Theoprafts.

S. Polyacanthos. The most prickly Thisle.

Cardina Lanceatus latifolius. The greater broad speare Thiftle.

The Theater of Plants.

Carden Lancation latifoling for mojor. The greater broad freare Thiftle. The leaves peare a name is armed with prickles like many other wilde Thifles, and the leaves fer thereon in or divided on the edges in two or three places, fer at diffances one against another, and the gratines five or fixe points or corners, sharpely armed, the end being long and narrow, pointed like and partines of pike; whereof it tooks the name, the flowers are purplish in fealy and prickly heads.

The narrow speare Thifle is like unso the last in the skinny prickly stakes, being strong and standing upright the last high, shored with few leaves, but jagged, prickly, and partower than the last, yet the end is some what the last, of a darke greene colour on the upperfide, and hoary gray underneash, she head are

which has flored with few leaves, but jagged, prickly, and infrower than the last, yet the end is somewhat the other, of a darke greene colour on the upperfide, and hoary gray underneath, the heads are many bush the other, of a darke greene colour on the upperfide, and hoary gray underneath, the heads are many bush as the other than the properties of the flatters as in other Thilles.

In Cardens Chondrilloider, The jagged Succeyy-like leaves,

The leaves of this Enistle are long and very much jagged very like unto the jagged, Gumme-sampleres, and prickly at the conners, the stake right hip a foote high, with such leaves on them up the tops, but shorter, blooder and lesse sagged, where it brancheth forth in two or three parts, each bearing the state of the parts, lead bearing the state of the past of the parts. The sagged where it brancheth forth in two or three parts, each bearing the state of the past of the past of the past of the sagged that the same than the past of the same which past of the same which gray the same that same the same than the same that same the same than and the first which palling away the huske-containeth within it much downe, wherein the small seede lieth, all small days, with the winde: the roote is white, long, slender, and wooddy, set with some fibres, and

13. Cardinus paluffris. The Marth Thille,
The Marth Thille hash a prickly round stalke, two or three cubits high, with some branches towards the in main times and narrow darke greene leaves, somewhat jagged about the edges, with a few prickes on two first the edges of the state and branches stand many Thisselfile heads with purple threads, as in other

Traffie first are found in divers places of our owne countrey, upon ditch bankes, about hedges and wayes files the fire groweth in the fields of Michelfield by Bafil : the leventh not farre from the fea, in the Martis mundry is the eight in corner fieldes, as well of oates as other graine : the ninth, tenth, and twelth, neere File and High lifeld marthes about Bafil: the eleventh in craggy and ftony places about Lyons in France. The Time.

They doe all flower and seede much about the time that other Thistles doe. The Names.

Oininin in Greeke, and Onopyxus in Latine quasi afinius buxus, and to Gaza rendereth it out of Theophrasius Oinche in Greeke, and Onopyeus in Latine quafi afinius bueus, and so Gaza rendereth it out of Theophrafus; and in finite it in the graiffinus. Of funnopers experience, yet some thinks it should be rather visuification quad ad sum platem afinis perpetus of figures of herest O'stopolo Onopordon; the signification thereof is rendred by Pliny, and tenderint afini creptum redders document, which Greeke name, saith Dalashampine; they about Paris keepe whistly, calling the said thisself Per dasne, all thereabouts constantly affirming, that when Assess there any will be more subject to cracking, and breaking winds backwaeds, than at other times which they doe while either and Dryph and rid by Value diffuse pureur a functionado, and scalin sin assistant and manager of colligere white where Dryph and rid by Value diffuse pureur a functionado and sense of the capita, of the many heads, as the other of the many thomas or prickles; the derivations and submands of the capita, of the many heads, as the other of the many thornes or prickles; the derivations and submands of the capita, as other than the comprasse is called Cardona selves for by Dodoness and Cardona affinitually Cesters in horse. manded the felt are calle enough to be understood. The names is a likewise are induced from so other Au-bit all them only the One provide is called Cardons followfire by Dodoness and Cardons spinions by Gefore is aboresis, at the Polycember Theoproafs of Lingdones fir and Tabermontanney, is by Reeliss called Agriculture, by Lobel Colony fine fillming & One person by Gerard, and the Cordons Chondrilloides, doth in my opinion betief resemble a librarium or Chondrilla than a Cardons.

The district properties attributed to any of these Thistles, are to the most common way Thistles that are not and distributed to any of these thickers and drunke, are good to expell thinking utrine, and to much the ranke smell of the armeholes and whole body, as also good against a kinking breats, hit the jayee and the ranke smell of the armeholes and whole body, as also good against a kinking breats, hit the jayee arm of the place are the place of the pla hipeth to bring it againg.

CHAP. XII.

Dipfacus five Cardum fullenum. The Teafell or Fullers Thiftle.

the Teafell there are two kindes, the tame or manured and the wilde: of the same or manured there is no varietie or differing fort, but of the wilde there are two or three forts, as shall be shewed in this Chapter.

I. Disfaces fasions. The garden or manured Teafell,
The manured Teafell hath the lower leaves for the first years very large and long, fashioned tennes Letice, of a pale greene colour, more gentle or not so hard; as those that are set on the stalkes, and shout the edges, and the middle ribbe on the backe or underfide, feevery thicke with thort prickles, which rice up the falkes, three or four foote high, armed from the borrome to the toppe, with hard fhore the prickles joyated in leverall laces, and two fuch leaves for thereat, both of them to joyated rogether at Pppp 2

CHAP. 13.

the bottome, and so compassing the stalke about that they doe containe the raine and dew that falleth, and are forme-what harder and fiffer and more prickly then, the lower a from between the leaves and the flalles on each fide rife. branches prickly also and joynted with the like compassing leaves, but leffer on them, and from their joynts, rife long tha kes bare of leaves but not of prickes, bearing on each of them a round head fomewhat long, armed with hite floor, and crooked prickles fashioned like hookes bending downwards, greene at the first and white being ripe, from a bout which come forth whitish hooded flowers appearing in circles flowring by degrees for the most part organing in the middle and to downewards and upwards, in the second verall cells whereof which conteined the flowers grow finall and whitish round seede somewhat long, the middle part of the head being often hollow, and conteining fometimes finall whitish wormes like unto Magots: the roote is white long and tomewhat great at the head with divers long strings and small fibres fer thereat and dyeth every

yeare after the heads be ripe.

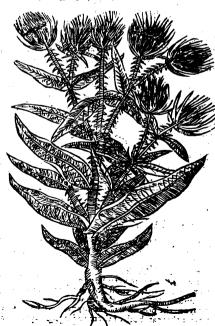

2. Diplacus / ylvestris. The wilde Teafell.

The wilde Teatell is in all things like unto the manured faving in the heads, whose prickles are small foft and upright not hooked or stiffe (which is contrary to the nature or all other wild plants almost, which are harsher and more prickly hen the manured) and in the flowers which are of a fine bluth or pale carnation colour.

3. Dipsacus sylvestris laciniatis folis. Wilde Teafell with jagged leaves.

This wilde Teafell (whereof I have no knowledge and but follow mine author, whom I will not to farre mistrust as to fay there is none fuch, for who knoweth all the diverfities that other countries doe-produce) is in all other things like the last taving in the leaves which are not whole and onely dented about the edges but torne in on both fides into deepe gashes.

2. Dipfteus fylveftets. The wilde Teafell.

4. Vuge post or it. The Shepherds fine.

4. Virga passiris. The Shepherds staffe.

14 Shepherds staffe is a kinde of Teasell also, but different therefrom in many notable parts, for the leaves the large are of a sadder greene colour, and not so prickly on the backe ribbe, but finely dented about the large grow higher and not so prickly, yet having some thereon, and leaves set by couples at the competing the fielke to hold water in manner like the former: the feverall branches beare small that the first had been been beare small branches beare finall that had been been with for prickles thereon and bluth flowers like the wilde Teafell.

trush in the flowers.

Cardinus fellatus latifolius;

The broade leafed Starre Thiftle-This Thille hath broader and shorter leaves than the former, but not much or to deepely cut in on the edges, with a few prickes fet here and there at the corners; the the is but little divided, having few branches fet with blickers, and at the toppes (mall round thicke white thicke with prices, for thicke with prices, for thicke with prices, the same for t white of a Starre, leven for the most part fer sprea-minercy place, the longest of shorts being, middle-shoot the other own cachinde, being shorter; out of the while of the head rife reddish purple threads like unto

men one Thifles; the roote is small and amount his Missonmer Thille or S. Barnables Thilles with the small and amount his Missonmer Thille or S. Barnables Thilles with the small and leaves lying next so the ground, deepely car many things and the small a The interest of Delmans, as her faith harb long leaves his Malendar to the ground, decepty out in on the chiming of Delmans, as her faith harb long leaves lying next to the ground, decepty out in on the plantage of Delmans, as her faith harb long leaves lying next to the ground, decepty out in on the plantage of the ground, and along point, of a leave and part of the ground state of in any of the other, and are fo cruelly sharpe that they pricke the Thighes and Legger share the passe thereby, in the middle whereof shand a few yellow threads; the seede is white and legger of made those of the former starte Thille: the soote is blackills, long, and sleader not growing deepe, joyand the indiverse places somewhat wooddy and bitter in taste, somewhat like unto the long Ciperus grafe now. Leaves the south in the long Ciperus grafe now. Leaves the south in the long Ciperus grafe now. Leaves the south in the long ciperus grafe now. Leaves the south in the long ciperus grafe now. Leaves the south in the long ciperus grafe now. Leaves the south in the long ciperus grafe now. Leaves the south in the long ciperus grafe now. giveth a figure hereof whose lower leaves and little jagged as the upper, which I have here see is to be read the difference.

The first groweth in the fields about London in many places as at Mile-end greene, in Finding field bould Milles, and in many other places that with white flowers is much more rare and not to be met with in an compasse: the third is found about Narbone in France, and the last about Mompelier in good plants he is be found wilde with us.

The Time.

The first flowreth early and seedeth in Inly and sometimes in August : the last is usually in flower and Midfommer or a little after.

The Names.

It is very probable that the Cardam Stellatm or Stellarm is the putager of Physical which is Asparagm petrum of Play which is formed of short of who also call it Carduns Solfitialis, Lugdunensis Leucacausha quorundam, who as Lobel also suith the Fried of it Aurioles in divers places, Casalpinus Caleatropola altera, and Columna Spina Solfitial Spinition Apala son Cada ftellatus minor, and Baubinne Cardous stellatus latens foliss crams, Gerard his figure thereof is not right, for it is had the first Cardous stellatus which Mr. Iohnson hath noted, yet giveth a figure for Solfisiatis little or nothing differing from the Stellatus, when as this true figure hereof is extant in Lobel, and whereas Gerard his Solfindia latea peregrina is supposed to be Acauthium peregrinum of Tabermontanus, which Banhinus knew not what to make of ; it is plaine by Gorards owne words that hee ment it by Clufius his Jacea Intea capitally himfu; many feet faults have passed Mt. Ishusons correction, which I am both in every place to exhibit, knowing that note due at can publish any thing but there may bee slippes and errors in many places therebs. The Italian call the Same Thittle (as I sayd before) Calcutrepels, the French Chauses of the Germans Wallendiffels, the Dutch Stored fel, the other we call in English S. Barnabies Thiftle or Midfommer Thiftle : > The Vertues.

The feede of the Starre Thiftle made into powder and drunke in wine doth provoke Vrine and belights breake the stone and drive it forths the roote in powder given in wine is good against the Plague or Pelline. by drinking thereof daily fasting for some time together is very profitable for a Fishina in any partothe bury.

They about Francke for doe use the rootes highest in stead of Eryminan which groweth there together with it as Camerariur saith. Baprista Sayahi doth much commend the distilled water hereof being dranks to help the French discase, and to open the obstructions of the Liver, and clense the blood from corrupted humors and is also profitably given against eyther quantum of servian Agues: The Midsonmer Thistic is used by the Savyar as Cameraring faith, and both flowers and toose admirably commended against the evill disposition of the whole body called Cachavia, against the Dropsie daily Agues, maideas pale colour by reason of the green fiducit, or other obstructions, the countrey people faith her doth much use the distilled water or the decodion hereof both against the swellings of the speece and prickings in the sides, as also to provoke sweating and to helps the hip. goute or paines in the huckle bones called the Sciatica.

Carduns mblin. The gentle Thillie.

Ne of these kinds of gentle Thisles I have published in my former booke and therefore shall not neede to speake agains thereof in this place, but of the rest as they follow.

1. Cardina mollie laciniato folio. The gentle Thiftle with jagged leaves

This jagged gentleman hath many leaves, forme lying on the ground, others flanding more upight much jagged or cut in on the edges, even to the middle ribbe, greene on the upper fide, hony which and woolly underneath like unto the younger and fofter leaves of the first state. This is not having my few of prickles on them, of a little drying and bitter taste a from smoon which rise up one or two round things about two foote high, of a reddish colour yet covered with a fine Downe or Cotton, fet with diven known the whereof are like those on the ground but smaller, and those up higher are narrow and long without diversity the ends and points of them being usuallist, and those up higher are narrow and long without diversity the ends and points of them being usuallist additional the contract of the faith which is more usuallist. vision, the ends and points of them being usually reddistry at the topic of the failte which is store with very lost and gentle with very lost and g

themous of the mipdle whereof rifeth a reddifh or stammell flower made of divers fort and woolly threads: defende that followeth is great and somewhat cornered: the roote is somewhat long and of the bignesse of ones in the bound of the bignesse of ones in the bignesse of the b

2. Cardous mollis angustifolius. Narrow leafed gentle Thisties This other Thiffle hath shorter stalkes and narrower leaves then that fort I have fet forth in my other booke, must be and heary underdeath, having a few fost prickles about the edges, at the toppes of the stalke stanshort fally head greater then any of the other, from the middle whereof commeth many fine blewish purple threadlike wooll of the faid colour.

3. Gardium wollis Heleny folio Camerary. Camerarius himgentle Thiftle. 3. Caranta mons recently one camerary. Camerary in magnetic 1 mail.

This Thille groweth very tail having large leaves next the ground, very like another on the stakes are like the sate groweth very tail having large leaves next the ground, very like another on the stakes are like the state ground on the stakes are like the state state on the stakes are like the state state on the state on the edges, the toppe whereof is sumithed with small scale beads upon short stable by the state of the stat bothike, with reddificereds for the flower in the middle : the roote is blackift and spreadeth it felte, encreaing by new thootes from it.

4. Garduns matthe latifolius Lappa capitulio. The Burrelmaded Thiftle, The falke hereof is above a cubit high fet with divers foft and short prickles, with divers long and broad leaves fittent locke leaves, being smooth thinne and full of veines, and with a thew of tome small prickles about therden, at the toppes of the stalkestand divers small prickly heads like unto Busses, both for the forme and beath, or of which flare reddiff flammel | coloured threads which are the flower, The Place.

Theful Clufus faith he found on all the hills that runne from Callenberg unto the Alpes and in other places in hayer; the second on the bill Smallen : the third Camerarius faith is frequent on all the hills of the Hermoduri : mi Banbinus faith the last was found on the hill Taurerus in Austria. The Time.

They dee all flower in Inly and August.

The Names. The plant as Clufus faith are not firly termed Thiftles wanting prickles, but might more july bee referred The long capitule from the part of the par The motion them as they thought most fitting to their naturall forence. Classics calleth the first Cardaus mollis apparation, and Bankings Cardaus mollis lacinizate folio: the second Clussics calleth Cardaus mollis apparations velous, and Bankings Cardaus mollis folio belongo Ciriy capitale: the third Camerarias calleth Cardaus mollis folio belong Ciriy capitale: the third Camerarias calleth Cardaus mollis folio belong ciriy capitale: the third Camerarias calleth Cardaus mollis folio belong the William um finosus, Claffascalleth it Carduns mollis Camerary, and Banbinus Carduns mollis folio belong : the Banbinus letteth forth by the name of Carduns mollis latifolius Lappe capitulis.

The Vertues.

We have not knowne or heard unto what difease any of these plants have beene applyed, and distinct we have forewhat worthy the relation we must be filent, leaving them to every ones judgement to apply the according to discretion.

CHAP. XVI.

Acanthus Que Branca urfina. Beares-breech?

Here are two forts of this herbe, the one smooth and without prickles eyther on the leafeor head the cther very prickly in the leafe but not on the head: which although I have fet forth in my former booke, yet I thinke good to repeate them here againe, in that I would a little more comment upon

them, and thew you more fully their specificall vertues.

1. Acanthus fativus. The garden gentle or manured Beares-breech.

This gentle Thistle (as it is accounted) shootest foote many very large thicke smooth and sad green leave upon the ground with a thicke middle rib, and parted into sundry deepe gashes on the edges, from among which after it hath stood long in a convenient place, rifeth a reasonable great stalk 3 or 4 foot high without eithright. branch or leafe thereon, but onely from the middle upwards, fee with a spike as it were of white booded or gaping flowers standing in brownish huskes, somewhat sharpe at the points, and a small long undivided leaform der each flower: after which come in the hotter countries (but not in ours as far as I can learne) broad flat round thicke, brownish yellow seede; the text of Dioscorides hath them somewhat long but such did I heart seemich having put into the ground hath sprunge with me and growne, the rootes are many great thicke and loghing forcading farre and deepe in the ground, of a darkish colour on the outside and whitish within, very damny and more then the leaves, so full of life that a small peece left in the ground, will spring up againe, but will require thelter or defence from the extremetic of the winter wether.

2. Acanthus Sylvestrie. The wilde or prickly Beares-breech. This other wilde or prickly fort hath likewife fundry long leaves, lying on the ground but much mrower more devided on the edges into smaller parts, and each part with small incidens, and very sharpe white pickles at them, from among which a leffer and lower stalke ariseth, with the like spiked head of flowers, and a few trikes ar them, from among which a little read to the first state of the firs deth not so deepe, or farre as the former, nor groweth so great but is more tender to keepe from the Win-

The Place and Time.

They both grow naturally in many places of Italy, Spaine, and France, but are onely nursed up in the car

The circles with us: the first flowring in Iune fometimes or in Iuly but giveth no perfect feede with us, the data bandowreth and seldome or never yet gave us any shew of ripe feede. 111BE 9.

The se called in Greeke augr 3 and augr 3a, Acanthus, and Acantha and is relieved Herpacantha by fome, and They we cancer in Change and making with Pederor and Melamphylles as Oribafins and Pliny have it, Fuchfine also pelmoth for mility and making and elementary allows as the period of the state of the st desmonth for warmer with the Marmoraria by the Romanes which is corruptly turned into Mamelaria among which is cornerly turned into Mamotaria among shall make of Dioforides, became the forme of the leaves was usually the patterne for many engravings, schillard names on Deposition of the real course of the real course was unually the patterne for many engravings, scin pillars and other workes, their pots and cups also flewred with the same: The first is called Acanthus verus ac in pillar and other words by all others, or molis Vergilis, and Branca arfind by the Italians: there are fome that the substitute of the feedes as you have all other this be the true Acanthus of Dioferrides partly for the difference of the feedes as you have and partly of the colour of the rootes to be red, but all other parts fo exactly agreeing thereunto bath iders, and party of the against make a question as Bambinus miltaking the matter, whether the garden kinde but the desired of Theophy of su lit . 4.c. 11. Which he putterh among the herbes: but he in disjoyning Acantha hearthe account of the comparing of the comparing to the comparing to the comparing to make them two things alcreeth the fame wonderfully, as you may fee it in Baubinus his Pinake his Sulpupon Acanthus, and comparing it with Theophraftus his Text: but I thinke I may more truly wonis semy upon a sanhus thould bee numbred inter Spinas & Cardnos, being fo smooth an herbe without any to unjustifies or thornes in leaste or heads; which if I might give an answer thereunto, might rather proceede is we prefete or thomes in lease or heads; which if I might give an answer thereunto, in ight rather proceede from the fifth of the thyrs or spike of flowers unto the wilde or prickly fort then of it selfer; the other was sometime for the thyr of the thyr of the content of the selfer of the third of the selfer of the selfe The Vertues.

Breaken of the mucciliagines in the leaves they are often used in our times in the decoctions for glisters, so to methepallages more easte and flipperie: but Dioscorides faith that they binde the belly, and are good for those members that are out of sjoynt to confirme and strengthen them which no doubt it may doe by the slimy matter in the leaves and rootes, and foone convertible by heare into a binding quality; for as Galen faith 6, fimpl, the routhithadrying as well as a gentle cutting facultie, being of thinne parts and the leaves often meanely digefing with all the rootes fay Diofeorides and Pliny are applyed to helpe those places that are burne with fire, and alo mothet are burften, Crampes likewise and the paines of the Goute, to be outwardly applyed, and the deroction of them taken in wasdly provoketh urine, and is good for those that are falling into a Consumption.

CHAP. XVII.

Anonis five Resta bovis. Rest Harrow or Cammaok.

Rer I have shewed you all the Thisses that are usually knowne, let me to finish this Classis include whose the hole should be so bushes that are thorny and prickly, some of which number are already entreated of in my former booke, and those are the Roses of all sorts for a Garden, the Raspis berries, the Gooleberries and Barberries, the Paliuras or Christs Thorne, the Pyracantha or overgreene Hawtherne and Savine of the Figure 1 Indian Fig., and the Indian Incea which hath a Prickly pointed leafe; & in the second Classification worke the purging Rhamnus or Buckes thorne : of the rest I shall speak here in order as they come multipliand, and first of the Rest Harrow which is distinguished into two kinds, the one thorny, the other genthe without thornes which is to be joyned to the other for the names fake, of each whereof there is some varietie wite facceeding Chapter will shew.

1. Anonis (pino (a flore purpureo, Common Rest Harrow with purplish flowers. The common Relt Harrow that is frequent as well in arable as waste grounds and by lanes, rifeth up with dirastough wooddy twigges, halfe a yard or a yard high, fet at the joynts without order, with little round fh kine some imes more then two or three at a place, of a darke greene colour, without thornes whiles they are man, but after wards armed in fundry places with short and sharpe thornes: the slowers come forth at the tops of the twigges and branches whereof it is full, fashioned like Pease or Broome Blossomes, but lesser, states and lowwhat closer, of a faint purplish colour, after which succeede small pods conteining within them small farandramed feede: the roote is blackish on the outside and whitish within, very tough and hard to breake while it if the hard greene, and as hard as an horne when it is dryed, thrulling downe deepe into the ground, and writing likewife, every little peece being apt to grow agains if it be left in the ground.

This part was a little from all of the peece being apt to grow agains if it be left in the ground.

This Reft Harrow differeth in little elle from the former then in the leaves which are a little fresher greene, win the colour of the flowers which are very white in some places more then in others, in other things they

3. Anonin spinosa mentana lutea major. The great yellow prickly Rest Harrow. This like the different from the former onely in the leaves which are fomewhat larger and longer and in the bwan which are yellow like the other yellow kinde without thornes.

4. Amonie Spinofa Intea minor. The leffer yellow prickly Reft Harrow. The other yellow Reft Harrow that hath thornes or prickes thereon is like the last yellow fort, but lower and

The Rell Harrow hath no other difference in it from the most common, but that this bath no thornes or prickes.

upon the sprigges, no not in Autume when the other will Flore albo. have very many. Of this fort there is one likewife that beareth white flowers which maketh all the difference.

6. Anonie non spinosa lutea major. The greater yellow gentle Rest Harrow.

This great yellow gentle Rest Harrow shooteth from the roote which is long rough and blackish, divers flexible wooddy twigges branching forth on all fides, covered with a brownish red barke fet reasonably thicke with leaves, which are for the most part three standing together upon a long footbalke somewhat like unto Trapile, but somewhat small narrow and long with notches at the ends so much overspread with a strong sented clamminesse that it will sticke so fast to their hands that touch them, especially in the heate of the yeare, and in the hot countries that it will hardly be taken off againe: at the toppes of the branches stand many Pease blossome-like slowers, of a faire Minor for yellow colour, after which come small & long cods with a Minor flo-tre adorato crooked point at the end of every one of them, where-the flow pur- in is conteined small flattish seed. Of this kind we have had from Boel of Lishbourne a lesser fort, whose flowers smele better then theformerathe roots of both are annuall perifhing yearely. As also another with a more reddish flower,

7. Anonis non spinos a tutea variegata. Variable yellow gentle Rest Harrow.

This different in no other thing from the laft yellow, but in the flowers which are of a paler yellow colour, ftriped all the length of the flowers with reddish stripes, which make them the more conspicuous and regarded.

8. Anonis viscosa miner luteo pendule. The leffer yellow gentle Rest Harrow.

This leffer yellow, gentle Rest Harrow groweth very low and small not much above an hand breadth high, having many branches of two or three inches long a peece. with leaves fet thereon, three joyned together for the most part and clammy also like the other yellow forts, the flowers stand in like manner at the toppes of the branches

Natrin Plinij live Anonis non fpinofa lutea major. The greater yellow gentle Rest Harrow.

TRIBE 9. roow hit smaller and hanging downewards: the seede that followeth is much like the other, but smaller and in improveds. Of this fort also wee have had from the said Boel two other forts with reddish flowers both of Minor implementations and small, the one being but annual and the other abiding indirects. Or this translation one being but annual and the other abiding.

peremit fecond and fift with the varietie thereof grow in many places of our Land, as well in the arable as flirabile. It has be shired and fourth I never mer with growing passessells and the state of The fift tecond and the whited and fourth I never met with growing naturally any where in on countrey, although in the gounds, but the third and fourth I never met with growing naturally any where in our countrey, although in the gounds, but the third arounds have used about Reidem as Toucher Country, and on the countrey, although wate grounds, our trie times are selected as well about Brifton as London, Gefner faith the third groweth on the The initial the routh that is growed as well and the fourth groweth in the kingdome of Naples : the fixt, feath the third state arouseth as well in Naphane in England. bill Grame among the reseptions, while countries taken the fourth groweth in the kingdome of Naples: the fixt, ferential eighth with their varieties groweth as well in Narbone in France, and about Mompelier as in Spaine and Particular.

They doe all flower about the beginning or middle of Inty, and their feede is ripe in August.

Dissimilar and Pliny call it A vorts Anonis, Theophrastus and Galen O'vorts Ononis the Latines keepe both names, Disconnes and I am a utilitatem prabeat, dici videtur, fiquidem aratoribus inimica eft, vivaxq; nimis guniquas non suvanus quou nocet nisse quas ex adverso nomen inditum putaverit : Ononis àπο το είνα quasi dicas asini founquais & sui aculem nocet nisse quasi dicas asini founquais o sui aculem con affirmant asinos in ea se volutare & dorsum sub ejus aculem libenter exterere. It Milliamen, same bovis and Refeabouis, and Remorum arairi, because the roots are both so tough that the Plough is all causes are south to tough that the Plough Shereamoreauty on them, and the first twitch, not being able without more then ordinary strength to indishible Oxen to bee at a stand for the first twitch, not being able without more then ordinary strength to indishible Oxen to be at a stand for the standard strength to indishible oxen to be a standard for the standard strength to indishible oxen to be a standard strength to be a standard for the standard strength to be a standar militentions, or an one that in the bring Ononis into a garden least it prove Anonis that is not helpefull but but but and not easietorid it out againe. Anguilara tooke it to be Egipyros Cratena. All writers else call it firm Aunit; Ononis or Restabovis with the severall distinctions of spinosa or non spinosa, and according to the charof the flowers onely the great yellow without thornes is taken of most herbarists to be Natrix "lim, which comortice nowers one by the great of faving, hee will neither guesse nor divine by what argument it is supposed, nor mobile him felfe much to disprove them, yet Anguilara doth rather thinke the Fraxinella should be it. The Ita-Bourcall it Anonide Bonaga and Resta bove, the Spaniards Gattilhos and Gattinos, the French Arreste beuf, the Grand Henbackelland Ocksenbreck, the Dutch Prangmortele, oft Stalcruyt, and wee in English Rest Harrow Tanjow Instrument and then Rest Plough or Rest Oxen as it is in other languages, in some countries also Cammock and Petty Whin. The Vertues.

Galarhith that the roote of Rest Harrow is hot in the third degree having some clensing and cutting facultie thermallo. It is fingular good to provoke urine when it is stopped, and to breake and drive forth the stone, which the powder of the barke of the roote caken in wine performeth effectually; for Matthiolus writeth that beken divers freed from those diseases that used the sayd powder in wine for many dayes together, and the fine allo to helpe that discase called Ramex or Heinna carnosa the fleshy rupture, that is, that fleshy carnositie by little and little confumed, in taking the faid powder for some moneths together constantly, when as the Physicions and Chingions had given them over, as desperate or no otherwise to bee cured but by cutting or burning: the decotion thereof made with some vinegar and gargled in the mouth easeth the paines of the toothach est establish when trommeth of rheume: some also affirme that the decoction hereof drunke doth helpe the painefull hemormodes: but it is certainly found true that the faid decoction taken is very effectuall to open the obstructions of the Liver and Spleene, and the other parts: a distilled water made in Balneo with four pounds of the rootes of RetHarrow, first fliced small, and afterwards steeped in a Gallon of Canary wine, is singular good likewise for all the purposes afore said, and to c'ente the passages of the urine, not suffering any matter that is clammy to gather mg ther or harden to become a stone: the faid quantitie of the rootes sliced and put into a stone pot close stopped with the like quantitie of wine, and fo fet to boyle in a Balneo Marie for 24. houres is as daintie a medicine for under floracks as any the daintiest Lady in the Land can defire to take, being troubled with any the aforesaid githts: the powder of the said roote made into an Electrary or Lozenges with Sugar, as also the barke of the inth roots boyled render and afterwards beaten into a Conserve with Sugar worketh to the like effect the powder of the roots flrowed upon the hard callous, brims of ulcers, or the faid powder mixed with any other convenient thing and applyed doth confume the hardneffe and canfe them to heale the better: it is recorded that informer times the young shoots and tender stalkes before they became prickly were picled up to bee eaten as a many fawse, wonderfully commended against a sinking breath, and to take away the smell of wine in them that had drunke too much, Pons in his Italian Baldus faith that divers Apothecaries with them there in Italy doe ultimbwers of the yellow Rest Harrow in stead of Melliloteyther through want or ignorance.

CHAP. XVIII:

Tragacantha. Goates Thorne.

Ginnot but diffent from Banhims who diffenteth from Cluster and others, that make Poterium another for lefter fort of Trague on the American from the Pimpinella spinosa; for I must doe contrary to him, and thinke I have good reason for it, as shall be shewed by and by, and speake of the Pimpinella spinosa in Chapter by it felfe, because I finde the difference betweene Poterium, Tragacantha and Pimpinella fine to confift in many things.

I. Tragacantha vera. The true Goats thorne. The true Goats thorne is a fmall bushie plant rising up with many tough plyant or flexible wooddy stemmes attenuch above a cubit or two foote high divided into many flender branches, covered with a white hoarinesse, the with divers long white thornes in a double row, among which rife up divers winged leaves that is, many

small long and round leaves set on each side of a middle ribbe, which abide on all the winter long and full next, untill the spring doe bring on sresh, and then fall away, at the toppes of the branches, and smong the long come forth the flowers which are of a whitish vellow colour, sashioned somewhat like unto the sown of a long, after which come small short upright white cods, wherein are conteined small whitish consent skin the roote is very great and long, spreading much and farre in the ground, which being broken or wounded the trough pure shining white gumme, in small crooked peeces talting somewhat sweete. There is another to the property the state of th

deth a rough pure ining winte gunnar, in man crooked peeces catting about the man month for hereof wholestakes and branches are blackish and wooddy, having small thinne, leaves all set on one side, and not opposite as in the former, the flowers and seede is somewhat like, but the roote yeeldeth no gunnar.

2. Tragacantha alterasen minor Poserion forte Diescoridis. The small Goates thome.

This other Goars thorne is fo like the first that it is often mistaken for it growing lower and smaller then the for mer, yet fpreading and shooting forth pliant flexible stalkes, covered as it were with stales about a fox high from whence springethup a cottony or woolly head, which breaketh into sundry winged leaves in the springer from whence springeriup a cottony or woonly near, which because into the search and almost round leaves being fer on both sides of a middle ribe, which are toy the years, made or many must and annot round forth, which the former hath not and so continue hoars alog as they abide on the ribbe, which proveth a thorne very cruell sharpe and prickly at the end when they area len away, forthat all the winter long no leafe is feene on any, and the thornes that have caft their leavagers have any more growing on them, but abide bare and naked thornes ever after, the buth feeming all the wing long nothing but long sharpe white thornes : from the upper parts of the stalkes come forth two or three winth flowers standing together, made of two leaves a peece an under and an upper, both formed somewhat the hoods, each flower in a hoary huske or hofe; the pod that followeth is hoary, white, thickey thort and fonewher broad, ending in a point wherein is contained whitish seede, somewhat like unto a Medica seede the rope is great long and tough, blackish on the outside and white within, some what sweet and gummy, setyedding but little gumme and that more yellowish. There is another fort hereof whose branches are very sharpe, not rifing much above the ground, but they are many and thicke growing together, the roote being women yeeldeth a gumme like unto Tragacantha.

Petc tam asud.

3. Tragacantha Syriaca flavescens. The yellow Syrian Goates thorne.

This Syrian thorne differeth very little from the last but in the flowers which are yellow, standing in regulation with huskes, and that the whole plant groweth lower.

4. Tragacantha Syriaca purpurafeers. Purple Syrian Goats a thorne.
This other Syrian kinde is as low as the last, having many browne thicke stalkes, thickeset with leaves unduring white heads at the toppes, out of which come purple flowers like the former which are very beautiful.

The Place.

Both the former forts with their varieties have beene found as well in Candy as about Marfelles and Marpelier: the first anciently knowne both there and in other places sufficient plentifully, but the other was also found by Clusium in the kingdom of Granado, a more exact figure whereof was sent unto him after his death from Aguaffextias which is not farre from Mompelier, and is published in his Care posteriors in quarte, pag. 113, the other two last sorts Rauvelsium, and Lugdunensis from him in his Appendix setteth forth to grow in Syria.

t. Tragacantha vera. The true Goates thorne.

2. Tragacantha altera feu minor Patrios forte Diafteria. Small Goates thorne.

The

al a:

All these forts are very tender to keepe with us, not enduring the cold of these cold climates without extraorating are and provision, but in their naturall places flower and seede in the beginning of Autumne.

The Names.

The full is undoubtedly knowne to be the Teapers von Tragacantha of the ancients, ideft, Hirei fina not from any The first is unaudated as the Tragium and Tragoriganum have, but from the flarpe forme of the bush with four first groweth representing a Goates beard, the gumme likewise that is gathered from the rootes when there out or broken in the heate of the yeare is called Gummi Tragacantha, and in the shoppes of Apothecaries before on Gundragant, the varietie thereof is mentioned by Alpinus in Libro de exercis plants: the second nalicating: Neurat quod nervia amica sit & Poterium quod potrix berba paludosum riguumque solum anunt, as some of Play faith it was called also Phrynium: this differeth from the Tragacantha but vet commeth nearer therein the primpinella spinosa as you shall heare in the next Chapter, the chiefest difference betweene the mountaine and Poterium, confifting in that it keepeth no greene leaves in winter as Tragacantha doth, is more Installment restriction to the first the first three t togerman increase and a dry iaplefle roote which yeeldeth no gumine, and abideth ever gente. Now let others judge whether this be more firly referred to Pimpinella spinola as Bunkinus or to Tragagrows town dothrwho calleth at Tragacantha altera forte Poterion, and so doc Lobel, Tabermo tanne. Albinus and Influence and Bellonium like wife as it is likely. Banking himselfe although he sever it from the Classis of an up may recalleth it Tragacantha affinis, Matthiolus calleth it Poterium and 10 doth Tabermontanus and Lug-roundshayet calleth it Tragacantha and Lugdonnenft in his Appendix in the like fort after him a the land, Rawolfius maketh it his first Tragacantha and Lugdonnenft in his Appendix in the like fort after him a the wolf for are fee downe by Ranwelfins in his fecond booke and in the laid Appendix of Lugannenfis. The Vertues.

Identifinde that the leaves flowers, seedes or rootes of Tragacantha are used toany purpose, but onely the not specified the physical uses ferveth to many purpo es as a kinde of starch or Glew to binds of fifth things with all; the gumme diffolved is often mixed with perforall Syrupes, hony or juice of Licoristo ble the cough or hoar senesse in the throate salt, and sharpe distillations of the ume upon the Lungs, being taken un Electrary or pur under the tongue fo to distill gently downe: the said gumme distilved in freet wine a dimustime and drunke, is availeable for the gnawing paines in the bowells and the flarpnesse and frettings of urine, other in the revnes or bladder, especially if some harts horne burnt and wast be mixed therewith: the faid gun alou an ocular medicine helping thereunto, being uted alone or mixed with other things for the purpofe an ally the heare and sharpenes of hot rheums falling into them, and strengtheneth and bindeth more then Sarcosolla. the faidguame mingled with milke taketh away white spots growing in the blacke of the eyes, the itching also of them and wheales and cabbes that grow upon the eyelids : being formewhat terrified and mixed with the juice or wincof Quinces and used in a glister is good against the bloody flux. And generally used where there is cause of making (mooth any of the le parts that is the Lungs, Cheft, Throate or Windepipe growen hoar le or sharpe by manes or to represse or dry up defluxions of sharpe and thinne matter to the throate, jawes,&c. as for Vicers interpositive parts it is an excellent and approved remedy : the rootes of the second which as I sayd is verily bid to be the true Poterium of Diescorides boyled in wine and drunke is profitable against the poyton of the red rode, andbeing made into a pultis and applyed to any of the Nerves or Sinewes that are wounded cut or hurawhitelethem and foder them together, as also all other forts of wounds and cuts : the faid decoction of the toxisin wine is also effectuall for the said purposes to bee drunke, and for inward wounds and veines that are

CHAP. XIX.

Pimpinella spinosa. Thorny Burnet.

and shall here more presently) spreadeth divers wooddy whitish twiggy stalkes round about, not rising much above a cubit high branching and interlasing it selfe one within another very much bearing sunch above a cubit high branching and interlasing it selfe one within another very much bearing sunch above a cubit high branching and interlasing it selfe one within another very much bearing sunch above as cubit high branching and interlasing it selfe one within another very much bearing are closed together, and afterwards spread themselves more largely and dented about the appearing are closed together, and afterwards spread themselves more largely and dented about the agree very like unto small Burnet leaves, greene on the upper side and hoary, white underneath, with many stall prices or thornes, not very strong or sharpe, set consuledly apon the stalks and at the ends, at the toppes where so the stand divers small Blackeberries, or Mulberries, greene at the first and reddish afterwards: the rote is not great but long and slender, spreading much under ground, being tough and not easie to breake, bridge or without any gum comming therefrom when it is broken.

The Place,

Thisgroweth in Candy as Honorius Bellus (aith and Alpinus also upon the hills where Time. Savory and Asparalargow, and with them having Dodder growing upon it also: and upon the side of mount Libanus in Syria as
largely saith, and as Dalechampius (aith in the vallies beneath the hilly woods in Savoy about Marra which is
little distant from Gratianople but is never found in wet or marshy places.

The Time.

I flowrethin the end of Summer, and the fruit is ripe in Autumne when the young leaves beginne to spring

The Names.

This plant is generally called Pisspinella spines, and by some as is aforesaid Poterium but fally for Poterium as you have heard before bath very strong and long white thornes, the leaves are like Lentills, the fruit are cods wherein we the feede and the roote veeldeth a kinde of gumme; all which are contrary herein as you may perceive by the description, the leaves hereof being dented about. and in shew very like Burnet which together with the prickes hath caused the name of thorny Burnet. Hone_ rius Bellus in his second Epistle unto Clasius sheweth very learnedly and by found and good reasons, that this plant being called rolling. Stabeda not onely in Candy but of the Greekes in generall (which name is but corrupted from Stabe) is the true Stabe of Dieserides although hee hath not given any description thereof (but differeth much from the Stabe of Galen) sirst because the names are fo like, then that the drying qualities herein are answerable to the Stake of Dioscorides : next bee sheweth that the Pileos of Theophraft in lib. 6. cap. 1. called also Stebe of fome as he, faith (and not Phleum which is a marfa or water plan, the affinitie of the names having deceived many learned men in taking them to be both one) is numbred by him among the thorny plants that have thornes beside the leaves as this Burnet hath (and not as Gaza translatethit, at the thorny leafe hath another leafe plaecd with it) comparing it therein unto Ononis and Tribulus; and that Stabe is a thorny plant, Plutarke in the life of Thefess sheweth, where saying, Ioxus the sonne of Menalippus taking care to plant a colony at Caria from whence the Ioxides had their originall, have this custome among them that they neither burne the thornes of Albaragus nor of Stabe but have them in reverence and honour : Ætins also in his third booke and 29. Chapter af-

firmeth that Epithymum (or rather Culenta) groweth upon
Stebe but whereas Theophraftus in his fixt book and third Chapter feemeth to make it peculiar to Phint Cappar and Tribulus, to have not onely a thorny stalke but a prickly lease also, hee differing herein much sombinklist for in the same booke and sitchapter hee saith, that Phiess and Hippophoes (which Gaza translated Lapses) have gentle leaves and not prickly as Interior Capparis hath: but Pliny in his 21, booke and 15, Chapter not rightly confidering what Theophrafiu had written of Stebe, hath not onely erred himselfe but hath better cause of many other mens errours. Now concerning Phleum that it is a plant farre differing from Stabe, and mekoned alwayes by the Greeke writers among the marsh plants and not among the thorny, these things may is ficiently induce. First Plutark in his second booke of naturall questions faith thus, Layen must know the all maish plants such as Tipha, Phleum and Ulna, doe neither spring nor grow if the raines fallingt in their proper sefon. Aristophanis also saith the same in his Comedy of Frogs, where the quire saith, we have beene slipping among the Cypirus and Phleum rejoycing in their songs: and Theophrastus lastly in his fourth booke and eleventh Chapter numbreth Phleum among the plants of the lake Orchomenius, and appointeth two kinds, the male that beareth fruit and the female that is barren ferving onely to binde things withall, and faith also that the fruit of this Phleum is called Anthella, whereof they use to make a lye, and is a certaine flat thing like a Cake soft undreddish, which plant is yet unknowne to the both herbarists of these times. Anguilara tooke this Pimpinlatobee Zanci G Chalceios five Araria Theophrasti, and Clusius doth fo entirle it alio, Ranwolfius faith that the Moores of the country about Libanus call it Bellan and laith it may well be the Sanguiforba pinofa of others: Clusimand Camerarises call it Pimpinella spinosa, and Baubinus Poterio assinis foliys Pimpinella spinosa, as though there were ano ther Pimpinella spinosa and that this had leaves but like unto it.

This is of a very drying and binding qualitie, and therefore is taken to stay laskes and stuxes of the body, the herbe being boyled and the decoction taken fasting, which Honorius Bellus saith that they of Candy due account to be a sure medicine to helpe them, when soever they neede for that gurpose.

CHAP. XX.

Aspalathme. Spalatos thorny Bush or Broome.

Information of two forts of Apalathus, the one reddifth or purplish under the upper back, the other white, both which are almost unknowne to the most judicious at these times, yet Pass in his Latine and Italian Baldus, hath expressed the figure of the sirch Apalathus, and in his Italian the signer at the sirch the second differing from those of Clusius and others, growing with Signer Contarini, all which Ithinke fit to show you here.

I. Aspalathus after Monspeliens. Dioscorida his second Aspalathus according to those of Monspelier. This Aspalathus or thorny bush of Monspelier (where the learned did judge to be the second Aspalathus of Contact.)

fordet) is a small dow bush or shrubbe, not rising much above a smitch short with divers branches and sharpe short or oked the shedding downewards set on them, as also many small some leaves, divers for together on both sides of the middle sides ob bigger then Loneill leaves, and such like wife the young stades have, but smaller: the flowers stand on the stronger handes have, but smaller: the flowers stand on the stronger handes have, but smaller: the flowers stand on the stronger handes have but smaller; there or some stronger stands of Broome slowers, sometimes more yellow and sortiums paler, after which come small seedes in small sod.

2. Aspalathus alter secundus Clusis. (Insim his other fort of Aspalathus.

This other Afpalathus of Clusius groweth greater higher and insect then the former, and fet with sharpe crooked thornes appendially as it, with small leaves on them in the same management to be sharped of a paler colour, in the rest there is little difference to be increased between them.

3. Aspalathus alter tertius hirfutus. Small Aspalathus with hairy leaves.

This small As polarisms groweth a smally lower then the first, as socceeding a foote in height furnished with more stender yet pickly stakes, but divided into many such smaller branches, but stry seems almost as small as those of Southern wood, begins and prickly; from the elder branches shoote forth in the Spring of the yeare other smaller stakes bearing many hoary kwellke those of Lentills but softer and larger then those of the sist for the slowers like wise being yellow like the other argument then they by a little: the seede like wise keepeth a proportion like unto the rest.

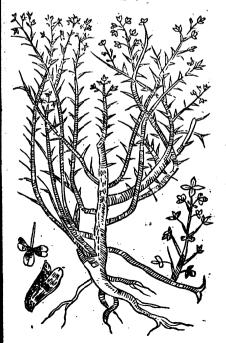

4. Afpalathus secundus Dioscoridis legitimus Pona.
Dissendes his true second fort of Aspalathus according to Pona.
The wie Aspalathus alter Dioscoridis stirt described by Honorim Beharos Candy in his first Epistle to Clussus and the figure thereof afterwards exhibited by Pona in his Italian Baldus,

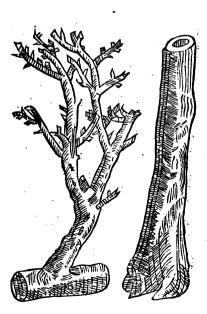

4. Affalathus fecuadus Dioscoridis legitimus Pana. Dissaides his true (econd fort of Affalathus according to Pona.

1. Afpalathus alter Monfpelienfis.

7. Affalatus primus Dioscoridis odor atus? The first and sweeze Affalathus of Dioscorides.

LOOT

CHAP. 20.

wherein is many more rare plants fet forth then is in the Latine, and received from Signer Comains, who had Garden stored with the rarest plants that can bee gotten from all parts) is as the fails Bellar sinh grants knowne through all Gracia reteining yet the old name, wherewith they not onely make hedges and fensis their grounds but in some places whole Groves are found stored therewith: and is a small hedge bush risner with many upright stemmes, branched forth into many parts, set full of small sharpe white thornes on all without order, and at every thorne on the young and render branches one trefole pale greene least upon a lot footestalke, whose ends are round and dented in in the middle: the flowers stand at the toppes divers set the twinth are fashioned like unto Broome showers at some times, and places, wholly yellow, and at othe more reddish or inclining to purple, of so sweets a sent that with the winde it is felt agood way of when showers are fallen there come up in their places small pods, containing within them some or we small reasted like Vetches, lesser then those of Acasia altera: the roote is wooddy and brancheth forth in the grant sending forth suckers whereby it is plentifully encreased: the substance of the wood is very hard havy as white, the heart or core whereof is blackish and utterly without any sent while it is greene, but dy sent better.

5. Aspalathus primus Dioscoridis adoratus. The first and sweete Aspalathus of Dioscorides.

Although this plant be not throughly described and set forth as the former is with the leaves, sow created being but declared with the trunke or body and with an arme and a few branches cut short with thoms there appearing, yet I thought it not inconvenient to set it forth as it is extant with so much description as is added to it, that others may understand thereof and have thereby some knowledge of it, to further them when they had happen to meete with it. The barke of the tree is of a blackish ashcolour, of an astringent and somewhet him taste and biting withall, which being taken off, the inner barke is of a faire purple colour, especially the inner most which is very thune, sine and full of small strings or threads, the substance of the wood is sine and but strings that the substance of the wood is sine and the substance of the wood is sine and substance of the wood is sine and the substance of the wood is sine and the substance of the substance of

The Place.

The first groweth about Salamanca in Spaine, as also about Mompelier and in Narbone of France the second in old Castile in Spaine: the third at the foote of the Pyrenean hills towards Spaine: the fourth in Canty in diven places in Greece: the last is not declared from whence it came.

The Time.

They all flower somewhat early in their naturall and warme countries, and give their fruit or seede in Summer; but in these coulder climates they will hardly endure the first colds of our Autumne as my selfe have proved who have had them sprunge from the seede that I sow ed and have abiden onely the Summer Season.

The Names.

The Greekes call it amaans Apalathus, and so doe the Latines also, yet Pliny from Dioscorides sinhicute also called Eryssceptrum and of some Sceptrum. The first three forts Clusium doth acknowledge are noted then the true Assaurant and the others. The first three forts Clusium doth acknowledge are noted then the true Assaurant and the other state and the other state in the calleth it of and the other state into it) he calleth it and them Assaurant alter primum secundam & tertical the first so calleth it Assaurant entituleth them all Gradus sparium spinosum as Lobel doth, set forth in his Icones; but in his Observations he calleth it Assaurant so consider to the state of Commissions, Assaurant so calleth it also seems the source of saute; Angustara tooke it to be Acacia altera, and Tabermontanus calleth it Scorpius minimus: the fourth is the Acacia altera of Comethicus, Lacuna, Lonicerus, Lobel, Lugdunensis, Gesur and Camerasius; the fourth is the Acacia altera of Comethicus, and throughout all Grecia it is called Spalathus to this day, and therefore is consider to call it Assaurant sautes of Coordia, as Guilandianus in his Epistles did before him. Who was Bellus his Turour but Bankium beause he would go with the greater although not the better number as it should seeme (for he quoteth the sausandors himselfe that I doe here, both that call it Acacia and Aspalathus) calleth it Acacia trisoliathe last onely sausting the forth in his Latine and Italian description of Mount Baldus, who saith that the wood is sale, and yet Bankus cortice cinereo ligno purpure making the wood to be purple when as nothing but the inner tinde is so. Classus saith that the Spaniards call the first Eulalia, the second Anlaga, and the third Hallada.

Avicen (aith that Apalathus is hot in the first degree and dry in the end of the second, almost to the third. Disferides saith it hath an heating qualitie with some aftriction, but Galen lib. 6 simpl medicament saith thus. Affer saith is in taste sharpe, together with some aftriction also, the faculties therein being of unlike parts, to we sharpe whereby it is heating; a dharsh or sowre, whereby it is cooling by both which it is drying, and the dry good avainst putters thereon and Fluxes of all sorts: a decoction thereof made in wine and gargied in the months singular good to heale the sowle Vicers thereof, as also those in the nose to be shufted up or injected, as so those vicers of the genitoryes or secret parts, if they be bathed therewith: the said decoction shyth the first of the belly and help eith the spitting of blood, it helpeth also those that cannot make water, and dissolves windy swellings. Pliny sorts the same, and surther saith that it helpeth the chappes in the hands or other parts, and that the barke is effectuall against the strangury, as also availeable to binde the belly, and the decocion three stayed bleedings.

CHAP. XXI.

Genista Spartium spinosum. The pliant thorny Broome.

F this kinde of Plant Baubinsu maketh many forts, some whereof I have placed in the former Chapner as fittest for that place in my opinion rather then this, the rest shall be declared here.

This finall thoray bush rifeth about a foote high set with most sharpe thornes, placed in order two ment method against another, of a pale greene colour, many branches of these thornes springing from the mix summe up to the toppea the ends where of stand three or four essent by ellow Broome-like flowers as are which set in the Furse bushes, after which come small short pods so enclosed in a hoary woolly downe that they make single encovered with copwebs, wherein lie small seede lesser than Vetchessthe roote is long and spreadown.

1. Genifia spartium spinosum Syriacum. The pliant thorny Broome of Syria.

This princip bush riceth up more then a cubit high, set with divers branches and small long ash-coloured bush gentle then the other, and more sparsedly placed also, having divers long and narrow seven as the state of the state of

Thishorny Broome rifeth up with a wooddy stalke or stemme covered with a blackish barke, spreading suninfluide blackish branches, and they againe divided into smaller like rushes, all ending in sharpe thornes, besigned objects, set here and there at the joynes of the branches, where also come forth sine small hoary leaves
strengther the flowers are small and yellow succeeded by small long pods and small seede in them.

instruction of the first and there at the joying of the branches, where also come forth fine imall hoary leaves it together the flowers are imall and yellow increeded by small long pods and small seede in them.

4. Spartum finosum alima Creticum. Another pliant thorny Broome of Candy.

Ihre joying the figure hereof with the foregoing plant, and that it should not passe undescribed, but take it high built groweth very tall & high busheth and brancheth forth very much, the stender stable greene branches the stable growth in the spots having three small leaves at a joynt, with yellow showers and small postumwards; each branch and twigge ending in a long thorne at the last.

5. Erinacea Hispanica Clussis. Clussis. Clussis the spanish Hedgehog Thorne.

This notifie rare then daintie bush groweth to be scarse a soote high spreading many stalkes and branches one

Thinodele rare then daintie bush groweth to be scarse a foote high spreading many stalkes and branches one instituted among another, and all set in a round forme or compasse replensished with a number of cruell sharpes procedure: at the topper of the branches stand three or source slowers alwayes together of the same fashions white former, but of a blewish purple colour set in rough and hairy hoary huskes, while it sloweth there are

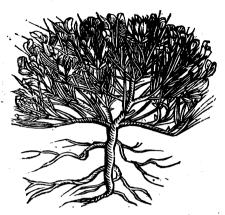

1. Genilla Spartium fpinofam minus. The lester pliant thorny Broome. 3. 4. Spartum frinofum Creticum duarum facierum.
The two thorny plint Broomer of Cande.

TRIBAN

5. Erinacea Hifbanica Clufij. Clufius his Spanish Hedgehog thorne.

some few small leaves to bee scene upon it in fundry places, but they prickly wither and fall away, leaving the buff w thout a leafe thereon all the yeare after, which by the round forme of the branches with the thorner fricking forth, doth represent a Hedgehog so firly that the inhabitants thereupon have termed it Erizo, that is, an Hedgehog, the roote spreadeth many long strings and sibres on them under ground.

6. Echinopoda frutex Creticus. The Hedgehog Thorne of Candy.

This other small Thornic bush groweth up with many thorny greene sprigges and branches set close together, having alwayes three prickes or thornes growing together at every place, and is seldome seene likewise to have any leaves thereon because they fall away so quickly; (Apinus faith it never beareth any) the flowers hereof groweth at the toppes of the branches in great plentie (but Alpinus denyeth it and faith it beareth but very few) are yellow but like the other in forme, wherof the Bees never doe talte, Itanding in whitish greene huskes, a little hoary all over, and afterwards small pods with very small seede in them; this is very tender to keepe, not enduring any cold place Sommer of Winter. Echinus Creticus.

The small round Hedgehog Thorne of Candy.

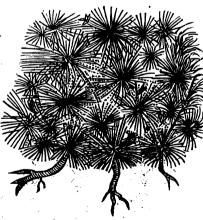

This Thorne (faith Alpinu) doth better resemble a

Tragacantha then the former Echinopoda as Honorius Bellus would have it: for this round formed thorne is not much bigger then a hand Vrchin or Hedghog, scarse rifing above two or three fingers from the earth, but spreading the blacke branches halfe way within the ground, very thicke fer together, and shooting out small rootes at the joynts as they spread, all whichend in small thore white and broad tharp thornes thwarting one another thereby forming as it were crosses or starres, not having any leaves at all upon them, but innumerable small flowers like unto Historiaths for their forme, but much finaller, after which succeede small long pods like unto those of the other Tragacanth: it-groweth round and fpreadeth not further out of that forme : the Candiots call it Caloschirrida.

6. Echinopoda frates Creticus, The Hedgehog Therne of Canig.

7. Echimus Creticus. The fmall round Hedgehog Thorne of Candy.

The first as Clusius faith groweth on the hills neare the kingdome of Granado going to Cordaba : the second Raumolfius found about Aleppo in Syria: the third Cluffus found in the kingdome of Valentia in Spanishout a fault towne called Stete aguar most plentifully, which is in the way to Madrill: the last Billmins faith growth in The Candy, and Honorius Bellus faith in all Gracia likewise besides.

1 The Time.

Mitte doe flower in the beginning of Sommer, yet Gluffus faith hee found the third in flower in Aprill Lockerew naturally. The Names.

Laures Haid intituleth all these plants Goniffa Spartium Spinofum, calling the first minus, because he made Life in the last Chapter to be majus. Clufius calleth it Scorpius focundus, and thinketh it may be the Echi-Morita of Honorius Bellus for that as he faith it grew very like it, and Lugdenenfis termeth it Afpalathus fe-Constant from the Apartin spinosum alter is, Cesal pinus Spina Christiand Dodonaus Geniste spinose altera and Telementanus Scopius tersius: the second Lugdonausis in his Appendix the with out of Rannolsius and Telementanus Scopius tersius: milhathe Moores of Aleppe did call it Albagi, on whole leaves a kinde of Manna called by the Arabian: Teissulhat the Moores of Alappo did call it Albagi, on whose leaves a kinde of Manna called by the Arabians Teiss, and by the Moores Transchibin was used to be gathered, especially in Persia, and talleth it Planta spinosa
issue albagiand Baubinus Genista spartium folist polygonisthe third Albagiand Baubinus Genista salleth Sparissue albagiand, and the fourth Sparsin Cretin it the fift Clussus calleth Erinatea from the Spanis word Ereza, for the
issue of the fourth Sparsin Cretin it in the first clusses and thornes unto an Hedgehog, Cesasinus calleth it Genista rounde
issue of the Sparsin applies fruites and thornes unto an Hedgehog, Cesasinus calleth it Genista rounde
issue alleth it Sparsin applies fruites and the fourth Genista spinosa bumis. The summans Scorpius quartus and
form and estima applies : Gerard maketh it his fourth Genista spinosa bumis. and saith it groweth in the
fourth Welt spits of this Land, but sure I am, he is much milte ken therein, for in his description hee saith it
the slow flowers which this hath not a Baubinus calleth it Genista sparsium spinosa sure sure of the sure of the saith it sure sure of the manuel of the state of the stat in standes purpurafeentibus: the fixt is mentioned by Bellenius in his first booke of Observations and 18. risestantes purpurajeentions: the text is mentioned by Benomus; in his first booke of Observations and 18, Conveiling it Ashinopoda, and as he there faith is very like unto Afpalathus, but Honorius Bellus in his secondifies to Clustus contraryeth him therein. Shewing that Echinopoda differeth much from Appalathus both in injunction the plant or bush, being much greater them Echinopoda, as also having sewer thornes, and three lines to be plant or bush, being much greater them Echinopoda, as also having sewer thornes, and three lines to be very common in all Gracia, and in had (wor Sie, and that Dalechampius was much deceived herein in his marginall note upon Athaneus, which such as a nut tent the service of the general, and that it may appeare to bee commonly growing there, and in general service, such that it is supplied to bee Cardui Chi general, and the conditions towards the end, setteth downe this old Diffichon, Inter Echinopodas welut, after am & inter Ononim,

Interdum crescunt mollia Leucoia.

Antiboth Albertons likewife mention it in his third booke of Dipnofophiftes, as ftill growing among Ononis and thansik file being one, Pliny also in his eleventh Booke and eighth Chapter mentioneth it under the name of Chapter Guilandinus knew it not, for in his Epistle to Langius he numbreth it among the unknowne n'ants to him. The Vertues.

The frond Rannolfins faith is hot and dry, and that the Syrians with an hand full of the leaves make a decoctimin water and drinke it, whereby they purge themselves a but I doe not finde any mention of the vertues of molitherest of these plants, eyther used by the learned or by the inhabitants where they grow, and therefore will can learne more of them I must be filent alfo.

CHAP. XXII. Scorpius five Genistaspinosa. Thorny Broome and Furse.

Aving as well before in this Worke as in my former Booke shewed you all the forts of smooth Broomes or without tho nes, and in these two last Chapters divers thorny bushes comming nearest to the thorny Broomes, it remaineth for me to declare them also, which although some grow so wild on barren heaths and dry grounds in our owne Land that they are not thought fit to bee planted in a Garden, yet there be divers others that are, let me not therefore sever them into many places, but ser desingether in this Chapter, the common Furse bushes being of the same tribe or family.

1. Genifta spinosa major vulgaris sive Scorpins Theophrasti quem Gaza Nepam transtulit.

The ordinary great Furse bush or Scorpions Thorne of Theophrastus. Orodinary Furse or Gorse (as it it called in some places) is well knowne to grow much higher in some places is well knowne to grow much higher in some places is well knowne to grow much higher in some places. Which is to fend forth many wooddy grayish stalkes full of banks, and fit with sharpe long thornes on all sides, so thicke that it seemeth nothing but thornes, and is seldentine to have leaves on it, for if they be not heeded in the Spring when they come forth on finall stalkes, beignatiand almost round, yet pointed at the ends, and some a little narrower and longer, many set toge-attended sides of a middle rib, of a grayish greene colour above, & sliver like or hoary white underneath, they with all away and are not feene, fo that many have thought it never bringeth forth any: the flowers are ma-linding at the toppes of the branches, like unto those of Broome and almost as yellow, but not so thining, afmakich inceede thickeand fhort pods covered with a whitish hoary freese, and with a twining pont or end, but mare contained small brownish seede : the roote is long tough and spreading.

2. Genissa spines also. The white flowred Furse bush.

hate North parts of this Land I heare that in divers places, the Furse or Gorse bushes as they there call them

the tree white a tarrey white flowers, differing in nothing else from them that beare yellow, for they are oftentimes seene and growing together in one ground.

1. Genissa spinosa minor. The lesser Furse bush.

The lesser Furse bush growers alwayes lower, full of branches, and with smaller and shorter thornes thereon hathelormer, this hath many small greene leaves standing in the same manner which abide much longer on the way before they fall away, which is not untill the end of the Spring or beginning of Summer, to that thicking and flowers are oftentimes seene a good while together : the flowers are smaller then the former and

P.111. 1.

TRIBET

of a paler colour: the cods are finall and short without any freese upon them, blackish when they are ripe, and the seede reddish

within: the roote is long, tough and wooddy.

4. Genistella sculeata. The totall prickly Broome.
This fmall Broome fendeth from the roote divers upright flender greene stalkes set with many small sharpe and short prickles on all fides from the bottome upwards; and branching forth into divers parts, having many fmall hard greene leaves growing on the younger branches, at the toppes whereof fland many small pale yellow flowers, much fmaller then any of the former, and imall long pods a little pointed with (mall feede therein following them : the roote groweth not very deepe, but fpreadeth tough long (trings.

5. Genifella Monspeliaca spinofa. Small thorny Brooms of Momselier.

This Frenchthorny Broome hath divers flender pliant twigs bending downewards, of a (pinne long or more, whose lower part is divided into many very thout branches which are nothing but thornes, and from the middle upwards spread also into branches that are hairy, but without any thorne or prickle on them, having many finall hoary leaves fet on them and fome fmaller alto with them : at the toppes grow fuch pale yellow flowers like Mi or Hi unto the last. A greater fort hereof hath beene brought out of Spaine.

6. Genistella minor Aspalatoides. Small prick'y Broome like Afpalatins.

This small bush groweth a foot high or more, with a round wooddy stem covered with a reddish bark, tet here and there very spa-ringly with some few small thornes divided into branches, which likewise are parted into other smaller branches, whereon are set a few finall and long leaves, and fome more round also, the flowers stand not all on the toppes, but some from the besome of the stalkes and leaves, not much smaller then the last, and of as pale a vellow colour, the branches not ending in a thorne as it doth. The Place.

The foure fielt forts grow in our owne Land on dry barren

Ginifta (pino (a minor. The kill r Farie buth.

The Theater of Plants.

ister wafte gravelly or fandy grounds, and so doth the last as also about Orleance; but the first is found wafter and liath beene brought out of Spaine likewise. The Time.

Total flower in the Sommer moneths but the greater forts fomewhat earlier then the leffer.

Will ingenerally taken to be the oxion Scorpius Theophrasti, which Gaza translateth Nepa in lib. 6. cap. 1. The ingression of Scorpins are wholly composed of thornes, but not that Scorpins lib. 9.c. 14. whole was last correspond to Scorpins and Scorpins and Scorpins and Scorpins lib. 9.c. 14. whole the hunder of the fore night Hooks which doth not many our not man occupies lib. 9.c. 14, whole which doth represent a Scorpion, and is good against the sing thereof, and which hee calleth Telephonon the photo of the fame ninth Booke, which doth most properly decipher out the Doronicum whose ist is the property decipher out the Doronicum whose ike in Complete of the Deronicam whole were the Deronicam whole were like unto Scorpius is πλύτημος Poly[emos as I have fitewed before, for that the word Scorpius is πλύτημος Poly[emos as the second of the secon manie very like union like the state of the in word or many in the control of th by comming this prickly acorpies with the other: I he first is the acorpies primes of Clefies, Scorpies alter and Genifes [pino] of Dodoness; Banhines calleth it Genifes [pino] of Londoness; Banhines calleth it Genifes [pino] of interesting the first and the first as I take it peculiar to our owne Land, and not mentioned by any before in Banhines referreth it to the next : the third is the Nepa Theophraft of Lobel, Cameraries and Talentani, and Scorpies Theophraft of Lugdunenfit, Scorpies five Nepa of Anguistara, and called by Banhines (coils pino) a mojor brevibus acules: the fourth is the Genifella of Tragus, Fuchius, Dodoness, Lugdunenfit and Coils pinola with Coils and Coil Gape part | may Genista vel Genistella spinosa of Gesner in hortin Genistella annienta of Lobel (who thinketh it may Thomsens, General Description of Principal Conferments and Lonicerus, called by Cafalpinus Coroneola similis suffrusex, and by labous Genisa spinosa minor Germanica: the fift is called by Baubinus in his Pinax Genisa spinosa minor Him tornel lates : the last Baubinus calleth Genistella minor Aspalatoides vel Genista spinosa Anglica, saying it states out of England by the name of Gensifa spinofa (which is probable was found in some place of our Land minumetous as the plant it selse is, and sent him as a raritie, who saith the like thereunto was sound about chamit in France. The Italians call the first Scorpione herba, the Dutch Guspeldoren, and wee in English Furse, Grend in Crame, and thorny Broome, but that may be generally given to all these thorny bushes, and surprisinally is appropriate to the fourth sort, which the French call Genesse picquant, the Germanes Stechand Thomas and the Dusch Stechende Brem, and we in English the small prickly Broome. The Vertues.

Thinft and third are held to be hot and dry, good to open obstructions of the Liver and Spleene, some have neductioned of eyther in a decoction against the Iaundies, as also to provoke Vrine and to clense the Kidneyes of gard or flones ingendred in them. The others no doubt are participant of the same qualities.

CHAP. XXIII.

Rhamnus. Buckes thorne.

The Nder the name of Rhammus are comprehended divers forts of shrubbes, some much differing from Rother: the elder age in Theophrastus his time acknowledged two forts, the one white, the other blacke and both ever greene : Diefcorides in his time acknowledged three which have beene controverted by and both ever greene: Disjournes in his time are force forces found out; fome of our later writers have Melene Rhammus folutions, that is, purging Ramme, as a diffinction from the other that are not fo, whereof lamentreated in the second Classis of this worke, and of the third Rhamans of Dioscorides (as the most judicimanuscount it) called Palinrus. Christs thorne, I have entreated in my former booke : the rest that are reindustrianto and called Rhammus by other authors shall follow in this Chapter, and beginne with that wais most frequent in the Low Countries by the Sea side as well as in the upland countries, and in our owne balby the Sea coalts in many places also.

1. Rhammus primms Diofcoridis Lobelio five littoralis. Sea Buckes thorne with Willow-like leaves. Bis Buckes thorne (hooteth forth many and fundry pliant twiggie flemmes branched into divers finaller branharcon are fet many long and narrow leaves without order, covered as it were with a white dust or with divers small thornes standing among them: at the joynts with the leaves modemiddle upwards grow fundry small greenish mossie flowers together, which turne into round berries, see the fift, and of a yellowish rednesse when they are ripe, having a juice or slessife substance within the cutties, and a flattish round gristly kernell within, of a blackish browne colour: the roote is tough, long, and tradigment under ground 1 this abideth with the leaves on the twigges all the winter long, and so doth the laid the

being spon Matthiolus fetteth downe that this Rhamnus doth varie in some places neare the Rhyne, viz. that the but that bath broader and longer leaves hath but one or two bergies fer together upon a stalke ; but that that growth by the Danow and the River Lycus hath shorter and narrower leaves, and hath divers berries

2. Rhammus fecundus Monspeliensium sive primus Clusij. White flowred Buckes thorne. Basackes thorne is a bush fit to make hedges withall, rifing up with divers straight upright stems, sidinto many branches, armed with very strong and sharpe thornes standing out, from whence the small siding out, from whence the small siding together, almost round arthe point selections the standing together, almost round arthe point selections. thing away before other have forung forth: the flowers fland at the fayd joynts with the leaves in hoary three or foure together, being somewhat long and round ending in five leaves, of a pure white colour there they are fallen a certaine round thing groweth like unto that of the lasmine which feldome commeth

The my futte: the roote is thicke and long creeping farre away.

Wallnut tree leaves grow, but each leafe refembling those of the greatest Myrt le : at each knot on the bracks Wallnut tree leaves grow, out can remembring those of the great fide; the further relation were the leaves those fland one or two small short weake thornes on each fide; the further relation were the give v. u because the plant perished through the intemperature of the climate. The I lace.

The first as I sayd groweth not onely neare the Sea coasts in the low countries and in our Landalso, but in the The first as I sayd growers not onerly heare the Sea Coatto in the low countries. Gefner, Clufins and others have fire uplands also of the higher and lower Germany also by rivers sides, as Cordus, Gefner, Clufins and others have fire uplands also of the higher and lower Germany also by special downe : the recond as compared factor of the kingdome of Valencia in Spaine about the Citie Homelange the River Sagura and in no place elies the fourth he likewife faith he found plentifully among other funding the waste grounds of the kingdome of Granado and Murcia.

The Time They flower in the Sommer, and the fruit is ripe in September. The Names.

There is great controversie among our moderne writers as I said before concerning this P 440 Rhammu, a the There is great controverine among our most in white and the sufficient buffs or other thereunto, for Company and Latines call it, every one almost appropriating one thorny buffs or other thereunto, for Company and Tragus judge the Groffularia or Vna crifpa our Goose berry tush, to be the Khammi tertium genus of Diffui. and Tragns judge the Groffntaria of rmacry po our Source berry turns on the state of the Spina infection before let forth in this worke to be Rhamni alia species, not knowing any prigns des, nd call the Spina infection abefore let forth in this worke to be Rhamni alia species, not knowing any prigns design of the spina infection of falling and share upon called in Rhamnus Cathericas or falling and share upon called in Rhamnus called i qualitie therein as others afterwards did, and thereupon called it Rhammus Catharticus or folutions. Mathehat tetteth forth likewise a kind of prickly bush for the Rhammus secundus Dioscoridu which Pena and Lobel milke. giving another in the flead thereof, which they fay commeth nearer to the description of Disserting and the flead thereof, which they fay commeth nearer to the description of Disserting and the flead thereof. the ancient authors themselves are not constant nor free of variation herein: for as before said Disserted hath three forts of Rhamnus (whereof the third fort is much doubted of by divers, some thinking the Textof Disce. des to be corrupt, and the third fort to be added or superfluous) Theophrastus hath but two forts, white and backet and mentioneth Paliurus as a peculiar p'ant by it felfe. saying also it is of many sorts, and Galen maketh manion but of one fort, as if there were lut one or that the rest were comprehended under that one. Playmakehtwo forts, but he without consideration referreth them to the Rubus or Bramble. The first here fet forth in the Rubus nus fecundus Diofeoridu of Marthiolus, Dodoneus, Clufius, Lugdunenfis, 28 2160 of Lacuna and Londerus, tu Pead and Lobel in Adversarys make it the first of Dioscorides, Cordus upon Dioscorides and in his history also allethic Oleaster Germanicus, and in his Observationum Ilva, Oleastri peculiare genus : Camerarius in borto and in Entre calleth it Rhamni species, and Casalpinus Rhamni alterum genus, Bellonius in his Observations maketh mention of a Rhamnus haccis rubentibus which it is probable is this. Columna taketh it to be Hippophae Dioscoridu, and Bashinus calleth it Rhamnus Salicis folio angusto fruellu flavescente : the second is the Rhamnus primus Dissentino Matthiolus, Anguilara, Lacuna, Loniccens, Clusius. Dodonaus, Lugdunensis and Ranwolfins; Lobel callethis Rhomnus a'ter Dioscoridie Monspeliacus, Cordus upon Dioscorides and Baubinus call it Rhamnus candida Theophasti, as alfo Rhamins (pinis oblongia flore candicante. Ranwolfius faith that the Arabians call it Haofer, and they about Tripoli in Soria or Syria Hanjegi : the third is Cluftus his Rhammi primi altera Species : the fourth ishis Rhammi tertius, and to also it is of Dodonass and Tabermontanus, and of Lobel Rhamuss prime Species tertius and is likely to be the Rhammi genus baccis nigris in Gracia of Bellonius, Banhinns calleth it Rhammus niger Theophrasiians Rhamnus tertius flore herbaceo bacem nigrin : the fift Lugdunensis exhibiteth from a skilfull Herbarist as hee suih that brought it to Dalechampius gathered in Bavaria, and not knowing unto what plant to referre it better called it Rhamnus Bavaricus, which name doth so continue untill it can be better disposed of : the last lacobus Countin onely exhibiteth in his Canadersium plantarum historia The Arabians call it as is aforesaid : the Italians Rams and Mauruca, the Spaniards Scambrones, the French Bourgespine in some places, for that name is given todivers plants in fundry places : Anguilara faith that generally Diofcorides his first Rhammus is taken to be that plant which at Rome is called Spino Santo, and of others Spino de Christo, Marcellus in his booke de re medica calleth it Saluta ris herba and spina alba: Cordus also witneseth that Rhamnus is called by the Latines Spina alba, but wifely adviseth that this shrub Spina alba be not confounded with the other two forts of Thisles so called also. Ovid also speaketh of it lib. 6. fastorum, shewing the use of it in his time to expell incantations in these verses, Sic fatus, Spinam quatristes pellere posset

A foribus noxas, bac erit alba, dedit

And in another place not farre from the former he faith the fame of the same plant, otherwise called Voga Issain in this manner:

Virgaq; Ianalis despina sumitur alba. Qua lumen thalamis,parva senestra dabat. The Vertues.

These thorny plants are in qualitie one much like another, being as Galen faith cold in the end of the full degree or in the beginning of the fecond and drying and digefting in the fecond, and thereby helpeth inflammati ons, Saint Anthonies fire and other fretring and eating Cankers and is good against pushes, wheales, &c. inting the young leaves whiles they are fresh. Adecoction of the leaves and inner barke thereof made in water where unto a little allome is put is very good to wash the mouth when there is any inflammation or Vicer or other difi ale therein. (Clusius faith that the Spaniards doe eate the young shoots of his first Rhammu as a Sallat herbs. and that they use the decoction of the Blacke berries of this fourth fort, to bathe those places that are out of joynt, and to helpe the paines of the Goute.

CHAP. XXIIII.

Lycium sive Pyxacantha. Box thorne.

Lthough we are not certaine that any of these thorny shrubs here set forth in this Chapter is the true and right Lycium of Dioleorides agreeing thereunto in all things, yet because all of them have some contents of the state of t formed upon it or Galling a state of them to formed upon it or of them to formed upon it or Galling and of them to formed upon it or Galling and of them to formed upon it or Galling and of them to formed upon it or Galling and of them to formed upon it or Galling and of them to formed upon it or Galling and of them to formed upon it or Galling and the formed upon it or Galling ferred unto it as shall be shewed.

This's 9.

1. Lycium vulgatim, The more common Box thorne. Themore common Box thorne is a shrubbe or low tree yet growing sometimes foure or five cubits high, with maghtanches foreading therefrom, covered with a darke greene barke, fomewhat grayish in the body and older heres fet somewhat thicke with small hard and almost round leaves like Box, two for the most part at a joynt. howwhence also thrusteth forth a small sharpe thorne: the flowers grow many together in a cluster at the sevehis washed wards of a greenish colour, after which come small berries, greene at the first and blacke when they ne print up the bigueste of Privet berries but full of a bitter unpleasant sappe: the roote speadeth diversity.

2. Lycium Italicum. Italian Box thorne. The Italian Box thorne is a smaller and lower shrubbe, whose older barke is rugged and of a darke colour. but the branches ending in a thorne, whereupon are fet small leaves tendations the edges ver like unto those of the Sloe bush, and of a darke greene colour, harsh in taste and somewhite with a leat the joynts with the leaves come forth a few flowers of a, whitish greene colour, made of furtheres a peece, after which follow small greene berries and blacke when they are ripe, with two and somethe with three leaves as it were on the betrie: the roote is wooddy and spreadeth.

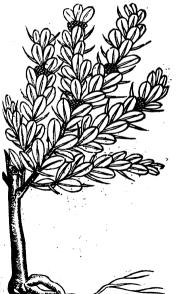

3. Lycium Hifpanicum folio Buxi. Spanifo Box thorne with small round leaves. The Spanife Box thorne hath divers flender but yet upright stemmes about two foote high, covered with middhbrike parting into many branches every one not onely ending in a thorne, but having divers thornes fribbsteand there upon them, many times but weake and thort, and at other tharpe and ftrong with many lengeowing on them, formewhat like unto the small Box Myrtle leaves being of a clammy acide taste. somewhat bitting, neyther flower nor fruit hath beene observed hereof.

4. Lycium Hispanicum folio oblongo. Spanish Boxthorne with longer leaves. This other Spanife Box thorne rifeth up but with one stemme, parted into fundry branches whereon grow be and narrow leaves fet without order.

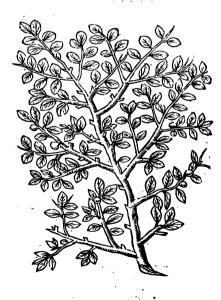

5. Lycium latifolium Monspeliacum. Broad leafed Box thorne of Mompelier. This cruell thorny bush groweth and spreadeth like an hedge bush, set thicke with sharpe long thornes, and fers layes formew hat broad with them, whereat likewife come forth fmall flowers which turns into fmall beries, Backe when they are ripe, three for the most part standing together, having a reddish yellow juice with-inten, giving that colour on paper, leather, &c. and with three seedes in them, and of a quicke sharpe taste. 6. Lycium Gallicum Avenionense. The yellow graine of Avignen.

This thomy (hrubbe groweth to the height of three or four cubits, whose lower barke is of a gravish ashcon lour freeding divers branches ending in thornes, fet at the joynts with many small leaves very like both for color and thicknesse unto the small Box but somewhat narrower and longer, whereat also come forth small bwes and after them small berries upon short footstalkes some being three Guare and others source square agarding to the number of graines within them, at whose head is set a small cup or cover, and is of an altringent take, formewhat bitter, which being dryed are much used of Diers and others to give a yellow colour.

1. Lycium vulgatim.

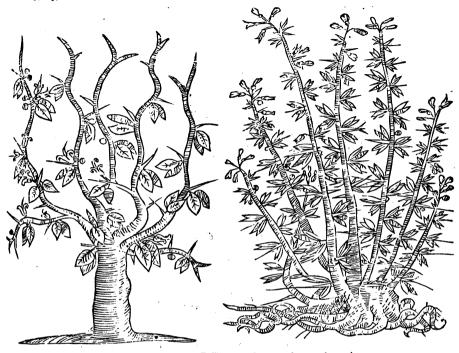

2. Lycium Italicum. It alien Box thorne.

TRIBEO

10. Lycum Indican crediton Alpino. The supposed Indian Box thorne.

7. Lycium Creticum primum Belli The first Box thorne of Candy. This Cardian thorne groweth to be foure or five cubits high covered with a rough or teabbed barke, of a gray? inclour, flored with sharpe thornes, three alwayes growing together at a joynt, where the leaves also come fust three or foure together which are small somewhat neare unto Box leaves, and lesser then those of the Barbary bush, lightly snipped or dented about the edges: the flowers are yellow comming forth at the immwith the leaves which turne into small long berries not fully r und, therein somewhat like unto a Barbary bulkacke when it is ripe, each of them standing fingly by it selfe upon a small stootestalke, of a talte betweene were and fower: the wood hereof is yellow and the roote much more giving an excellent yellow dye: divers breaccounted it a kinde of mountaine Barbary for the refi mblance thereunto more then unto Lycium; but it difficultifrom the Barbary in that the leaves thereof are greater then of this, and the Barbary hailt the berries gowing many together in a long cluster, and this but fingly one at a place as is before faid, and from the we Lycium it different in the fruit not being round like Pepper, and is not bitter as the berries of most fort of

8. Lycium Creticum alterum. The other Box thorne of Candy. This other Candian bush riseth up not above two or three cubits high thicke set with branches and thornes, and feelleres upon them, the berries are round, as imall as Pepper and blacke when they are ripe, whereof is made

marchent yellow colour.

9. Lycium legitimum Rauwolfij. The true Box thorne of Syria.

The true Box thorne as Rauwolfius fetterh it forth in the fourth Booke of his journall of Itinerary is a small brobehaving many shoots from the rootes, set full of thornes and small leaves somewhat like unto Sloe leaves whetweene them and Box.

19. Lycium Indicum creditum Alpino. The supposed Ind an Box thorne.

This Box thorne supposed to be the right Lycium Indicum by Prosper Alpinus in his Booke of Egyptian plants, boreth from the rootes divers upright wooddy ftemmes three or four cubits high, fer thicke with joynts, at eve-Tone whereof come forth both long and sharpe thornes, and foure or five small long whitish greene leaves ionmanower and whiter then those of the Olive tree : at the joynts likewise with he leaves fland two or three which flowers, very like unto those of the Orientall Iacinth, which turne into small and blacke berries hylikeunto Wallwort berries of an aftringent and bitter tafte.

11. Lycium Indicum putatum Garfia. Garfias supposed Indian Box thorne. Varies at Orta in his first booke and tenth Chapter of his Indian history of Drugges sheweth that the Indians, lefar and other nations of Asia major, use a certaine juice which they call Care or Care, mixed with Betre and Anagural mations of Agrammyor, the a certains just their mouths, which he thinketh to be Lyoum, having

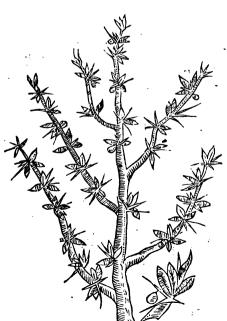

4. Lycium Hifpanicum folio oblongo. Spanifi Box thorne with longer leaves.

7. Lyctum Creticum primam Belli. The first Box thorne of Can'y.

Lieitin Cretican alterna

the properties of the true Lycium, the juice the eof being drawen forth in the same manner that the ancions and the properties of the true Lycium, the juice the eof being drawen forth in the same manner that the ancions and the control of the con the properties of the true Lycium, the junctime of the described it doth much differ from that of Disserting the the true Lycium was made; but the tree as he described it doth much differ from that of Disserting the true Lycium was made; but the tree as he described it doth much differ from that of Disserting the true. shew the true Lycium was made; out the tree as he described in a final leaves thereon like not head as Garciae faith his is a great tree asbigge as an Ash tree, having fine small leaves thereon like not head as Garciae faith his is a great tree asbigge as an Ash tree, having fine small leaves like R = fait con Head as Garciae faith his is a great tree asbigge as an Ash tree, having fine small leaves like R = fait con Head as Garciae faith his is a great tree asbigge as an Ash tree, having fine small leaves thereon like now Head as Garciae faith his is a great tree asbigge as an Ash tree, having fine small leaves thereon like now Head as Garciae faith his is a great tree asbigge as an Ash tree, having fine small leaves thereon like now Head as Garciae faith his is a great tree asbigge as an Ash tree, having fine small leaves like R = faith faith his leaves like R = faith faith faith his leaves like R = faith faith his leaves like R = faith fai as Garcias faith his is a great tree asough as an out the state, having the leaves like B x, full of thomes and Tamariske (whereas Diofeorides faith that his Lyciam is a shrubbe with leaves like B x, full of thomes and Tamariske (whereas Diofeoraes tatth that this Distance is a limited with the Color and a full or thomes and a wayes abiding greene) it beareth flowers but no fruit as the inhabitants reported nuto him: the roote of the manufacture is the color of the meather, nor furnishing the color of the meather and the color of the color of the color of the color of the meather and the color of t wayes abiding greene) it bearett nowers out no must as the inhabitants reported dute must it the roote of the main is firme heavy and strong, neither subject to rottennesse exposed to the weather, nor swimming in the water, and

12. Agiahalid Agyptiaca Lycio affinis. The Egyptian tree like unto Lycium.

12. Agiahatia Agyptiana Lytto appears. I the Lagret man from the height of a wilde Peare tree, having but few armes or branches crooking many.

This tree groweth to the height of a wilde Peare tree, having but few armes or branches crooking many. This tree growing to the height or a winder reason tree, having our family Box like leaves with them ber wayes in the growing, fet with many long and very sharpe thornes and small Box like leaves with them ber wayes in the growing, let with many long and very therpe thornes and all and white like Orinness has broader, feldome but one and usually two at a joynt, the flowers are small and white like Orinness has been britten and all income like Orinness an fomewhat broader, seigone out one and all mal blacke round berries both bitter and aftringent: the leverage are tomewhat fower and aftringent.

The Place.

The first groweth on the Alpes of Liguria and in Dalmatia as Lugdunens faith: the second on Mount Paldy and in divers places of Italy the third Clusius faith he found neare unto Complutum in Spaine by the Rivensider. and in divers places of Italy . The third Compression it the first as Lobel faith groweth not farre from Champler the fourth Lobel faith was brought from Spaine: the fift as Lobel faith groweth not farre from Champler the the fourth Lopestatth was orought from open and Carpentoralle in France: the feventh and eight in Cost as Honorius Bellus fetteth it downe in his first Epistle to Clusius: the minth on Mount Lybanus and other places as Honorum Bellim lettern it downe in institut spilite to a life that is called Calig that runneth into the Sar the eleventh groweth as Garcias faith in many places in the Indies where it is of great use the last Appendichte faw in the garden of a Turke in Cayro which was brought out of Ethiopia. The Time.

Their times of flowring and fructifying are according to the countries where they grow, some eatier and others later.

The Names.

The Greeke name Nikus Lycium (and mogangivan Pyxacantha) is imposed on the dryed juice as well as on the bush, so called as it is thought because it was brought out of Lycia and Cappadocia, and was of much use in former times but not of later dayes, because what was brought was well knowne and perceived to be countries, being made of the berries of Privet or of the Honysuckle or Doggeberry fruite or of the mall together, and had note of the notes of the true Lycium which are these; It is blackish on the outside of the whole cakes or peters, but being broken of a brownish vellow colour within, and quickly growing blacke a aine having no virulent feet. but of a bitter tafte astringent withall : the Indian kinde which is the best will have a Saffron like tolour, and this especiall note the true and best will have, that being put into the fire it will burne and slame, and being quenched it will give a reddish (scumme say some and others a reddish) sume or smoake: but that sophisticate or adulterate Lycium which of late dayes hath beene used hath none of these true properties in it: and Diosemids and Galen doe both shew that there wanted not impostoris in their time, to counterfeit the true, and would mixe America that is, the Grounds or Lees of oyle with it to make it burne, and with the juice of Wormewood or the Gall of an Oxe to make it bitter, and as Galen faith they did to cunningly counterfeit it that it was hard to know the falle from the true. The first as the most frequent is thought by divers and Lugdunensis standeth mainly for itto be the right, notwithstanding that Anguilara faith it is not the right Lycium although it be to taken by divers Matthiolus & Tabermontanus call it Lycium, & Lugdunensis, Lycium Alpinum, Dodonaus, and Lonicerus Fyxuaniba, Lobel in Adversarys setteth forth a Lycsun five Pyxacantha Narbonensin, which it may be is this, Baubinin callethic Lycium Buxifolio: the (econd Matthiolus, Lugdunenfis and Tabermontanus call Lycium Italicum, Pona shewith in his description of Mons Baldus that it is the same that Cinfins calleth Spina infestoria pumila altera, and Bunion Lycium facie Pruni sylvestrie sive Italicum: the third Clusium calleth Lycium quorundum, and faith the Spaniete where it grew call it Tamujos and Tamuexos, and thereof make Broomes and heate their Ovens and Kills, &c. but Lugaunenfis is much mistaken in thinking this of Clusius to be the same that Lobel in his Appendix tohis Obfervations calleth Lycium Hispanicum, which is my fourth fort here, and hath longer & narrower leaves then that of Clusius which hath rounder leaves more like Box and Bankings observing well the differences callet the one Lycium Hispanicum folio buxi, and the other Lycium Hispanicum folio oblongo: the fift Lobel in Adversary calleth Paliurus alter peregrimus, but hath miltaken the figure thereof in his Icones putting the figure of Pyracantha (that is of Oyacantha Dioscoridis which as he faith hath an ever greene leafe, and is not the Barbary as divers do millakeit) for it, which he fetteth downe in his Adversaria, but in his Icones the faid figure of Pyracaniba is put under both the title of Paliurm alter peregrinus and of Rhamnus tertius Dioscoridis also, Banhinus not taking it to be any species of Paliurus calleth it Lycium latifolium : the fixt Lugdunenfit faith Dalechampius tooke to be a Lycium her three fore calleth it Lycium Dalechampy, and withall faith that some called it Tinetorium granum, that is in Fruth Graine a teindre and others call it Graine jaulne and some Graine d' Avignon ; Baubinus calleth it Lycium Gallium and may be called Granum Avenionenfe: the feventh Honorism Bellum of Candy faith it is there called Anthe Lantzia of the inhabitants, but he himselfe calleth it Lycium, yet saith also because it is not the right Lycium, it may be called Berberis Alpina aut montana, for Silverius 7 odeschius reported unto him that he sound the very fame very frequent on Mount Lybanse in Syria, Pona followeth Belles in his Italian Baldes, and callethit by the fame names, Baubinus referreth it rather to the Barbery, making it another species thereof and not of Lycium: the eighth as Bellus saith is also another fort of Lycium, and called by the Candiots has not Largeri, and more with the saith is also another fort of Lycium, and called by the Candiots has not Largeri, and more with the saith is puy sala Petroamygdala hoc off petras amygdala, but yet hath no refemblance to our Almond tree : the night is called of Clusius Lycium legisimum Rauwolfis, and by Rauwolfiss himselfe Frutex spinosus peregrims Aralibus Hadhadh, incolis Zaroa, Bauhinsus Lycisum Indicum folis prumis the tenth is by Profeer Alpinm called Lycisus Indicum folis prumis the tenth is by Profeer Alpinm called Lycisus Indicum secretary, and faith it is called V/eg by the Egyptians: Bauhinsus calleth it Lycisus Indicum alternus: the eleventh is called by Garcias Cate five Lyciam, and faith the true is called Hattych, which thereupon I have initialed Lyciam Indicum putatum Garcia, and by Banbinus Lytium folige Erica: the last Alpinus faith is called by the Egypians Agiabalid and may not unfitly be accounted a Lycium, Banhinus thereupon calleth it Lycis affinis Egyptica.

The Vertues,

The condensate juice of Lycium is that that onely is to beeused, of all the parts of the tree, which was made as The concentrate plane of the leaves and berries, but Pliny faith of the roote and branches, which being steeped Designation water was afterwards boyled and firayned, & then evoporated untill it came to the thickness of homedican water was anterwated boyieu and itrayned, or then evoporated until it came to the thickness of ho-mal loobe kept as a liquid medicine as Galen feemeth to intimate, or elle dryed up to the thickness of Opinns admedium in that manner into Cakes, which as is sayd were to be broken to know the goodnesse: the scumme be bijected taken away in the boyling is put with other medicines that serve for the eyes, the rest is put to deales, yet the Lycium it felfe is also fet downe by him, to be effectuall to take away the dimnesse and filmes offense, it flageth Fluxes of all forts both of the belly and humours, as the Laske and Bloody flux. be undance of Womens courses, and the whites, bleedings at the mouth or nose and splitting of blood: it is splitting of all sowie and creeping Cankers, Vicers and sores, whether in the mouth throat or other parts of the boly, as also for the loofenesse of the gummes, chappes in the lippes or clefts in the fundament, and at the the mayles of the hands: but especially for all fores in the privile parts of man or woman: it is good for being taken with water, as also against the bitings of a mad Dogge: being put into the eares that mer industrict, it helpeth them: it is good also against the itch and scabbes, and to clease the skinne: it colou-mbde theire yellow, and give the a yellow dye not onely to Leather and skinnes, but serveth Dyers also and Painters in their workes.

CHAP. XXV.

Rubus, The Bramble.

Let of Fthe Brambles there are are divers forts, fome having thornes of prickles upon them, others few or none, some growing higher and lower then others, some also carefully nursed up in Gardens which are the Raspies berries of divers forts, whereof I have in my former Booke given you the knowledge sufficiently and shall not be here againe described.

1. Rubus vulgaris major. The common Bramble Blacke berry buth.
The common Bramble or Blacke berry buth is so well knowne that it needeth no description, every one that

halifeneit being able to fay that it shooteth forth many very long ribbed or straked branches, which although a gestanthereof standers upright, yet by reason of the length and weakeneffe they bend againe downe to the ground, there may time taking roote againe, all of them thicke fet with short and trooked thornes, and leaves likewife at feverall places upmlong prickly footestalkes, three and sometimes five fet togethen, hard and as it were crumpled with small prickes on the middeunder rib, of a darke greene colour and grayish undermah, which feldome fall away all the winter untill all the sharpe trousbepart (whereby the countrey men doe observe that the turnity of Winter is past when they fall off) and that new lere shortly after beginne to shoot forth againe: the flowers remany fet together at the ends of the branches, which confift of the whitish leaves like those of the wilde Bryer bush, and formines dasht with a little Carnation, with small threads in the middle, after which come the fruit every one by it felfe, ha confissing of many graines or Berries as it were set together around head like a Mulberry, greene at the first, reddish afterwad, and blacke and sweete when they are ripe, which ele are harsh and unpleasant : the roote groweth great and

2. Rubin minor Chamerubus five Humirubus.

The finall low or ground Bramble. The branches hereof are very flender, alwayes lying and trayinguponthe ground, never rayling it felie up as the former doth, and often rooteth as it creepeth, fet with crooked thornes, but much smaller then the other, & with the like leaves and flowers of a rale Rose colour, and berries but smaller, and of a blewish bake colour when they are ripe like unto a Damson, and as feere as the other Blaccke berry almost, but with leffer sappe a mice in then : the roote here of creepeth about, and from the hony joynus fend forth new branches. Of this kinde there is

3. Rubus montanus odoratus

Sweet mountaine Bramble or Raspis. The mountaine Bramble or Raspis (for to eyther it may bee mored) hath fundry long stalkes rifing from the roote without

thomes on them, but fet thicke with foft haires, from whence shoot forth the broad and large leaves without the interpolation long hairy footestalkes divided into five parts almost to the middle ribbe, and sometimes but into the or more, each a little denied about the edges of a very sweet sent but falling away in winter: the flowers are becapital large like the Eglantine of a delayed purplish violet colour, with divers yellow threads in the middle . Standing

6. Chamemorus Anglica.
Our Knot berrie.

The welfh Knot berry or Laneaghiere Cloud berry

index at the toppes of the branches; after which come the fruit very like unto Bramble berries bur reddiffs as index in the roote (preadeth much about under ground,

A. Rushus tricecous. The Deaw berry or Winberry.

The Deaw berry hath flender weaks branches like the last more often lying downe then being raised up with fempickes and shornes thereonythesk in the last, the leaves likewise are usually but three set together more segments branches, yet almost six rays as it and nearer set together on long stoothalkest the flowers are white present of the berries usually confishing but of three small berries or graines set together in one, yet many times as such that the less set of the set of the less set of the set of the less set of the less set of the set of the less set of the last.

This fall to plant which by Classes is more fiely referred to the Raspischen the Bramble hath divers stender redshivingly hairy branches little more than a foote high, without any thorne at all on them, see here and the minore field research to the Raspischen the Bramble hath divers stended redshivingly hairy branches little more then a foote high, without any thorne at all on them, see here and the minore plant is the flowers than at the coppes of the branches three or four together consisting of foure selone of five leaves a peece, of a pale or whitish Rose colour which afterwards turne into small fruit, composite the four or five graines or berries set together greater then eyther in the Raspis or Bramble of a reddish olds when they are ripe, almost transparent, full of a most pleasant sweete and acid juice gratefull to the palate, have in each of them a white rough kernell or stone: the roote creepeth all about and shooteth forth sindry branch som the joynts as they ereepe.

6. Chamamorus Anglica. Our Knotberry.

The Lootherry rifeth up with flender brownish flashs not a foot high fiet with source or five large leaves one above mother a severall winged joynts, each of them divided into five parts, and each of them somewhat deepely juged and dented also round about the edges, rough and as it were crumpled each upon a long sootsfalke, which ark joynts have two small peeces like eares fet thereat; each stalke being similated at the top with one flower maked five round pointed leaves of a darke purple colour, after which followeth a large herry like unto a Mulemyddivers graines set together, of a reddish colour when it is ripe and of a sowrish sweet taste, the roote corpulation and faire shooting forch small sibres at the knotty joynts whereby it is fastned in the ground and fainteed divers new shoots for stalkes.

7. Chamemorus Cambro-Britanica five Lancastrense Vaccinium nubis.
The Weish Knotberry or Lancastire Cloud berry.

This small and low Bramble that scarse appeareth above the ground mosse among which and the blacke berried Heath, it. it groweth hath small creeping rootes running under ground, and shooting forth here and there faire large terms almost round a little divided as it were into five parts, and a little unevenly dented about the edges, being somewhat rough and full of veines of a darke greene colour on the upper side and paler underneath, as also somessened with two or three the like but lesser leaves on them, and at the toppe a purplish small sold like slower which changeth into a Raspis-like fruit, in some smaller in others greater consisting of sundry being strongether. Sometimes more and sometimes lesser, of a pale reddish Orenge colour tasting reasonable wellshough not so good as a Raspis.

8. Chamemorus Norwegica. The Knotberry of Norweg.

This Knotberry of Norweg is very like unto our first Knotberry, having many sender brownish twigges risease much bove a foote high, whereon are set divers broad leaves upon long sootsalkes more round then the sandparted into three or more short divisions, each snipped or dented about the edges, and having 3, great ribs when the side with divers small veines from them to the edges: from the toppes of the stalkes rise divers flowers each upon a long footsalke composed of five white leaves for the most part, with divers white threads the which follow the fruite, of the bignesse of a Strawberry, some reddish and when more pale, of a solution of the stalkes rise somewhat clammy, yet not unpleasant with small kernells therein.

9. Chamemorus Norwegica altera. Another Norway berry.

lhelikenesse of the small bush unto the last which are very like unto those of the Riles or red Granthath caused the name to be joyned thereunto, the stalkes are of a like shortnesse, of a blackish colour whose histernatoroad, and curin somewhat more deepely into sundry parts, the berries stand at the toppes of the histernany clustering together as it were in a tust every one upon a short stalke, red when they are ripe and sozwhat tart in taste.

The Place.

Ikefilis frequent every where: the second groweth sometimes by woods and hedge sides and sometimes intended of fields in many places in this Kingdome, the third groweth on the hills and higher grounds; the surhis well knowne in the North parts of this land, as Chessive, Lancashire, & Torkessive: the site in story and rocky place, both in the Heof Thanes and other places of Kens, as also in Huntingson and Northampsonshire; the sixt sowth on the high hills in Lancashire and Torkessive, the one called Ingleborough the other Pendle the two high-dhills in England; the seventh was first made knowne unto us by Thomas Has kee a paineful Chiturgion and Simple of Lancashire, who gave us a rude draught thereof, but Doctor Label going both into Wales and the Shires was thereunto sound it there growing, and on Ingleborough hill in Lancashire, as Mr. Bradsangh a Gentleman of the Countrydid likewise and sent it up to us, where the people call the fruit cloud berry, because the hill

timeth as it were continually covered with clouds and the two last are declared by their titles to grow naturally The Time.

The Time.

The Charles or beginning of September.

The Names.

The Bramble is called in Greeke Barte Batten, the Latines call it Rubus and Sentis. Theophraftus hath three forts but hather, Chamebates Humilia rubus, or Humirubus and Cynosbates Rubus caninus or Canis rubus. Pliny hath attalobatin a different manner : the two first forts of Theophastus are generally knowne of all, but of the butter is some controversie, for Tragus maketh the Spina appendix or Oxyacanibus our white thorneor Hawantee to be Cynosbates, and so doth Dodoness also. Cordus, Lacuna, Mercanus and others thinke the Rosa

to Refe Demostra

1. Rofa fitnefirk inedera frue Canina.
The ordinary wilde Bryer buff.

Camina or Sylvestric to bee it, Pliny as I thinke being the author of that opinion 1. 14 c. 13. where he had the Camina or Sylvestric to bee it, Fisny as I thinks being the sanitor of the Dieseries growing in heigh with the another kinds of Rubus whereon a Rose groweth called Gross batas by Dieseries growing in heigh with the Brambles; againe Fliny lib.; 6.cap. 47. faith thus, Rubi Mora ferunt & in allegiare finitediams Ref. on the library of hour a least like times a sanitor of hour a least like times as Brambles againe Pliny 46.16.cap. 27. 12111 10115, and 1221 a leafe like unto a mans footeler, but in lib. 15.cap. 2, hee describeth Cynobatos to have a leafe like unto a mans footeler, but in lib. 15.cap. 2, hee describeth Cynobatos to have a leafe like unto a mans footeler, but in lib. 15.cap. 2, hee describeth Cynobatos to have a leafe like unto a mans footeler, but in lib. 15.cap. 2, hee describeth Cynobatos to have a leafe like unto a mans footeler, but in lib. 15.cap. 2, hee describeth Cynobatos to have a leafe like unto a mans footeler, but in lib. 15.cap. 2, hee describeth Cynobatos to have a leafe like unto a mans footeler. Cynolbator, but in 110, 1 5, cap. 2, free described spreament of state whereof it was called Name ablacke fruit or Grape, in whose kernell there is a nerve or snew whereof it was called Name all the state of the s a blacke fruit or Grape, in whose kernell there is a nerve or innew wintreor it was carred tremposite; but Manthotic tontradicteth them and shewesh that P liny in setting downe the wilde Roses called one by a realize name Cynorhodos Rosa Canina and not Cynoshotos Canina and not Cynoshotos and the description of Dioscorides (sinh be) like, eth he meant no fort of Rose for else it had beene easie for him to have said Cynoshotos is like a wide Rose, but the fruit to he like Olive stones wherein lyeth dominant. eth he meant no fort of Kole for each time occase control to the like Olive flones wherein lyeth down burnilla he comparest the leaves to myrtie leaves, and the mind to be and the line of the state of the st the windpipe by fricking thereto irit monders at mine, our fact the belly. Theoperafter lib 3.cap. 18, faith but faith the fruit being dryed and drunke in wine doth bind the belly. Theoperafter lib 3.cap. 18, faith below. but faith the fruit being dryed and a take in while dott office the state of Agum caffur: Strapic fresheld Const beareth areddith fruit like unto a romegation, site a test including as he faith that Cympathos Caninus Rubus among the other forts of Brambles, whereby it is plaine as he faith that Cympathos the wife or dogge Rose doth much differ from Cynoshatos the dogge Bramble, and yet Lugdanessis in contraying Mantholus in reasons strives by finding fault with the text both of Dioscorides and Theophrassis and amending them. as he thinketh fit, to reconcile them and make the Cynofbates to be the wilde or Sweet Bryer but very fomly in my opinion. There is little variation of names among writers concerning the two first, but of the third and fourth I doe not finde that any hath written being bufnes more peculiar to this Land then others defin and routed a doction that the same than any the same five Alpines. Gefree in bortis calleth it Rubus Alpines humili, Then Rubus minimus and Baubinus Chamerubus faxatilis : the fixt and the two last are mentioned by Classic to the names of Chamamorus Anglica, Norwegica altera as they are in their titles : the feventh hath a name or titles names of Chamemoras Auguca, Norwegicaaitera as they are in their three the leventh hair a name or niegi. wen it as is fittest to expresse it, and to put all out of doubt concerning Gerards Cloud berry as see both expedit it from the rude draught of Master Holkets doing as it is very likely, but the more exact figure is her chibred. The Arabians call the Bramble Buleich and Haleicho, the Italians Rovo, the Spaniards, Carca (fars) she Fract Rouce, the Germans Brombeer Bremen and Bramen Bramen also, and wee in English Bramble or Blacksbury. bush the fruit or betries are called in Greeke garnes as Galen faith which some have made Patins in Latine, Me. rarubi, but in the Apothecaries shoppes Mora bati, and of some Mora buff, the berries of the Mulberry trebeing called by them Mora felfi. The Vertues.

Galen lib. 6. simpl.med. faith that the buddes, leaves, flowers, fruit and roote of the Bramble are all of a great binding quality but yet somewhat in a differing manner, for the buddes, leaves and branches whilethey are fresh and greene have a cold earthly quality joyned with a warme watery suostance, but little binding and therefore they are then of good use in the Vicers and putride fores of the mouth and throate, and for the Quinfe, and likewise to heale other fresh wounds and sores but the fruit when it is ripe because it is sweet bath a temperate Warming juice therein, whereby and by that finall aftriction is in it it is not unpleafant to be caten, but being not vet ripe it is of an exceeding cold and earthly substance, sower and very astringent, and being kept doe more strongly bind then when they are fresh: the flowers are of the same propertie that the unripe fruit is of, both of them are very prositable for the Blooddy flux, Laskes and the weakenesse of the parts comming thereby, and is also a fit remedy against the spitting of blood : the roote also beside the binding quality therein hath a thinness sence whereby it is available, eyther the decoction or the powder taken to breake and drive forth gravell this the Stone in the Reynes and Kidneyes: the leaves of Brambles as well greene as dry are excellent good for lotions, for the fores in the mouth and fecret parts : the decoction of them and of the branches when they are dred doe binde the belly much more, and is good for women when their conries come downe too abundantly the betries faith Pliny or the flowers are a powerfull remedy against the most violent poyson of the Preser or Diplas (which are most violent Serpents) the Scorpion and other venemous Serpents, as well drunke as outwardly applied, and helpeth also the fores of the fundament, and the painefull and bleeding Piles: the juice of the beries hereof mixed with that of Mulberries maketh the medicine more effectuall to bind and to helpe frenting or enting fores and Vicers where foever, and is good for the stomacke, the fores in the mouth with the loofeness of the gummes and teeth: the same being taken alone or mixed with some Hipocistis and Hony saith Pliny is a remedy for choller when it gnaweth the stomacke which some call hartburning, and is good also against the pessions of the heart and faintings : the distilled water of the branches leaves and flow rs, or of the fruit is as sweetes that of Violets, and is very effectuall besides the facilitie and pleasantmesse in taking, in all hot severs or distemperathrees of heate in the body, the head, eyes, and other parts, and for all the purpoles aforesaid: the leaves of Brambles boyled in lye and the head washed therewith doth heale the itch, the mattering and running fores thereof, and maketh the haire blacke a the powder of the leaves firewed on cancrous and running Vicers doth wooderderfully helpe to heale them. Some use to condensate the juice of the leaves and some the juice of the bennes to keepe for their use all the yeare for the purposes aforesaid : the other forts are very neare in qualitie monit and therefore worke the fame effects no doubt : but the Norway Knotberry is much commended against the Scorbute or Scurvey, and other crude putrid and me lancholy diseases wherewith those Northerly people are much afflicted, which Clusim out of Hierm Epittle declareth at large, and the manner of the cureof a number infected therewith as well in Winter as in Sommer, whereunto I refer them that would understand it more fully.

CHAP. XXVI.

Rosassivestres. Wilde Roses or Bryer bushes.

1. Refassives insedera five Canina. The ordinary wilde Bryer bush.

It wilde Bryer bush growest of it selfe in the hedges very high, with upright hard wooddy stemmes coverable in graying bush estimates the other topes that not so thicke as this graying divers leaves somewhat larger thereon and not so greene on the upperfide nor so gray-bushness has the other, the middle ribbe whereof hath divers small crooked thornes and without any sent will be sowers stand at the toppes of the branches divers set together, of a whitish blush colour, made of five manipulated leaves somewhat longer then the Sweet bryer or Eglantine Rose. Standing in such like buskes as branches Roses doe; after the flowers are past come the string sand rounds; of a yellowish red with or reddish yellow colour when it is ripe, having a soft sweetish pulpe under the skinne, and seedes lying bushes is the which berries are much devoured by the poorer fort of women and children that care them gladly a bushes here and farre in the ground growing somewhat great. Ypon this Rose as well as upon the Roseaum special five somewhat deepe and farre in the ground growing somewhat great. Ypon this Rose as well as upon the Roseaum special five specials did not not a burre or ball of browne threads, and I have often seen it also upon the greater. Apple Pinta Bushes in the growing somewhat great in the growing specials.

2. Refatyluestris adorate carnee flore. The wilde blush Bryer Role.

This wild Bryer Role is so like the former that it is hardly discerted from its eacher for the height of the stem which of thomes or smalless of the leaves but onely for the slowers which are somewhat larger; and of a smalless or purple colour somewhat sweet withall.

Divide the property of the pro

le monta Bryer Rose hath divers as greaf Remmes and branches as any other Rose which ever are greene when grayth, the with many small prickes and a few great thornes among them the leaves are very small and almost round, many set on a middle ribbe one against anothing somewhat like unto the round of the standar the toppes of the branches consisting of five small leaves, of a pale when the standar the toppes of the sweet brier, which fall swely quickly as they and made.

5. Rosa compessive flore also odore. The fingle sweete white Rose.

The final sweete white Rose.

The fingle sweete white Rose.

The final sweete white Rose

5. Mofa Campeferu flere also odoro.
The lingle livecte wilde Rofe.

6. Ryle Port Andrews

8. Roja Pimpinella fice Portifera miny. The until Butter Kufe of Pimpernell Role

10. Refa furplex panils for fies.
The fingle dwarfe Role withour thom

many inother Roles, but are blacke when they are ripe and not red, with white feedes lying in flockes

6. Rola street in Anstriaca store phenices. The Vermillion Rose of Anstria.

16 Permillion Rose of this Rose are stender and reddish, the elder brownish gray, set with divers thorness are the street of the state of the street of the street

7. Roja passila rabra Austriaca. The fingle dwarfe red Rose of Austria.

This work Rose groweth not much above halfe a yard high, with stender greene stemmes, set with few one about below, but stimulised up higher with many, having whitish greene leaves upon them like the ordinal problem grayish understeath five or seven set to get upon a stake toppes of the branches come and enginest bearded husles, whethen stand large slowers made of five leaves a peece, somewhat sweet, red as the sed decaying with standing, growing much more pale before they fall away, with yellow threads in a public, since which come the frair which are red as the others but greater then any of those before declared, what sweet same has a peace then others.

8. Refa Pimpinella five Pomifera minor. The small Burnet Rose or Pimpinell Rose

This stall Rose feldome riseth above a foote high being of two sorts, whereof the one hath but few thornes on
the this, and the other full of small thornes (both which are oftentimes found in one ground, but the thorney
are sequity) for with long winged stalkes of leaves, being many small round greenish leaves for one against
setting the stalke shely dented about the edges, seeming like unto a Burnet leafe for the forme and numto strictly the stalkes are single small and white without any sent, after which come small round heads
white when they are ripe full of seede as in other Roses.

9. Refa pamila campefiria alba. The Dwarfe fingle white Role. This one of the malleft Roles fearle rising a foote above ground, being fet with small thornes and leaves according to proportion of the plant and the wildnesse of the kind; the flowers are white and small giving being sleet like the rest; the roote except about more then others.

10. Rola implex pumils like fins. The fingle Dwarfe Rose without thornes.

This Dwarfe Rose also groweth very low, even almost upon the ground with greene stalkes without any then thereon, set with small winged leaves, so small that they seeme scarse to be leaves of a Rose: the flower is milled of a pale reddish colour and single, in some places very sweete, and in others little or nothing, flowring also interplaces both in the Spring and Autumne.

The Place.

The two first grow in the hedges of our Land every where almost, yet the second not so frequent as the first: the histome from Musses : the fourth from Uirginia: the fift from Germany in fundry places: the fixt and sembled must find a white it the eight is found in divers places of our owne Land both in barren heathy grounds, and by work and hedges sides: the ninth on some of the hills among the Switzers, and the last neare unto Lyous in haceopon Pilass hill there.

The Time.

Smeofthele Roles flower earlier then others, for some come in May others not untill Inne when other lesses.

The Names The Rolein called in Greeke 560 or Rhodon quod largum odorio efflaquam emistat, from the great (weetneffe theresullmant faith, in Latine Rofa; Theophrafine and Pliny have very diligently observed the severall differenmateriferies in their times, Theophrastus in generall termes and in the number of the leaves, some few some my, is the thernes in the colour and fent, and Pliny by feverall names, yet not expressing all their colours, ministrations formerly have appropriated to those Roses were extant with them : but if I shall undertake kalem their correspondencie with ours herein, as I shall endeavour in declaring my opinion to shewthe little and agree with them in some of them, so I shall (how free from errour I leave to others to scanne) stimutem in others; but first because I intend to make Pling my author to comment upon I thinke it firinterpolate exist of Plany in order as it lyeth lib, 21.cap. 4. The Romans (faith he)have in greatest account the hardinand Campana, fome have added into them the Milesa which hath the reddest colour not exceeding a larger text hereunto is the Trachynia not so red, then the Alabandica more vile or of lesse esteems with the manest (vilifima sed at alij legant will slima) with yery many but very small; even the small that the manest (vilifima sed at alij legant will slima) with yery many but very small; even the small that the same will slima sed at alight so we have the small that the same will slima sed at alight same will slima. the incanest true incanest (virifima fea are asy segma missignma) with very many out. Very many to the state of the control of the state of the faith there is also one that we called the state of the in the Olive tree, called Mojebenton, among these is that which beareth in Autumne of a middle fize, defined; all are without fent fave the Coronela and that which groweth on a Bramble, Thus farre Pliny, which ge bow aprly other authors have fitted the Roles of these times unto those of Pliny, and first for the a private of a private authors have fitted the Roles of thele times unto thole of Play, and first for the image generally taken to be our Damaske Role, yet Luganensis sixth is the red Role, among which is the private of the last the property of the property of the property of the last the last the property of the last the the published colour and fent best when it is dryed, whereof as hee shirthere is both single and doubles the colour Velnet Rose to be it; first because the colour is deepe though the sent be small, and it rever expenses the colour is deepe though the sent be small, and it rever expenses the colour is deepe though the sent be small, and it rever expenses the colour is deepe though the sent best and the sen the states. The Trachysis is our pale red Rofe which Lugdeners is faith the French call Rofe incarin Commercial in horse faith it is a purple Rofe of a deepe or blackish red colour with a pale violet colour with some German, he faith tall it Kelresen, and differeth little from the Milesia but that it is greain tardy to deepe aved colour as Camerarin aborrerh unto it cannot agree unto Pliny his Trachynia which hand riber of a paler red colour, and therefore I thinke it is the worfer fort of our red Refer whose

colous common faste thort or that energy on the tracketh it to be the Rofa Canina (but Lugdamenfi fasteth by white

tish leaves and of lesse esteeme Camerarius taketh it to be the keja Cansus (Dut Luganumijis sheweth the with auncients the Alabandica Sphreela and Cantifolia were accounted to be flowers the thickest of leaves) and mybe agree unto the similar white Rose as I thinke the Banbium referreth is to the Roja of flowers and mybe agree unto the similar white Rose, but this Rose is not of so small esteeme as Pliny faith the Alabandica in The Phintour and the Alabandica in The Phintour Canada in Spinas and the Phintour Canada in the Phintour Canada in the Phintour Canada in the Alabandica in The Phintour Canada in Spinas and Canada in the Phintour Canada in the Phinto

Spincol a or an others have it Spincola, but Ffermolans Barbarus thinketh it should be rather Spranged. The merarine saithochers did thinke it should be read Special, but Bankinan hath Speibica is the Cinama.

double Cinamon Rofe, which be faith was usually called with them Venerate of of others Previncial principles.

TRIBLO

Total upon Disserties mentioneth in the first Booke and 24. Chapter, Cynosbatos and Cynorrhodos, being his midden, laying it is the least and may be called Chamerbodos and is called by the Germanes Erdrosen, Banbinus didicts, saying after is repens alba: the last is taken by Lugdunensis to bee Rosa Graca sive Lychnia Gracorum chair Rosa compession are ir man felli as to find the contract of the contract clean Roja composition of the called Cynorrhodon lang, Banhinus calleth it Roja campestrie The main bifore. A Lecture of much moralitie might be read upon the Role, the parts delivered by many aumount of the parts delivered by many authorities all which to infert in this place is not my minde, onely I will recke a few of maboth Greeks and the plenty and excellencie.

To Rosamane viget, tamen o mox vespere languat,

Sic modo qui fumim, cras levis umbra fumus. And againe. Vidi evo mane Rofam folis cum lumine nafci. Et vidi rur [um fole cadente mors.

femilierably infatuated Turkes will not fuffer a Role leafe to lye upon the ground, or any to tread on them honor of their Mahomet, from whose sweat they are perswaded the Rose sprangup; somewhat like unto the Mingans, who held the Rose which formerly was white to become red from the blood of Venus, falling thereon from the foote hurt by a thorne, as thee ran among the bushes to helpe her Adonia. Philostraus dedicateth the Bein Capid whom it doth represent in every part. It is fresh young and delicate as Capid, it is crowned with gold reliow haires, it beareth thornes as darts and leaves as wings, the Crimson beauty of the slowers as his glogarpinous manner, a treatment of the spring state of love, the lightning of the Land.

Anacreon his Greeke vertex, the fairchushie toppe of the spring, the fire of love, the lightning of the Land. felimed by Stephanus are fufficiently knowne being thefe,

Rosein puer Cytharia. Rola bonos decusque florum : Rola aura, amorque veris: Caput implicat coronis Rola celitus est voluptas. Charitum choros frequentans

The Vertues Beaufe I have spoken so much of the manured Roses in shewing their denominations. I thinke it not imperment also before I entreate of the qualities of the wild forts, to set downe the properties and vertues of the Grinkinds somewhat more amply then I have delivered them in my former book. Both the white and the red Reference cooling and drying, yet the white is taken to exceed the red in both those properties, but is seldome. sedinwardly in any medicine : the red as Galen faith hath a watery fubstance in it, and a warme joyned with 1800 other qualities, that is, an aftringent and a bitter : the flowers thereof (which wee call the feedes, but rather. the reliew threads in the middle) doe binde more then the Rose it selfe and more drying also. Mesues sheweth hate Rofe is cold in the first degree and dry in the second, compounded of divers parts or substances which pumple separated, namely a watery meane substance and an earthly drying, an ayrie substance likewise sweet and aromaticall, and an hot also, whereof commeth the bitternelle, the rednelle, perfection and forme, and yet before of the heate is stronger, which hath caused the forme and rednesse then that which causeth the bitterreferring dryed that bitternesse vanisheth when the other two doe abide the bitternesse therefore in the Robinsher are field, especially the juice purgeth choller and watery humours (which qualitie the Greeke. authorn it feemeth knew not) but being dryed and that heate that caused the bitternesse, being consumed the being the being to be the state of the being to be the being to be the state of the being to be the state of the being to be the being to be the state of the being to be t marthen those that are full blowne and the white Roses more then the red. The decoction of red Roses made with wine and used is very good for the head-ache and paines in the eyes eares throate and gums, the fundament the lower bowels and the matrix being bathed or put into them: the same decoction with the Roses remaiing in them is profitably applyed to the region of the heart to eafe the inflammations therein, as allo Saint Anthe infree and all other difeases of the stomacke : being dryed and beaten to powder and taken in steeled wine wwater doe helpe to flay womens courfes, they ferve also for the eyes being mixed with such other medicines the ferve for that purpose, and are sometimes put into those compositions that are called Anthera as is before id. The yellow threads in the middle of the red R ofes especially (which as I said bee erroniously called the latefeedes) being powdered and drunke in the distilled water of Quinses, stayeth the aboundance of womens contes, and doth wonderfully flay and helpe the defluxions of rheume upon the gummes and teeth, and preferminimum from corruption, and fastneth them being loose if they bee washed and gargled therewith, and some integr of Squilles added thereto: the heads with feed being used in powder or in a decoction stayeth the Laske mite spitting of blood. Red Roses doe strengthen the heart, the Stomacke and Liver, and the retentive samiss: they mitigate the paines that arise of heate, asswage inflammations procure sleepe and rest, slay womassonries both white and red and the Gonorrhea the running of the reines and the fluxes of the belly : the juice often doth purge and clense the body from choller and flegme : the huskes of the Roses with the beards and the althoughe Rofes are binding and cooling and the distilled water of eyther of them is good for the heate and thefien the eyes, to stay and dry up the rheumes and watering of them. Of the red Roses are usually made compositions all serving to sundry good uses which are these. Electuary of Roses, Conserve both moist with which is more ufully called Sugar of Rofes, Syrupe of dryed Rofes and Hony of Rofes: the cordiall with a result of Rofes of Rofes, Syrupe of Rofes and Hony of Rofes, Vinegar of Rofes, ointand oyle of Roles : and the Role leaves dryed which although no composition, yet is of very great use and the belast of all spoken. To entreate of them all exactly I doe not entend for so a pretty volume of it selfe the composed, I will therfore only give you a hint of every one of them, and referre the more ample declarafind them to those that would entreat onely of them. The Electuary is purging, whereof two or three drams of the them in some convenient liquor, is a competent purgation for any of weake conditution, but may be smalled unto six drammes, according to the qualitie and strength of the patient; this purgeth choller without is made. moble, and is good in hot Fevers, in paines of the head ariling, from hot and chollericke humors and heare alleges, the laundies also and joynt aches proceeding from hot humors. The moyst conserve is of much use whiting and cordiall, for untill it be about two years old it is more binding then cordiall, but afterwards it is mential then binding fome of the yonger conferve taken with Mithridatum mixed together is good for those that mobiled with the diffillations of rheume from the braine into the noie, and defluxions of rheume into the

eyes, as also for nuxes and Laskes of the benry, and being that with the last per confirme for the running of the reines, and for other loofenesse of humors in the body: The old conferve mind the for the running of the reines, and for other notice in the rest of the running of the reines, and for the running of the reines, and for the running of the reines, and reines of the running of the reines of the running of the runni Diarrhodon Abbatu or Aromaticum rojarum 15 a very guou cordian against annual actions and stremblings of the heart, it strengthneth also both them and a weake stomacke, kelpeth digestion, they are the day Conserve which is a larger to the day Conserve which is a larger to the day. and tremblings of the heart, it ttrengtimeth and both them and a week to conferve which is called significant and is a very good prefervative in the time of infection. The dry Conferve which is called significant and the called significa Roles is a very good Cordiall to ftrengthen the heart and spirits, as also to stay defluxions. The Sympe of the

Roles is a very good Cordian to utengetien the heart and spirits, as and to the property red Roles strengthneth a relaxed stomacke given to casting, cooleth an overheated Liver and the blood in Again and helperh to stay I askes and smeath a relaxed stomacked in a set of the I askes and smeath a relaxed stomacked in the stay I asked a relaxed stomacked a relaxed stomacked in the stay I asked a relaxed stomacked in the stay I asked a relaxed stomacked a relaxed stomacked st red Roles threngthnern a relaxed monache given to catching, cooled to fixy Laskes and fluxer. Hong

Roles is much used in gargles and lotions to wash force either in the mouth, throate, or other part, both Roles is much used in gargies and focusing to want, follow cyclic in the hindering their heating, its used along elense and heale them, and stay the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the fluxes of humors falling upon them hindering their heating, its used along the humors falling upon them hindering the humors falling upon them hindering the humors falling upon the humors

elenic and heare them, and may the made of human along upon the hard and a from the sound along glitters both to coole and clenic. The cordiall powders called Distribution and a from the sound the

guiters both to coole and ciente. The cordinar powders and appetite, helpeth digettion, flayethesting, and a counfort and ftrengthen the heart and ftomacke, procureth an appetite, helpeth digettion, flayethesting, and a

very good for those that have slippery bowels to strengthen and confirme them, and to confirme and type the

grouture and slipperinesse. Red Rose water is well knowne and of familiar use in all occasions about the fact and of better use then Damaske Rose water, being cooling and cordiall, refreshing and quickning the western

of better the then Damaske Rose water, being cooling and coloring, activating and questing the watered faint spirits, either used in meates or brothes, to wash the temples or to smell unto at the note, or the block of the cool of the

fweete vapours thereof out of a perfuming por, or caft on a hot fireshovell, it is also of muchuse against mend-

nesses and inflammations in the eyes to bathe them therewith, and the temples of the head also against paice and ache therein : Vinegar of Roses is of much use also for the same purposes of paine and ache, and disquittes in

the head, as also to procure rest and sleepe, if some thereof and Rosewater together be used to smell into, or the nose and temples most ned therewith, but more usually to mossten a peece of a red Rose cake cut fit for the propose, and heated betweene a double foulded cloth with a little beaten Nutmeg and Poppy seede, shrwed on that fide shall lye next the forehead and temples, and so bound thereto for all night. The oyntment of Ross much used against heate and inflammations in the head to annoint the forehead and temples and being mixed with tome

Papuleon to procure rest, as also it is used for the heate of the Liver, of the backe and reines, and to coole and brile

pushes wheales and other red pimples rising in the face or other parts. Oyle of Roses is not only used by it selection coole any hot swellings or inflammations and to binde and stay fluxes of humors unto fores, but is put also into

many other compositions both oyntments and plaisters that are cooling and binding, and restraining the furof humors. The dryed leaves of the red Roies are used both inwardly and outwardly both cooling, binding, and

cordiall for with them are made both Aromaticum resarum Diarrhodon Abbatic and Saccharum resarum, echos whose properties are before declared: Rose leaves and Mints heated and applyed outwardly to the stomackelly.

eth callings and strengthneth a weake stomacke very much, and applied as an Epitheme or fomentations the

region of the Liver and Heart doth much coole and temper the diftemperature in them, as also in fleed of a

Rose cake to the head and temples to quiet the overhot spirits, which will suffer no sleepe or rest to falleson the

ficke patient. Of the Damaske Roses are not made to many medicines or compositions, for beside the Conserve and Preserve, the Syrupe and Hony of those Roses (each whereof is called Solutive) the water and the diffilled

oyle or spirit which serveth more for outward perfumes then inward Physicke, as the dryed leaves to fill sweete

bagges and the like, I know not any other use made of them, and yet there is by many times much more of them spent and used then of red Roses, so much hath pleasure outstripped necessary use. The Syrupe of Damask Rosesi both simple and compound and made with Agoricke: the simple solutive Syrupe is a familiar safe and gentle case medicine, purging choller taken from one ounce or two unto three or foure, yet this is remarkable and wonderfull herein, that the distilled water of this Syrupe should notably binde the belly : the Syrupe of Roses with Age wicke is more strong and effectuall in working then the simple Syrupe, for one ounce thereof by it selse will open the body more then of the other, and worketh as much on flegme as choller t the compound Syrupe is more forceable in working on melancholicke humors, and availeable against the Lepty, Itch, Tetters, &c. and the French discase also. Hony of Roses solutive is made of the same infusion that the Syrupe is made of, and therefore worketh the same effect in opening and purging, but because the hony is neither so familiar to many or convenient to hot and aguish bodies, it is oftener given to flegmaticke then collericke persons, and is more aled in Glifters then potions as the Syrupe made with Sugar is. The Conferve and Preserved leaves of these R desare operative to the same effect in gently opening the belly. The simple water of the Damaske Roles is of somuch ule for fumes to sweeten all things as also to put into meats and broths, &c. that it hath left almost no ule for any Physicall purpose, yet it hath beene well observed by Costem in his commentary upon Messes, that tenne ounces of Pamaske Rose water drunke in the morning doth open and purge the belly, the dryed leaves of the Damske Rose serve most to make sweete powders, and to fill sweet bagges or the like, yet the same Costam in the same place she weth that the dryed leaves powdered and drunk in the whey of Goats milke worketh to the same effect in purging. The Muske Roses both single and double doe purge more forceable then the Damaske, and the single in he'd to be stronger then the double, for although none of the Greeke writers have made any mention thereolyte Mefues especially of the Arabians doth fet it downe: twenty of the leaves of the fingle Rose must be taken futh Camerarius, but more of the double kinde to open the belly and purge the body. The wilde Roses are few or none of them used in Physicke, but yet are generally held to come neare unto the nature of the manured Rosesboth in the earthy and binding facultie, Pliny fetteth downe in his eighth booke and fourth Chapter that the roote of he wilde Rose is singular good to cure the biting of a mad Dogge, which as he saith, (but how wee may be leeve him I know nor) was found out by miracle: the fruit of the wilde Brier which are called Hepper being thorough ripe and made into a Conferve wirh Sugar according to the manner of divers other fruits, before that it is very pleafant to the tafte, doth gently binde the belly, and ftayeth defluxions from the head upon the flormacke, and dryeth up the moisture thereof, and helpeth digestion; the pulpe of the Heppes dryed unto a hard confidence like to the injury of Licolians of the digestion. confishence like to the juice of Licoris, or so dryed that it may bee made into powder and taken in drinke stayeth speedily the whites in women. With the fruit Cookes and their Ladies and Mistresses doe know how to prepar many fine dishes for their tables. The Brier ball is often refed being made into powder and drunke to breake the Stone to provike urine when it is stopped and to ease and helpe the collicke : some appoint it to bee burnt and then taken for the same purpose : in the middle of these balles are often found certaine white wormer, which

bing dryed and made into powder and some of it drunke, is found by long experience of many to kill and drive further Wormes of the belly.

CHAP. XXVII.

Capparis. Capers.

He Caper tree or bush that was knowne to Dioscorides and Theophrastus being but one fort was thorny, but there bath beene fince fome other forts knowne, both that are and are not thorny, which for affinitie fake I thinke meete to joyne together, and with the Capers another plant, which for fome likenesse beareth also the name of Capparis sabage or leguminosa, Beane Capers, not intending to joyne it to the pulses as some might thinke it should be. 1. Capparis spinosa folio rosundo. Round leafed thorny Capers.

This Caper sendeth forth divers long weake trayling wooddy stalkes lying round about upon the ground. fet with gooked thornes like hookes or as the Bramble, at each joynt come forth two round leaves like unto Alarma oppositione unto another, from whence springeth also a small round head upon a pretty long footstalke, which antend from the flower before it open (and is that small round Caper which wee doe usually eate at meate) which from the nower before it open (and is that think round caper which we doe thinking eate at meate) whiching then gathered and pickled up with great falt, are kept in barrells and brought into other countries, and taken out of the falt afterwards and kept in Vinegar to be spent at the table as all know: but when it is optomission of foure white sweete smelling leaves, with soure other greene ones as the huske wherein they fachaving many yellowish threads and a long stillor pestle in the middle, which afterwards groweth to bee the faut, and is long and round like unto an Olive or Acorne when it is ripe (which also are brought pickled to madarethe long Capers which are used) wherein are conteined divers hard browne seede somewhat like unto the kentles of Grapes: the roote is great, white, long and somewhat wooddy covered with a thicke barkeruning and spreading much in the ground, so that it will quickely spread a whole field in the warme countries and asker barren, and is somewhat sharpe and bitter : the stalkes perish in Winter every yeare, and arise againe anth in the Spring.

2. Capparis spinosa folio acuto. Thorny Capers with pointed leaves. This other Caper differenth from the former neither in the thorny growing nor in the flowring, nor in any oderthing then in the leaves, which with the roundnesse are pointed at the ends, and this is sufficient to know it by.

2. Capparis non spinosa fructu majore. Egyptian Capers without thornes. The Eppides Caper differeth not much in the manner of growing from the former, but that the stalkes grow.

T. 2. Capparù spinosa folio vozundo 🕁 acuso. Therny Capers with round and pointed leaves.

TRIBE 9.

greater and more upright without any thornes on them, the leaves are round and fland two at a joyn like the state of the fruit area. greater and more upright without any thornes on them, the like manner, and the fruit greater the angle former, the buds are greater and fo are the white flowers in like manner, and the fruit greater the angle the former: this loofeth not the leaves in Winter as the others doe, and herein confift the chiefe difference. 4. Capparis Arabica non Spinosa. Great Capers of Arabia.

The Arabian Caper is a small shrubbe growing up with many upright stemmes without thomes, the kine flowers and fruit are greater and larger then the last Egyptian kinde, the fruit being of the bignesse of meteor Wallnut with divers seeds therein, of a sharpe and biting taste as Dioscorides hath noted, and other size has been supported by the state of the same of the same seeds therein. time of our later writers.

5. Capparis fabago sive leguminosa. Beane Capers.

The Beane Caper rifeth up with divers greene herby and not wooddy stalkes like the other, branching furth from the very bottome, at the severall joynes whereof grow two leaves opposite one unto another which me alwayes two together at the end of the footestalke, being somewhat like unto Purssane leaves but in the police and colour resembling the leaves of Beanes: the flowers come forth singly one at a joynt with the leaves which before they are blowne open are very like unto Caper bloffomes, being white francing in green huske and with many yellow threads in the middle, after which the fruit followeth form what long and round and opening into severall parts, wherein is contained small brownish seeds a the roots is long and wordy shorter forth long strings and branches under ground many wayes.

The two first forts grow naturally in the stony places of Italy, Spaine and some parts of France, as also in melio the hot countries Eastward, yet that with pointed leaves not fo frequent as the other. Theoperafin faith their will abide no culture, yet Pliny sheweth that in his time they used to plant it in Italy upon ridges cultup, and the deepe trenches filled up with stones to keepe in the roots from overspreading the field or ground where they were planted, or else that the stones would make them fructifie the better, the third Bellonium saith growth in Egypt in a loofe fandy field not far from the Lake Mareotis which is about halfe a mile from Alexandris the found he also found as he saith in the clefts of the rockes on mount Taurus in Arabia.

The Place. The two first forts as I said before shoot forth their stalkes and leaves in the Spring, and their slower shortly after, when as their fruit is not ripe untill the end of September: the other two keepe the same times of flowing and fructifying, but keeping their old leaves on and shooting fresh every Sping : the last flowreth and feeden in the end of Sommer.

The Names.

It is called in Greeke xamules and Capparis also in Latine, Gaza Theophrastus his interpreter callethit Interior Pliny femeth to thinke it was the Cynoibatos of Dioscorides, because among the bastard Greeke names in Dia scorides, Cynosbates is one which bee saith was given to the Caper in his time. The first is mentioned by most writers, but the second but by a few, Alpinus in his booke of Egyptian plants, and Bellonius in his second booke of Observations and Chap. 21, maketh mention of the third by the name of Capparis non frings and arings in the fourth is also remembred by Bellonius in the said second booke and 66. Chapter, and by Rannels in his Itinerarie: the last is called by all moderne writers Capparis Leguminofa, or Capparis Fabago, by Lugdannis Fabago Belgarum, by the Syrians as Rauwolfius faith Morg (ani, and taketh it to be the Andirian of Rhafi and the Aldiffigi of Avicen: Column thinketh it most properly to agree unto the Telephium of Diofcorides : Banhimu calleh it Capparis Portulaca folio, and faith it was called Peplus at Paris, and therefore Lugdunenfis callethit Polis Paris flenfium; all nations call Capers according to the Greeke and Latine, varying but the accent according to their

The Vertues.

The Capers, such as come over to us pickled up in salt doe nourish nothing, yet doe a little move the belly, but being washed from the Salt and steeped in Vinegar and so eaten do stirre up the appetite dejected or decayed and doe a little clense the bowells of flegme flicking to them and avoyd it, as also doe helpe to open the obliructions of the Spleene and Liver : Galen theweth in feptimo fimpl, med, that the Barke of the roote of Capers confilleth of various qualities, namely first extreme bitter, next sharpe, then sower, by the bitternesse it clenieth, purgeth and cutteth, by the sharpenesse it heateth, cutteth, and digesteth, and by the sowernesse it contrasteth thickneth and bindeth, and thereupon faith it is a medicine above all other availeable for the hardnesse of the Spleene, whether it be applied outwardly of it felfe, or mixed with other things to annoint the place, or the rootes boyled in Vinegar or Oxymell and taken inwardly, or the powder of the roote mixed with the faid decoction and taken, for it is certaine that it avoyderh grosse and viscous humors, not only by the urine but by the belly also, and oftentimes it bringeth away with it congealed and corrupted blood, and thereby giveth much case to those that are troubled with Gouts or Palites, with the Spleene or paines in the Hippes or Sciatica, weakenefie in the Neives and Sinewes, and for women that have their courses stopped to procure them: it draweth from the best and other parts those offensive humors that are the original cause of Ruptures, Convulsions and Crampes, and thereby give them much case: the barke of the root of Capers is an especiall remedy to helpe sowle Vices, being made into a Pultis and applied, for it clenfeth and mightily dryeth them, and is also good for hard wellings and kernells under the cares and the Kings Evill: the fruit is also effectuall for the faid purposes, and some both leaves and stalkes, but all of them weaker then the roots : the feede bruised and heated in a little Vinegar and held betweene the teeth eafeth the tooth-ach; the fame rootes also boyled in oyle and dropped into the ease easeth the paines and killeth wormes breeding in them; the leaves and flowers, but especially the barke of the roots (flewered or boyled in Nicoland in them). roote steeped or boyled in Vinegar clenseth the skinne of all morphew, freekles, spots or any other discoulouring of the skinne what foever: the oyle that is made of Capers is of very good use against the paines of the sides and Spleene. The Arabian fort is much more sharpe and almost exulcerating, and therefore as Plusy well faith it is not fit to use for yieless a sharpe and almost exulcerating, and therefore as Plusy well faith it is not fit to use for yieless a sharpe and almost exulcerating. fit to use so violent a stranger, better it is touse our owne Europian kindes. The Beane Caper isused by the Syrie ans as Ranwolfiss faith to kill the wormes in children and to drive them forth.

CHAP. XXVIII.

Oyacantha Diofeoridio quibufdam, idoft, Spina acuth feu potine Spina appendin Pling, The white Thorne or Fawthorne.

He Hawthorne hath not beene knowne formerly to be of any more forts then one, but wee have in our

time not the knowledge of two other which shall be presently shewed you.

1. Spina appendix valgaris. The ordinary Hawthorne.

The common Hawthorne groweth up in some places to be a tree of a reasonable height if convenient forming and keeping helpe it forward, otherwise it groweth to be but a shrubbe or hedge bigh, with some places and cut in on the edges into divers places sharpe thornes and faire shining leaves, somewhere the property of t

formate many flanding together, comming forth both at the top of the branches and upper joynts with the leaves. confing of five white leaves a peece, with divers white mediathe middle, tipt with red, and of a very pleafor freete fent, after which come berries fomewhat ing with the roundnesse of a lively red colour when the schilly ripe and fomewhat fweete in tafte, conteiing within them divers white feedes lying in a flocky or bonic fabiliance which make it harfh in talling, and if ishould beceaten it would sticke to the throate and hurt the winde pipe : the roote growerh farre and deepe.

2. Spins acuta humilior. The low Hawthorne. The low Hawthorne never groweth to high or great as beformer, the leaves are finaller but longer divided on the election the fame manner : the flowers also are white ad (weet and grow in tufts or clusters, but the fruit that followethis yellow tending to a Saffron colour, in other this it differeth not from the other.

3. Spina acuta biflora Britanica. Englands Hawthorne.

Webve another fort of Hawthorne growing in divers luctofor Land well knowne to those that dwell about hepiace where they grow, yet not greatly regarded or wadered at by them nor yet by many of those that have freethem growing : but I doe not thinke fit that it should kolightly patied over or to finally respected, for I supphirastrange worke of nature, or of the God of nature inter, to cause such a tree being in all parts thereof like we the common Hawthorne, to bloffome twice every rue, the one time usually in May as all others of the laddee, the other about Christmas, eyther somewhat, blose or somewhat after, according to the temperature the Winter at that time, for if the Winter before bee ide without either great frolls or other hard weather, it willbein bloffome white all over as in May, sometimes in Merember, or elfe in December, but if it bee hard and

hape weather it will not bloffome untill I answay that the hard weather be over e it beareth also after these flowmatpaligreene berries, even in the Winter before any greene leaves doe appeare or blossomes in May, fo hanwill have both ripe fruit and greene at one and the fame time spon the tree; there hath not beene observed maker difference betweene this kind and the ordinary Hawthorne Some might thinke as it hath beene diwhat difference betweene this kind and the Ordinary Frawthorne Some might thinke as it has been distributed among divers that this happeneth, by reason of some hot springes that take their course by the rootes of them, which reason I grant hath some appearance of likelihood, but wisely some and considered, is too specificate to hold weight, for how should one tree only blossome in a place, and none of all the other trees in the small or compasse of the same springes running; and besides this there are of these trees in divers places whellad, as in Rammer Marsh in Wher street, as it is vulgarly called, but should be rather High street, where landerin a moorish ground though upon a banke beaten with cold and Northerly blasts, and exposed to the the winds on all fides, having no fhelrer or defence, but franching in a flat and open foyle, where I thinke no highing either doth or is likely to breake forth or runne neare it r let the wife and judicious fran it throughly. the come to passe by the nature of the soyle and springs, or the naturals kinde of the tree.

The Place. The fiftheroweth every where in the bedges and borders of fields and woods: the fecond in Germany: the state of the first state the bathes of thornes which there they call greenes.

The time of these to flower is specified to be ordinarily in May and extraordinarily about Christmas sometimes the before and sometimen a little after: the fruit is ripe on the ordinary week in Sopeember, and doe hang on had the Winter as meate for birds, or untill the frofts doe make them fall.

CHAP

The Names Very many (as Matthiolus, Lacuna, Turner, Belloniou, Lobel, Dodonaus, Camerarius, Cafalpinio, Ramolfatth Very many (as Matthiesm, Laune, I were, senemen, sever, 2 very and the O'Eudgeron Oxyacantha of Disfunder which he lius, Tabermontanus and some other) due take this should be described to be like the Peare-tree but lesser, and very thorny, bearing a berry like unto those of the Myde be described to be like the Peare-tree but lesser, and very thorny, bearing a berry like unto those of the Myde be describeth to be like the rease-tree pass sense; appearing a being like that it is notes of District. be red, full and easie to breake, having a stone or Keppell within it, some also thinke that it is notes of District. others take it to be the O Evizor S. O Myacanthus of Galen, which he likewise said is like unto the wide hap others take it to be the O'Evaignos Oxyacanthm of Galen, which he likewife faith is like unto the wide has tree in forme, and not unlike it in qualitie, to that the ones masculine the others farminine are but one both ones by the judgement of many the best, Eleibarists although some take them to be divers, as Comming who are make the Barbery bush to be the Oxyacantha of Oxyacantha of Dissorties, and solvent Cordan upon Dissorties and Tabermantanus, Elemahaus and Ruellius likewise doe take the Barbery one of the control of the dissorties of the same of the control of the same of the control of the co Barbery being moyst and full of juice, Tragm faith that some tooke the Hawthorne to bee, Arten Justin phrastus his Oxyacantha is neither Barbery nor Hawthorne, which in his first Booke and 15. Chapter he man among those trees that are ever greene, which cannot be faid of either Barbery of Hawthorne, for that manager or countries they are knowne to keepe their leaves, but to looke them in Winter, but by the judgement of help and most expert Herbarists in our times, the Pyracantha as I have declared in my former books is the une organization cantha both of Diefeorides although hee hath not mentioned any sempicernitie of leaves, and Theophella the agreeing thereto in all things: Some there be allo that would make the Spina appendix Plins to be the Barbery bulh as Lugdanenfit, but Cluster is against that opinion for that there is there are these two doubts, said that Plins is against that opinion for that there are these two doubts, said that Plins is feel had meant the Barbery by his Spina appendix would not have forgotten the three thornes that gow to gether in the Barbery which is emment enough therein : and next bee would not have forgotten the yellown. boir, both in the barke, of the branches and rootes: but the most judicious of these later times, among whomis Gesner in boreis and Closius in historia have determined that Spina Appendix Pliny, which sometimes also tale the Spina simply, can be no other thorne then this Hawthorne, which Tragus and Lonicerus tooke to be Cymsus Spins imply, can pe no other thorne then this to awthorne, which I rague and Louiserm tooke to the Judges. Theophrafti, and Cordon in hifforia calleth it Sorbys aculeara, Anguilara Spins alba unigo, and Spins acutau Dedoness doth also. Bashinus placeth it among the Mediars calling it Mehilus api folio frue firis spinosa fin Organica, and as a kinde thereof likewise putteth the Pyracantha, but in my opinion he had done better and more rightly, to have referred them both to the kinds of Services whereunto they better agree then unto Median in that Services are smaller fruits as these are: the second here expressed is mentioned by Dodoness under the same of Spind acut a humilton : the last 45 % kind peculiar to our owne countrey as I thinke, I have here set forth unoyou of Spina acuta manuscore trip late as a kinia peculiar to our owner countries as I thinkes, I are included more exactly then Gerard, who onely had a superficial notion or rather relation thereof. The Hawthornes called by the Arabidas America, by the Indians in some places Empaio, and in others America, and profession, by the Spaniards Phillipso, by the French Aubespin (Ruellius saith that the vulgar fort doe call it South, yet Quercetains settleth a fout downer in some of his receipts by the name of finition Southerness in his Pharmanuscus. fituta to be Paliurus unlesse hee thought the Paliurus to be the Hawthorne:) by the Germans Hagenders, by the Dutch Hagendoren and by us in English Hawthorne, or Hedgethorne, Whitethorne and May or Maybab, because our ordinary fort seldome or never flowreth before May and never after, The Vertues

The berries or the feedes in the berries are generally held to be a fingular good remedy against the flore, if the powder of them be given to drinke in wine : the same is also reported to bee good for the Dropsie: but whereas divers have attributed hereunto a binding or altringent qualitie Anguilara his judgement was (whom Manhium confliteth) that Tragus who faith that the leaves flowers & fruit are drying and binding, and that if the flowers contucts) that Trages who large that the leaves nowers or right are drying and binding and that it accounts freeped three dayes in wine, and afterwards diffilled in glaffe, the water thereof drunke is a foveragnerous dy for the Plurific and from in water free the diffilled water of the flowers by an ordinary way by eth, faith he; the Plurific Laske diffile belly the feeds cleared from the downe bruifed and boyled in wines drunke performent allo the fame effect; the faid diffilled water of the flowers is not onely cooling but drawing also : for it is found by good experience that if clothes or spunges be wet in the sayd water and applied to any place whereinto thornes, splinterente. have entered and bee there abiding it will notably draw them form the vertues given by Galen unto Oxyacamba doe not pertaine hereunto, for faith he the fruit thereof is not fower. harth, especially when it is ripe, but sweet and therefore more fit to open then to binde the belly, and furto bring downe then to ftay womens monethly courses but the last evinceth this errour.

CHAP. XXIX.

Sabina. The Savine tree or buth.

Ne fort of Savine I have expressed and set forth in my former Booke, the figure whereof I here here you againe the other forts shall be exhibited in this Chapter. 1. Sabina baccifera major. The greater berried Savine tree.

I. Sabina baccifora major. The greater berried Savine tree.

The greater Savine tree that groweth with us foreadeth not fo much as the former Savine doth, but rifeth more appright to a mans height (but Bellonius faith in lib de coniforis that he five it as highs an Almond tree on the mountaines Amanus and Ofympus in Plarygia) spreading forth arms and branche fully furnished with leaves, which at their first comming forth are somewhat like unto Tamariske leaves, but tang growen old they are more like unto the leaves of the Cypresse tree, hard and pricking, and of a darks green colour with an eye of blew shadowing them of a sent less trong and nothing so sharps as the ordinary a shahat been observed to be are any slowers but small round berries like unto Inniper perries, but greater and of a sharp tasse, blacke when they are ripe with an eye of blew upon them like the Inniper or the ordinary savinament divers have held to be barren, taking their authority from Plary, who also said that Rosembry beauting their authority from Plary, who also said that Rosembry beauting to both

ha which are found untrue by good experience, as Fuch five, Cor-in, Gifur, Dydoness and Lugdonen fir doe tellifie, yet Camerarius inhibit studin one kind that it beareth no fruit, but not in the the, but Lobel faith the ordinary doth beare berries although minstewplaces and but feldome, and both of them holding his fruit on the branches all the Winter, untill greene ones grow

athemana never loosing their leaves.

2. Sabina baccata altera. Gentle Savine with berries.

This other Savine groweth somewhat higher then the last as it. fearth in Europe, and almost unto the height of the Phenician Cypelle ke Cedar, fireading more flender and weake bran-in whereon are fer small and long leaves, of a more gentle we then the reft son the branches among the leaves come forth white berits as the other, and very like unto Iuniper, blacke Combanthey are ripe, and but little bitter in talte, not altogether

The full groweth in Candy, Milia, and other thole East counis, the known on the mountaine Taurus, Amanus and Olympus: to the upon the mountaines in Apulia and Calabria of Naples, vallom the plaines of the Alpes neare unto Gratianople.

The Time, The Time, and thew their ripe berries not untill

Savine (aith Galen is hot and dry in the third degree, and of very thin yerts, by the hope dry ad being qualities it suffereth no consolidating or glewing properties obe in it but by reason of the green through the it digesters the more and hath less bitternes then is in the Cypresse; it refineth purress did not a powerful with Cypresse, especially if they be of long continuance, and not case to be holpen, for mixed with some Honyard up. plied, it clenfeth the filth of Vicers, and taketh away their blacknesse. It breaketh also or dissolveth Carbands and Plague force: Matthiolus faith that a dram in powder mixed with three ounces of Niter and two cuncis of Hony doth wonderfully helpe those that are short winded : the decoction thereof drunke doth provoketheour fes, and draweth forth the birth and secondine, and destroyeth the living the same outwardly applied, or the fumes there of taken underneath worketh to the same effect the said decoction taken expellethblood by Vinc. & is profitable for the Kings Evill; it killeth the wormes in children, but it is fafer to use it outwardly and wapply it to the Navell, or to annoint the belly with the oyle of Savine. The powder of the leaves of Savine mixed with Creame, or the greene leaves boyled in Creame and annointed on the heads of children, which have feable or running fores or dry fores, clenfeth them throughly and healeth them, as also Saint Anthonies, fires the first heart bruifed and layd upon running and fretting Cankers and the like, killeth and destroyeth them the powder of the leaves used with some other things, or strewed upon doth helpe to the blitters that side on the yard by inodinate luxury, after they have beene bathed with the decoction of the leaves. The distilled water three infinites. gular good to clense the skinne from spots or markes therein, and other deformities, and helpeth those hather a giddinesse in their braine: the smoake thereof burned cureth Hens that have gotten the pippe, and is estended for the Bottes in Horses or cattell to give it in their drinke: but it must bee warily given for feare of danger.

CHAP. XXX.

Inniperm. The Iuniper Tree.

Here are two or three forts of Juniper Trees some greater others lesser, whereof I meane to make inchis Chapter and shew you their varieties,

1. Innipersa vulgaris fen miner. The common luniper Tree.

The common Juniper Tree (in some places groweth nothing so high as they doe in other, even in our owne Land as well as in Germany, but of an exceeding great length in Italy and Spain as Matthiolis and Clusius fay, so that they doe there make Rafters and Beames for houses thereof rises up with a stemme or stocke covered with a reddish barke which often cleaveth and falleth away, the wood indented being formewhat yellow hard and very durable (for as Pliny faith that Diannes temple at Epbels had the Beamet and Rafters thereof for the more durabilitie and very (west when it is burned, the coales that are made of the wood being burned and covered with its owne after, keepe fire in them a whole years as it is reported) from whence spread divers branches set with very small and long narrow blewilli greene leaves, three for the most part alwayes together which are almost like unto thornes, but not so hard or pricking the blooming in the perceived like a little yellow dust falling round about in the Spring of the years, after which constraint greene betries, not ripe ning fully untill the second years after their first comming forth, which then will be bade with an eye of blew thereon calely wiped away with touchings as it is in a ripe Damion, (some form manual) with an eye of blew thereon calely wiped away with foldings as it is in a ripe Damion; (fone forth rouse and of the bignesse of a Pepper corne, others as great as Sloce, and some a little long, within) so that hell will be always supon the bearing trees both greene and ripe berries, wherein are contained small hard seed the root fomewhat reddish and spreadeth many branches: this doth always a thick greene, and in the Bottle contained france, Spaine, Italy, &c. dock, weeld a certaine hard and thy guinant in small peech; somewhite the state of the same with the state of the same with out any berries fucceeding.

This low Juniper feldome rifeth to be two foote high; but groweth Jow spreading riese the good from the first for the first and rinke armes and branches as the former; which yet are plyant and easier bendfur for the feat to these branches grow the like three leaves together; but they are fliorer broader these and not found picking.

TRIBE 9. haiserus valgeris fen minor. 3. Immperus maxima Illyrica.
The great Sclavonian Iuniper. The common Iuniper tree.

thapeasthey, and of the fame blewith greene colour underneath but greene above: the fruit or berries weeker like the other but a little longer, of a fweet fent and sweetish take at the first but bitter afterwards uniculant like the other.

3. Inniperus maxima Illyrica. The great Sclavonian Iuniper. higher Inniper Tree rifeth to the height of a great tree, whose leaves are greater and harder more like unto mathenthe other : the berries likewife are much larger, of the bigneffe of an Hafle nut in fome places and solive in others formewhat long with the roundnesse, and more blew when it is ripe then the other which is

triped away, but a bideth firmely thereon. 4. Imiperus major Americana, West Indian Cedar or Iuniper.
Sintre which they of our English colonies in the Bermuda and Virginia, & c., call Cedar groweth very great

the (for I have seene boards of above twentie foote long, and halfe a yard broad brought from the Sommer blands for the sommer with branches, and small short leaves like those of the greater luniper growing thereon: the was small and blewish not much bigger then our ordinary Juniper berries : the wood is more red and of a en fent both burnt and unburnt then our ordinary Juniper.

The Place

Inful groweth especially in Woods in Kent and fundry other places in the Land: the second groweth on the the and flony places of the Alpes as Clufius faith : the third groweth on mount Taurus in Syria as Bellomius adjuste the Sea shore of the Venetian Gulph and Illyrium as Anguilara saith, and as some say also in sacof France : the last as is faid in the West Indies in sundry places. The Time.

Unte duftie flowers cover the ground being blowne from the branches, and as I said the berries are not multiplaye growne on the bushes two Sommers and a Winter. The Names.

and Arcenthos, in Latine Inniperus fic dictum putant quod mot mules fruitus pariat antiquis marce sentibus: solam enim fere arborum fatus sus in biemium provogare in Dissentes and others doe make two forts or kinds, a greater and a lesser, concerning the greater there comovefic among many of our moderne writers, about the text which faith, the berries are as great as which Marcellus and Ruellius thinke is militaken; and should be wises as great as a Beane, for there way very seene of halfe the biguesse of a Wallnut: but out of Greece some have witnessed to have being benies of the biguesse of a Beancor Hassell nut almost. The berries are called in Greeke drawning and in Latine Bacca Juniperi or Grana juniperi: The gumme that runneth from the tree when it is called of some Vernix or Vernia quasi veris res, issuing forth in the Spring, as also Sandaracha Arabum Schemie, for their Sandaracha although alike in name yet is quite another thing, even Auripigmentum schemic called Cinabrium minerale; the Latines call it as I faid Vernix but Cornarius faith that it is affally anniversal.

apply to this gum, for Vernix is a made thing of Amber and Linfeede oyle : for faith her the same Vernix is apply to this gum, for Dernite is a some times or Bernisten, which is with them the yellow Amber as it commends the place where it is gotten, and tooke the name from the propertie therein, that as that to this being had the place where it is gotten, and tooke the name from the propertie the term, that as that we this pens hidden will but ne like a Candle or Torch: *Vernix liquida*, in English Varnishe is a certaine liquor that Painten, Jona and others doe use to lay upon their workes, and Smithes upon their polished painted Iron workers here and others doe use to say upon their who hereof for their use is made of this gumme of the lumps the and of Linfeede oyle: Pliny in his eleventh Booke and seventh Chapter mentioneth another Sendonth which is found in Bee-hives, being their foode whereon they live while they worke, and is called Eribban (to dish doth) and Cerinthus, but by divers others learned men Vernix and Vernitago. Bankinus maketh two long of the ordinary Iuniper tree, the one he calleth luniperus vulgaris fruticofa, the other Inniperus vulgaris ship, who as Clufins sheweth that there is no other difference betweene them, then the largenesse of the growing is about climate in the like manner as the Turpentine and the Storax trees, like shrubbes in some places and all men in

others. The second Clusius calleth Iuniperus Alpina and Gesner in hors is Iuniperus minima: the third is allely Lobel in his Observations and Icones, lumperus maximus Illyricus carulea bacca, by Lugamons Innium and by Tabermontanus Iuniperus major Illyrica: the last as I said is called Cedar by all our English in this materials. Bermula, &c. & with us from them who never scanned it sufficiently, nor knew to give it the true denouation for all the forts of Cedar doe much differ in sundry particulars from this, and therefore I have present them. intitle it untill some other can give it a truer epithite. Serapio calleth it Habbagar, the other Arabian francis

Archenas, the Italians Ginepro, the Spaniards Enebro, the French Geneve and Genewier, the Genewith de baum and the berries Weckholder beer und Kramer beer, of Blacke birds who are called in the German tonger Kramer vogell because they teede upon the berries all the Winterlong, the Dutch Genever boom, and the in

English the lunipre tree. The Vertues.

No man faith Tragus can casily set downe all the Vertues of the Iuniper tree, presenting the benies before Pep. per : the Iuniper it telfe both leaves and wood as Galen faith are hot and dry in the third degree : but the berief although they be in the fame degree of heate, yet are but in the first degree of drinesse the gumme is hot and dry in the first degree: The leaves and young tender branches of the Juniper tree, or the juice of them or of the brine or the berries themselves taken in wine, are very effectuall against the biting of a Viper or Adder, at also guint the Plague or Pestilence or any other infection or poyson, the Germanes use it much, for their Treakleismers the condensate juice of the berries, which they commend in all diseases almost, both for inward and curward in medies the same also is profitable against the Strangury and stopping of the Vrine, and sopowerfull against the Dropsie, that as Matthiolus faith hee hath knowne divers to avoyd fo much water by Vrine, by taking four or five ounces at a time of the Lye made of Iuniper afhes, that they have beene holpen thereby; it dothalloword womens courses being stayed, and doth helpe the rising and other paines of the mother: the besties according the fromacke and to diffore the swellings and windinesse thereof ; and are likewise profitable for the coughant shortnesse of breath, and other diseases of the Chest and Lungs and to ease the griping paines and tomens in the belly, they are also prevailent to helpe Ruptures, Convulsions and Crampes: to procure a fafe and editedelivery unto women with child, for which purpose Matthiolus adviseth to take seven Juniper, and strengly berries, halfe a dramme of Cassia lignes, and a dram of Cinamon, these being grossely bruised put them into the seven supposed to the seven belly of a Turtle Dove to be rofted therewith, ler it be bafted with the fat of an Hen, whereof they are to can every other evening: The scrapings of the wood faith Dioscorides being eaten doth kill men, which daulebod Matthiolius and Tragus before him finde much fault with, seeing it is contrary to the former part of the Ten at thrush thereinto by others, for as he saith neither the best copies have it therein, neither doe Galen, Paulus of meta, nor Serapio who wrote wholly after Dioseorides his Text word for word make any such mention of the properties of the wood, and more faith he it is found falle by tryall made thereof : but Scaliger in his 15. Book and 18. exercise, maintaineth the Text of Dioseorides, in that although the decoction of the wood is wholetome, yet the scraping or course powder by the drinesse thereof sticking to the guts doth sufficite, in the same manner as Colocynthia which to bee rightly prepared must bee beaten and finely sisted least it cleare took bowells and blifter them ; the berries are very comfortable to the braine and ftrengthen the memory and fight and all the senses and the heart also : being eyther drunke in wine or the decoction of them in wine nkm; the same also is good against a quartane, and dissolveth the winde in the belly and in generall is effectuall for all de feafes as well outward as inward proceeding of any cold cause, if they shall take of the berries two or three time a weeke three or foure at a time in wine, which must be gathered in the fit time of the ripents, months and after fairely dryed upon a cloth: the Salt made of the ashes of the Juniper wood is a singular remedy for the Scurvey, the putrefied and spongy gums, and generally resisting all punefaction: It aforefaid : there is an oyle also drawne out of the Iuniper wood per descensum as they call it, which it ry good against the touthach and for the Goute, Sciatica and resolution of the Nerves or Sinewes commit of cold. The gumme of Iuniper is used like as Amber is to stay cold rheumaticke distillations, defluxions and Co tarrhes upon the eyes or Lungs, &c. the fumes thereof upon the burning on coales being taken into a cope (head also holden in the meane time over the said fumes) at night and to lie covered therewith: or the powder of the powd thereof with other things fit for the purpose, strewed upon Flax and to be quilted into a cappero between the night chiefely, and in the day also as neede shall require; the said gumme in powder taken in wise don his vomitings, inward bleedings and spitting of blood, womens courses alto, and all other the stures of the blood and of the hemorrhoides or piles : the same also killeth the wormes in children, and mixed with some ofte Rofes and Myrtles healeth the chappes of the fundiment, kibes also and chilblanes on the hands and feet the policy and chilblanes on the hands and feet the policy and chilblanes on the hands and feet the policy and chilblanes on the hands and feet the policy and chilblanes on the hands and feet the policy and the policy der of the gumme mixed with the white of an Egge, and applyed to the forehead flayeth the bleeding at nose the fame also burned upon quicke coales, and the fumes thereof taken thorough a fumel took and the fumes thereof taken thorough a fumel took and the fumes thereof taken thorough a fumel took and the fumes thereof taken thorough a fumel took and the fumes thereof taken thorough a fumel took and the fumes the fumes the fume to the fume t tooth taketh away the paine: it is effectuall in moilt Vicers and Fidulaes, and weeping running fore, rough the moilture in them which hindereth their cure : the liquid Vatnish is an especial remedy again felding water or burnings with fire, and to helpe the painefull and bleeding Piles, and Palife, Crampes, Corruloss the Nerves and Sinewes: The smoake of Juniper wood being burned, besides that it yeeldeth a good feature from the party bouse it is of good of the party bouse. fume any house, it is of good use in the time of insection, and driveth away all noysome Serpent He

Water Acc. the after of the wood or barke made into a Lye with water doth cure all itches, feather puffules or one captions in the skinne, yea and the Lepry also if the places be bathed there with. The Germanes Treakle observes is smale in this manner. Take what quantitie you will of fresh but ripe Imaiper berries, bruife item doyle them in a reasonable quantitie of water untill they be well boyked, straine and presse them hard item the bardet, which pulpe and liquor set to the fire against in a glassed earthen vessell, and evaporate away so much of bardeties, thering of it continually as untill it become of the thicknesse of an Electron which the in press, wanted prints of it continually as untill it become of the thicknesse of an Electuary, which then put into the hunting, thering of the continuanty as until it decome or one unickness of an electuary, which then put into point gains to be kept for your use, whereof a small quantitie taken morning and evening doth wonderfully below that are troubled with the Rone in the Reines or Kidneyes, with the Chollicke, with the paines of the mother, and the stoppings of their courses, is good against Catarrhes and rheumes, the Shortnesse of the hearth also could be a supported by the stopping of the hearth also could be a supported by the support of the supported by the support of the s ad winde, the straightnesse of the breast, the cough, the cruditie, rawnesse and indisposition of the stomacke. gual the Plague and other infectious diseases, for it preserve thand defende the heart and vital spirits from inching and venome, and against swownings and faintnesse, the paines, swimming and giddinesse in the head, guid frende also and madnesse, for inflammations and theumes into the eyes, and preserving the light, describe in hearing, and stench of the gams mouth or breast, helpeth the Dropsie, Jaundies, Falling sicknesse, plies and Goute, healeth inward Impostumes: in briefe it not onely helpeth all diseases wherewith the body is confessed, but keepeth it in health and free from all diseases. This one thing is memorable thereof, if it be credible that Total faith thereof in his tenth Ecloque, that the shadow of the Iuniper tree is hurtfull both to man and the come in thele verles,

Surgamus, folet effe gravis cantantibus umbra, Inniperi gravis umbra nocent & frugibus umbre.

CHAP. XXXI.

Oxycedrus minor. The prickly or small Cedar.

Doe not intend in this place to speake of the great Cedar, in that it neither hath thornes nor prickly leaves, but of some of the lower and lesser forts which are prickly as they follow.

1. Oxycedrus. The prickly Cedar. This prickly Cedar groweth in some places to be a tall tree, but most usually not much above a mans bigh, whose body is crooked and bending covered with a scabbed or rugged reddish barke, upon the branches growling and narrow, therpe and prickly leaves like unto those of Juniper but longer and bigger, three for the most partiet together, among the leaves come small yellow flowers, which turne into round berries greene at the fift and yellowish after, but of an excellent red colour when they are thorough ripe, larger then luniper berries

1. O'yeedrat. The prickly Cedar.

2. Cedrus Phanicea fotio Cupressi. Cypresse-like Cedar.

by much as the other Cedars that follow, formerines growing as great as Hafell auts, banked of a places, with three or foure finall uneven white feedes wishin them, greater these those in the Intimate which berries abide on the tree all the Winter, and fall not a way untill young ones are budded and growing the Control of the Control

which berries abide on the tree all the Winter and fall not away untill young ones are budded and group at 2. Codrus Phanistra falls Capus fit. Cyprofile like Codur.

This other Cedar hath likewrife a crooked freeme, feldosse growing above a mans height, foreid in a armes and smaller branches, covered with a regigied reddish barke, the lower leaves especially of some before it be fit to beare fruit are long and sharpe pointed, like unto Insiper leaves but longer, but the new into or when the trees groweth elder, doe change their forms and become that and plained like unto Cyprofi longer. fharpe or prickly at all, to that one would thinke verily that feeth them at feverall times, that the ones worth that pe or pricking at all, to true to be would turn be very that west and refinous: at the end of every branch counts for the a yellowith flower, which afterwards turneth into a round berry, greene at the first and reddill what is ripe, being somewhat mellow, tasting more bitter but a romatically, conteining within it three or fone some .

3. Cedo in Phonice minor. The letter Cypresse like Cedor.

This little Cedar is in all things like the last, but losser both in body and leaves, the fruit also is liked.

to, and reddiff, when it is ripe, but smaller, even no bigger then I uniper berries. be Place.

All these sorts grow as well on the mountaines Tauru, Amanu and Olympu, as neare the Sea file, with mountaines not farre from Mompelier in Narbone, and in Naples also, and in Moravia as Matthidin with The Time.

They bloffome in the Spring of the yeare which foone fall away, the fruit followeth but will not be tipe to till the next yeare after the full springing berein like unto the luniper.

The Names. The first is called in Greeke O'Evildere & Kido@ Xuela, Oxycedras and Cedras Lycia, of tome Cedras betiere and minor Phanicea, to put a difference betweene it and the great Cedrus, which is called Phanicea allo and me fora, because it chiefly groweth on the hills in Phenice, some also call it Cedras Phenicea folys Caprelli, Thefitis oxycedrus Phanicea, by Matthiolus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, but the Cedrus Cedrus Phanicea, but the Cedrus Phanicea, but the Cedrus Phanicea, by Gefner in bortis Cedrus and Tabermontamus Cedrus Phanicea, by Gefner in bortis Cedrus Phanicea, by Gefner in by Gefner in bortis Cedrus Phanicea, by Gefner in bortis Cedrus Phanicea, by Gefner in by Gefner in bortis Cedrus Phanicea, by Gefner in bortis Cedrus Phanicea, by Gefner in by Codrula, by Caftor Durantes, Codem miner vel Phanicea, by Anguilara Inniperi prima Species five Diskeriti Ind perus, by Lobel luniperus major Monspeliensium and Oxyarcentis sive Inniperus acuta, by Cordin on Dissentince dress magna five Iumiperus percerina, by Cafalpinus as it is likely Juniperus montana finilu flavo, and as likely be Camerarius, Iuniperus major Italica baceis rubris. I doe not fo much wonder at the variable opinions of diverse our later authors (who not knowing or not thoroughly confidering each herbe whereof they wrote to confider them exactly b/ those of the auncients in that herbarisme or the knowledge of herbes was not so exactly howe unto them, they living but in the dawning of the light of knowledge have some of them as you may kelme related, called that a luniper which others afterwards have most truly referred to the Oxycedrus of Gulmand Theophrasius, who also as I said before called it Cedrus Lycia as Pliny also did) as I doe at Banbism of whomevery one did expect in a worke of fortie yeares gathering, a true definition of every plant, that hee should reher make this tree a Iuniper (all the forts of Iuniper giving blacke or blewish herries which in my opinion is activatine note to know them from the Cedars that give red berries) and place it among their forts calling it same major bacca rufe cente then among the Cedars, when as yet he himselfe doth acknowledge it a Cedar, and dothic it downe for the Oxycedrus Theophrasti and Galeni: the second is variously intituled by divers, Pliny callethicdras Phanicea Bellouiss Cedrus primitafolys obsufis and Cedrus Phanicea, Matthiolus, Gefrer in borth and Duranu Oxycedrus Lycia, Lobel, Cedrus Phenicea media & alter, Dedoneus Oxycedrus folio Capressi, aus Sabina moje Messe lienssiam (but the same note that I gave to know Iuniper from Cedar which is the Blacke berries, may serveal for Savine, all the forts of them likewife giving blacke berries and not red) Clufins Inniperus major, Lucdusonfis This quart if genus, for which Cinfins doth juftly taxe him for his confident boldnesse to make this and others that beare berries to be Thaja, when as Theophraftus who onely giveth the description thereof 1.3.6.5. to be like the Cypess both in leafe and fruit, the tree being of all writers reckoned inter coniferat, whose fruit as all know is morelike unto a small Cone or Pine Apple, with scales before it open and separaterh then a berry) and the same allow Baubinus thinketh is his first Thuja or Thuja Massiliensium: for both Clusius and he doth note it as a thing fitto be knowne that this Cedrus Phanices while it is young differeth in leafe from it felfe when it is old, and therefore Bankinus in making two forts of them when himfelfe doth acknowledge them to be but one, doth but fill up roome needeleffe. The last Lobel calleth Coders Phenices miner vel terria, and Baubius Cedrus fato Capril mor: The Grecians call the berries of the Cedar tree xides of codrides, and so doe the Launes also The Frank call the second Serbm, and the first Cade as Label faith, and by burning the greene wood after the manner of making Pitch and Tarre doe make a certaine liquor or Tarre which is very fivong and flinking, by them called Hable Cade, but Lugdunes fis taith that the faid Tarre of oyle is made and drawen as well from Iuniper being for or from All or both the Schience of the called th or from Ash. or both the Sabines, or the prickly Cedar as from this. These Cedars also yeeld a certain Game formewhat like unto the Gum of Juniper and brittle also as it is.

The Vertues. The small Cedars as Galen faith are hot and dry almost in the third degree, the berries are sweet as of the format Iuniper, and in like manner are of small nourishment to be earen, yet too liberally taken as Galen faith they cate headach and raife heate and gnawing in the bowells, effecially the two last which doe more heate and sy then the other: the faid berries bruiled and made up with hony cureth the cough, and being boyled in wine and dust provoketh urine belease the Secondary and the cough, and being boyled in wine and dust provoketh urine belease the Secondary and the cough, and being boyled in wine and dust provoketh urine belease the Secondary and the cough, and being boyled in wine and dust provoketh urine belease the Secondary and the secondar provoketh urine, helpeth the Strangury and is effectuall in the diseases of the mother, the inflocations and iraging shereof, to be drunke upon the first, and to be injected when it is exulcerated: it is also given to the interest of the mother. are bitten or flung with Serpents or venemous creatures, especially the Sea Hare : the same also flatch Lister and fluxes of the Belly, and is of good use in Ruptures, Crampes and Convultions, swellings and inflamming and are thought to be no leffe effectuall then Iuniper berries for all the purposes whereanto they are pet, and the to be but a little inferiour to the properties of the great Cedar: for that water which forerunneth the liquid had to Tarre, when the great results a little inferiour to the properties of the great Cedar: for that water which forerunneth the liquid had the contract of the great Cedar. or Tarre, when the greene wood is burned is called Cooria, as well as that which commeth from the

Companie almost as strong and powerfull to condite or enbanlme the bodies of the dead, to preserve them from dis amost as though de cade or abhominable flinking Tarre, is used not onely of the Shepherds to cure their mendion as it the swins and it can be supported to the support of and is nied cyther to at the fame also is effectuall to clerife and dry up watering, corrhoding or creeping the fame also is effectuall to clerife and dry up watering, corrhoding or creeping the fame also upon wood to preferve it from Wormes, and the famell thereof driveth away Mother and other noyforme Flies.

CHAP. XXXII.

Et the blacke thorne or Sloe bush here take up a place, because it is so thicke stored with thornes. It new ter groweth to the greatnesse of a tree but alwayes abideth, as an hedge bush, in some places rising higher then in others, having usually divers stemmes rising from the rootes, branched forth into the greatness of the street with street down the rootes. trarms and smaller sprayes, stored with strong short and sharpe thornes, set with and besides the smaller sprayes, stored with strong short and sharpe thornes, set with and besides the smaller sprayes, stored about the edges: the flowers are very white, many set on the branches. indires places and not wholly at the toppes, confilting of five leaves as all other Plummes and Cherries have, windivers white threads tipt with yellow in the middle, after

which follow the fruit, which are as all know, blacke and fmall when they are ripe, and with the harshnesse a little sweete, but before that time so harsh that none can indure to take them: the are all of one forme, that is round, and of one fize or bigreficin a manner, but to be much bigger or else as big as a Bulleis, ambelong with the roundnesse as a Dampion or other larger Numl did never fee : the roote is great and wooddy spreading under ground and shooting for the agains in divers places if it be not cut and pruined.

The Place.

heweth in everyplace and country, in the hedges and border officids, and is for their devision a fure defence. The Time.

Is floweth early, that is, alwayes in April and fometimes in Cherch, fostrong and hardy it is against all the injuries of the weather, but ripeneth the fruit after all other Plummes what foger, for it is not fully ripe and fit to be eaten and used untill the Assume froits have mellowed it.

The Names. It is called in Greeke nonwalden a zein Coccymelen agris and ejamunumila agriococcymelea quod magritudine & rotunditate minula ferat, and the frut dyelokokkuhndov agriceccymelon: but Colossith that they call it in Afia aguror Prumuum, in Latine. Fram Sylvestris and Pranellus. Virgill quarto Georgicorum calkhit Spinse in the malculine gender in these words,

Et Spinus jam pruna ferentes. And so doth Servine and divers other authors since their times. The Bulleis is accounted a kind of wild Plumme, of the kinds. whereof I have spoken in my former booke. The Italians call it Press falvatice, the French Premier fauvaga, Prunelier and Pilifor the Germaner Schlebendorn and Haber Clehen, the Dusch
Slowdern and wee in Sustific Policies Therefore Store rmand wee in English Blacke Thorne or Sloe tree, or

The Vertues. All the parts of the Sloe buth are binding, cooling and drying, and all effectuall to stay bleedings at the nose or amouth or any

The Blacke thorne or Sloe bush.

otherplace, the Laske of the belly or stomack of the Bloody at de abindance of womens courses, and helpeth to ease the paine in the sides, bowells and guts, that come or much sequering, to drinke the decoction of the barke of the roote, or more usually the decoction of the bries typher fresh or dryed. The Conserve likewise is of very great use and most familiarly taken for the pur-bries typher fresh or dryed. The Conserve likewise is of very great use and most familiarly taken for the pur-bries typher fresh or dryed. The Conserve likewise is of very great use and most familiarly taken for the pur-bries typher fresh or dryed. The Conserve likewise is of very great use and most familiarly taken for the pur-bries typher fresh or dryed. The Conserve likewise is of very great use and most familiarly taken for the pur-bries typher fresh or dryed. The Conserve likewise is of very great use and most familiarly taken for the pur-bries typher fresh or dryed. The hear of a Balmam, is a most certaine remedy tryed and approoved, to ease all manner of gnawings in the marke, the fides heart or bowells, or any other griping paines in any of them, to drinke a small quantitie when the mouth the mouth the leaves also are good to make lotions, to gargle and wash the mouth without, wherein is (Wellings, fores or kernells, and to flay the defluxions of rheume to the eyes or other the sallo to coole the heate and inflammations in them, and to eafe the hot paines of the head, to bathe the foreadditionles therewith. The simple destilled water of the flowers is very effectuall also for the said purposition in the said purposition of the greene betries before they kine in a said of the greene betries before they kine in a said of the greene betries before they kine in a said of the greene betries before they kine in a said of the greene betries before they bineumedalfo for the faid effects of cooling binding and staying the flux of blood and humours, and some Pupples, que findiofe prateree. The juice of the fruit of Sloes is taken as a Substitute for the juice of Acacia and our Apotherarier shoppes, which substitution although it bee not much to be missised, as having one and but 1024

but one qualitie of the Acacia in it which is the binding, yet is it deeper in the degree of cooling the learned men in fundry places and namely the Phifitians of Padea and Naples have accounted the content juyce of Sumach or of Mirtles, to be a better substitute answering to the qualities of the Acasia more than juyce of Sloes doth: for substitutes had neede of much consideration and judgement, not only to be a better substitute answering to the qualities of the Acasia more than juyce of Sloes doth: for substitutes had neede of much consideration and judgement, not only to be a better substitute answering to the qualities of the Acasia more than juyce of some substitute answering to the qualities of the Acasia more than juyce of some substitute answering to the qualities of the Acasia more than juyce of Sloes doth: for substitute answering to the qualities of the Acasia more than juyce of Sloes doth: for substitute answering to the qualities of the Acasia more than juyce of Sloes doth: for substitute answering to the qualities of the Acasia more than juyce of Sloes doth: for substitute answering to the qualities of the Acasia more than juyce of Sloes doth: for substitute answering to the qualities of the Acasia more than juyce of Sloes doth: for substitute answering to the qualities of the Acasia more than juyce of Sloes doth in the Acasia more than juyce of Sloes doth in the Acasia more than juyce of Sloes doth in the Acasia more than juyce of Sloes doth in the Acasia more than juyce of Sloes doth in the Acasia more than juyce of Sloes doth in the Acasia more than juyce of Sloes doth in the Acasia more than juyce of Sloes doth in the Acasia more than juyce of Sloes and Juyc the first qualities, that is a roote for a roote, a feede for a feede, a juyce or gum, for a juyce or agmy to travel a juve or gumme in steede of a roote or seede, or contrariwise: but in the second qualities also dia file. that is in heate and cold, that contraries be not admitted, either of cold for hot, or hot for cold; yea and in the that quality likewife, that they may answere as neere as may be possible, the same degrees that they neither was needed to be a supplied to the same degrees that they neither was needed to be a supplied to the same degrees that they neither was needed to be a supplied to the same degrees that they neither was needed to be a supplied to the same degrees that they neither was needed to be a supplied to the same degrees that they neither was needed to be a supplied to the same degrees that they neither was needed to be a supplied to the same degrees that they neither was needed to be a supplied to the same degrees that they neither was needed to be a supplied to the same degrees that they needed to be a supplied to the same degrees that they needed to be a supplied to the same degrees that they needed to be a supplied to the same degrees that they needed to be a supplied to the same degrees that they need to be a supplied to the same degree to be a supplied to be a supplied to the same degree to be a supplied to be a su abound in any degree. And although Galen did appoint the double quantity of Caffin in the fleed of Chamwhich made Quintum to cast into his dish, that by the same rule he might take double the quantity of contents in the flead of 10 much fine, as was appointed to make a medicine, yet Galens answere to him flandeth god that the respect of substitutes, standeth not in taking twife so much, of that which is worse in stead of the which is good, but as in the actions of men, when as the frength of one man is not sufficient to beare, lift, or more, ftone or engine, we put two or more to doe it: but there are other substitutes admitted among our Apoleurie frome or engine, we put two or more to docter out there are other indicates and interest and one of the interest of the intere led Cortea Winterani) which is the barke of a tree, to be the substitute for Coffen which is a roote, in our men diffensation, when as the like was never seene before, and to deny a genuine and right Simple, to be put into the ther mans composition, because the thing was scant, and not for every one easily to obtaine, nor the pitcher. that every one might have cheape, and therefore in fleade of an aromaticall roline, use an unfilling of to like quite contrary to the rules of Art, the rule of substitutes, and the course of other famous and worthy profitons in other Countries, who by sparing no cost to obtaine such genuine drugges as are rare, scarsely to belied, and yet of especiall use, have made themselves and their compositions famous through the whole world; whereacher by being too greedy of gaine, and too envious of any others better proceedings than their owne, have used, and too, farre meaner things than they should but bold, what hath just anger against the errours in my profision drawne me to utter? it is rather in hope that all will amend being forewarned, than to touch any inparious, that will hereby take himfelfe to be taxed, for thereby he shall shew himfelfe guilty of the crime, although nor doe accuse him.

CHAP. XXXIII.

Tragus five Tragum Matthioli. The Sea prickely plant.

His firagling fellow I have followed to the Sea fide to bring to your view, and have therefore that in the end of this Classis, being necres to this tribe of prickly plants, although it selfe be somewhat

gentle or lesse offensive, whose description is in this manner. It spreadeth divers crooked greene stalkes, variously branched, and the branches foulded one within another, thicke fet with small short, and somewhat sharpe, pale greene leaves, three or foure set together, thicke and clofing the stalke at the bottome, forming as it were a great joynt, relembling the fruite of the Caltrope, in some plants and places the leaves will be twife as long, tut in gardens are never fo sharpe or prickly, as in the natural places; at the jounts upwards stand several small vellowish greene flowers, which afterwards turne into small flat seedes, within a three square prickly huske : the roote is small and long, perishing every year cutterly, so that if it sow not it selfe, as in the naturall places it doth, it must be new sowne every yeare: the whole plant is almost without any take, either of heate, or cold, or drying, yet more enclining to heate than cold, as many fea plants doe.

This plant groweth neere the Sea fide, not onely in other hot Countries where by the heate of the climate, the branches are harder, and the leaves more sharpe and pricking, but on our owne coalts also in divers places, although nothing so sharpe yet somewhat prickly.

The Time. It flowreth not usually untill the middle of Inly, and the feede is ripe in the end of August.

Tragm is modifine diffie, a word of many fignifications, for this is neither the Testy Tragus of Disserides, which he faith some also called Scorpins, nor yet of Pliny which hee maketh the Scorpius of Theophraftus, nor yet the Tragos Corealie, whereof you shall heare further in his place, nor yet the Tragum or Targum vulgare of Clufun, which is our Dis-tander: but a prickly sea plant adjudged by Lobel and others, to be a kinde of Kali, and call it Kali spinosum, which MatTragum Matthioli.
The Sea prickly plant.

TRIBE 9. the festorth for the right Tragm or Scorpins of Diofeorides, but confoundeth it with the Scorpins (or Nepo as the festorth it) of Theophrafius: and therefore all others fince his time call it Tragms, or Tragmm Matthiolical and the state of les unfacethill of a surprise and Line and Others line en time call it Trages, or Trages Mathioli, all trages in Probes Mathiola. Anguilara calleth it Drypu and faith Trages non est: Lobel hath set forth all different lesses, and Camerarius also said in the surprise of all left room in Front standards. and Gamerarius also faith it did grow with him, then Mathiels of Lugarius also faith it did grow with him, then Mathiels of Lugarius for this, yet Lugarius in his Booke of Sea plants giveth a figure differing from the former, viz.

In the standard of Diefering baceful baceful minus or Vua marina minus which has the indicate I have shewed you beusing with leaves in rowers that Common or America out the true tragms of Dioscorides I have shewed you be-itely the name of Polygona bacifera minus or Vua marina minus, which by the judgement of most the exercised historisms doth best agree with Dioscorides text in all points. Bankinus in this as he doth in many other places phranime doth beit agree with Dispersion text in all points. Hambins in this as he doth in many other places and would be been as if they were two plants, calling it Kali fino sum cochlantum and Kafi spinos affinio, and proprieted authors unto each, when as himselfe acknowledged they doe amisse that make them to bee suppopriated authors unto each. I have called it in English the Sea prickly plant untill a fitter can bee store.

The Vertues. lemot fade or learne of any property physicall wheretime this plant is serviceable, (onely Camerarius faith lands usue of realist of a failer herbe to be eaten) but ferveth to contemplate the Creator in his creahand nyoung capus and plants that grow out of the ground, whereof although we know no use in many restalls the use in most, yet he hath not made the least in vaine, and if we would be as industrious to search our yant halls medic in minor, yet he make not make the meant in value; and it we would be as indultrious to learth out he holds as our forefathers have beene in their times we should know much more then we doe; and surely per mana-f weddentenjoy their labours, in what a world of darkeneffe and ignorance should we abide? Let therefore wweaman conjugate of the conjugate of th promises lenthim, not for his owne particular onely, but for the benefit of others, fo shall the savour of such a smoother than the same of others receiving the tent as well farre of as neare at hand, perpetuall odour regule will rule from them and glory will crowne them from whom it commeth.

ICES HERBÆ CAPILLARES

FERNES AND CAPILLARIE HERBES.

> CLASSIS DECIMAL THE TENTH TRIBE.

CHAP. I.

1. Filix mas vulgaris. The common Male Ferne.

F the Male Ferne there is some diversitie as shall be shewed. The Male Fene leader forth divers hard rough unbranched stalkes of winged leaves, naked or bare athelower end, confifting of many leaves up to the toppes with one at the end, feton boblides thereof, not fully opposite but as it were in the middle betweene two on the country side, each leafe not fully devided but deepely nicked in on the edges, all of them of a pale greene colour, hard and dry or without sappe, broadest at the bottome and imblet toward the toppe, on the backe side of whom there are certaine brow-

nish small spots which are the seeds,

for by the falling of them young ones are encreased: this and all other forts of Fernes and Capillarie herbes in this Classis mentioned, have no flowers nor other feeds then such spots, or scales whereby they as I said are encreafed, although many have denyed that any of them have eyther flowers or feede, and some have beene reclaimed upon my inflance of the place in Genefit 1. 11.12. and so have declared it: the roote hereof is made of many thicke blacke threads descending from a browne scaly thicke head.

2. Filix mas aculeata. The prickly Male Ferne. This other Ferne differeth not from the former, but onely that the winged leaves are not dented in, but whole, having a small pricke at the end of each of them and growing not so

The Place.

The first groweth as well on Heathes and open places of hills, as in shadowy places by the sides of fields, reasonable frequent in all countries, but the second groweth . very few yet in the like places alfo.

The Time. These seldome hold their stalkes with leaves greene in the Winter: but shoote out new from the roote in the Spring which at their first rising are brownish and foulded in round : The time when those heads on the backe of them are ripe and doe fall is Midsomer, and falling on the ground doe spring, for whereby else should it be encreased, seeing God in the beginning appointed every herbe and tree to have the feede of their kind (and not of another) within them.

The Names. Greekelingly share all officer, provide and previous; technic the brown are like time the wings of in Rinder in Theriacis calleth it this gov and thins of in Latine Fields mass of most authors; yet Anguitars, Gefind. Rinder in Theriacis callet it this gov and thins of in Latine Fields mass of most authors; yet Anguitars, Gefinder in the Confirmation of the Co water and the contrary and to the best in the fewords, differt famina filix a majorina qued folium unico aren porcetum hac babeau, &c. the in the feword by This in a find it his third for of the male kind, for his fecond species is but a small difference had been a finall difference. the sitte and Santinum in his Prodrome as I take it calleth it by the name of Filix mas aculeate miner, and the min; and the major, for he describe the with little difference. The male Ferne is called by the Arabians, Sa-ton the min security of the Spaniard Meletheyerva, by the French Fongere and Fenchiere maste, by h lishem Felcenseferm, by the Opech Varen manuelen. The Vortnes.

line that all authors have appropriated the same vertues to the male Ferne that they have to the female, and independently a tasted or remember full of the same things againe; I will referre you to the next Chapter for indicensiving a minoring or remaining the mane things agains; I will refer you to the next enabler for the Of the after of Petre is since a kinds of thicke or darke coloured greene glaffe in fundry places in fact, winds Darthy of Mainting. (and in England also as I have beene told by fome) out of which they have the freede which this and the female Ferne doe beare, and to be gathered onely on Midsominstehen wine. The needs wined wine and servicioned realist and to be garnered onely on Midjorninstendingly, with I know not what conjusting words is imperfittionly held by divers, not onely Mounteinstead Queckfalvers, but by other heariest men (yet it cannot be faild but by those that are too superstitionsly
ideal to be of some steere Indeen vertue, but I cannot finds it express what it should be; for Banhinus in mer upon Maribiolius faith, thefe rales are neither fabulous nor superstitious, which he there faith he will payment upon account and in the rates are neutral account in the interest of the printer of the control of the printer of the who in the water (except forme with double flowers which are efferented by the roote) but doe beare feede, &c.,
District relateth a great comtrarietie in nature betweene the Ferme and the Reede, that each one will perifi where the other is planted, as if it were by a natural inflinct, which thing I thinke happeners rather from the fole, a Rede not joying in a dry ground nor the Ferne in a wet. Pliny in his 24. booke and 11. Chapter faith, that the roots of the Reede laid to the Ferne driveth it forth, as the roots of the Ferne in like manner doth the Rende : and Celfon before him sheweth that cach of them is a remedy against the other, and Theophrasism that bewech whereas Corne and other herbes doe delight and are furthered by dung, the Ferne onely perisheth

CHAP, II.

Filix famina. The female Ferne.

Fthe female Ferne likewise there is some diversitie more then formerly hath beene observed by others as you may here fee.

1. Filix famina unlgaris. The common female Ferne.

This Ferne rifeth up with one or two, and iometimes more amofround flatkes from the roote fomewhat higher then the form, and branched with fach like winged leaves growing on both fides therof equally for the most part one against another, my leafthering leffer then the male, and more divided or and yet not there but round pointed, of as strong a smell a the lumin, and histing the like spots on the backside of them, which falke it it be cut a flope formewhat long, will in the white pith thereof thew fome marke of a splayed Eagles the most beyond is long and flenderer then the former, of about the most part creeping un-

Villa famina pinnulia dentalis. Dened female Ferne.

This the senate Perse hath the small winged leaves which wit orestifide of the middle ribbe, formewhat sharpe poinof miles generation and narrower then the former,

and the graving up for first maine traite is ruler of the gravitation har a foote long, threathing out into wings each whereof is sademed bu whole, ending in a small pricke or point.

The Place.

The first groweth more frequently than the male on barren heaths, and shady hedge fider, &c. thenthe grow rather on moist rockes and in the shaded hills.

They flourish at the same time and perish in Winter, I meane the leaves. The Names.

It is cal'ed in Greeke Sanuariete & voucoaraliere thelypterfu and nymphen, pteri in Lating Filly forms; the fill is generally by most anthors called Filix femina, yet Gefner in borris calleth it Ma, and Rad is generally by most antitots cancel at the feecoad is called by Thalim, Filix femina altera templain the late called by Banbinus in his Pinax, Filix ramofa minor pinnulis dentatis, which Cordes in historie called project majoulum, as Thaliss noteth it likewife, it is called in Italian Felce famine, in Spanish Heleche and French Fenger femelle, in high Dutch Groffe Farnkraut, in low Dutch Varen Wiffen, and we in English Brake or common from The Tertmes

The rootes of both thele forts of Ferne are somewhat bitter with some aftriction, being braifed adopted Mede or honyed water, and drunke, killeth both the broade and long wormes in the body; the fameulone the swelling and hardnesse of the spleene: the greene leaves caten, are sayd to open the belly and morehin downewards, yet it troubleth the itomacke, and purgeth chollericke and waterish humours : they are my cagerous to women with childe, by destroying the birth, and provoking abortement, yet is it but a fallow he are danger unto them to goe or stride over its for Lacuna shewerh that the greeke text is failty in that word, which bred that errour; yet the use of it procureth barrennesse in them : the rootes being brailed and boyled in orker Hogs greafe, maketh an oyntment very profitable to heale wounds punctures or prickes in any part and the population of the profitable to heale wounds punctures or prickes in any parts and the population of the profitable profitable to heale wounds punctures or prickes in any parts and the population of the profitable der of them used in fowle Vulcers, dryethup their malignant moisture, and causeth their special ballier to rootes hereof with other things that goe into the oyntment, called Agrippe are appointed as helping bytosite persons: the sum of Ferne being burned driveth away Serpents, Gnats, and other noisome Creamentains Fenny Countries much molest both strangers and inhabitants, that lye in bed in the night time with ther for uncovered. They use in Warwicke shire, above any other Country in this Land, in steed of Sope to wishing clothes, to gather the semale Ferne (for that is most frequent with them) about midsomer and to make up im good big balls, which when they will use them they burne them in the sire, untill it become blewish, which ing then layd by, will diffolve into powder, of it lelfe, like unto Lime : foure of these balles being diffolye in warme water is sufficient to wash a whole bucke full of cloathes.

OT. CHAP. III.

Osmunda regalio sive Filix storida. Osmund or Water Ferne.

Lthough this Ferne, doth never grow naturally but in Bogs, wet Moores, and the like wany places, and therefore may fitly challenge to be placed with those of the like nature: yet because I would not transpose it alone, from the rest of this Tribe, let it take his place here with the rest of the Fane. It shooteth forth in the spring time (for in the winter the leaves perish) divers rough hardfuller halfe round and hollowish or flat on the other side, two foote high, having divers branches

1. Ofmunda regalis five Filis florida. Ofmund or water Ferne. O fmunda regalis fummitatis enw floribu.

TRIBLIO. inclinating recording to all fides, each whereof flanding one against another, are longer narrower and before inclination and the contract of the leaves of Politopoly: from the top of for the falkes, grow to tha long buth of fault and more yellowish greene scaly aglets as it were, set in force the management of the leaves are, which are accounted as the flower and feede: the roote is rough in the finite pith in the middelt which is called the heart thereof.

ligorithas I before fayd on Moores, Bogges, and watery places, in many places of this Land, I tooke a hardered for my garden from the bogge on Hampsteed Heath, not farre from a small cottage there.

lingreene all the Summer, and the roote onely abideth in winter, to shoote forth a new in the Spring. The Names.

his alled in Latine (it both no Greeke name) Ofmundaregalis of the fingular properties therein: it is also in the annual properties therein; it is also industrian or agreement, and as Gefrer faith, Filix Lunaand y mine the super by Chimistes, by Ruelline Sideritie forte, by Anguilara Filix Mas, and by Cordus in historia Finite linguistic and by Cordus in historia Finite linguistic it is called in Italian Osmunda, in French Osmunda and Fengiere agnatique, in high Datch Wasser Frand Groffe Farn, in low Dutch Groote Varen, and Wilt Varen, some in English Osmund Ferne Osmund the wattman, Ofmund royall and S. Christophers herbe. The Vertues.

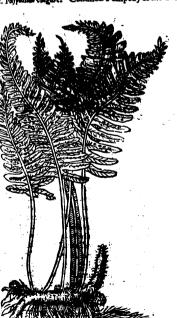

Of months is not particularly remembred by the ancients, although it is probable enough they knew it, and comwhended it under the male Ferne, for Galen commendeth the roote of Ferne to be very profitable, and thereforthelater times added a Royall title unto it, in that it had rather more effectuall vertues than others, and both for inward and outward griefes, as is mentioned in the foregoing Fernes, and is accounted by most to be forgular in woundes, bruifes and the like, the decoction to be drunke or boyled into an oyntment, or oyle, as a Belime or Balme, as also singular good against bruises and broken bones, or out of joyat; and giveth much ease wite Collicke, and Spleneticke diseases, as also for ruptures and burstings.

CHAP. IIII.

1. Polypodium vulgare. Common Pollipodie of the Oake.

(a) Ollipody is a small herbe consisting of nothing but rootes and leaves, having neither stalke nor flower, nor feede, as it is thought. It hath three or foure leaves, rifing from the roote, every one fingly by it felfe, of about an hand length, which are winged, confifting of many small narrow leaves, cut into the middle ribbe, standing on each side of the stalke, each being large below and smaller up to the toppe, very like unto the Ofmund Ferne, not having any dents or notches at all on the edges, 3. Polypodium Iluenfe. Iland Pollipody.

1. Poppedian unigere. Common Pollipody of the Oake.

as the Male Ferne hath, of a fad greene colour on the upper fide and fmooth, but on the underfide fourth as the Male Ferne hath, of a fad greene colour on the upper line and allocate, but on the underlide found rough, by reason of certains yellowish spots, are set thereon; the roote is smaller than ones little fact, a slope or creeping along under the upper crush of the earth, brownsh on the outside and greenish with the control of the careful property of the control of the careful property a flope or creeping along under the upper cruit or the earth, or owners on each fide with certaine fweetish harshnesse in the talke, set with certaine rough knags or excrescences on each fide brooks and some fibres underneath it when the contract of the ving also much mossinesse or yellow hayrinesse upon it, and some fibres underneath it, whereby it and

2. Polypodium alterum seu minu. Small Pollipodye.

This small Polipodye different not from the former, neither in roote or leafe, or markes on the undefice. the leaves, but onely that the roote is smaller, and slenderer, and the leaves also not so long or large, additionally an informal diversity of kinde, says though in some places the leaves may seeme to be a little waved on the edges, yet it is but accidental.

nough in some places the leaves may reeme to be a little waved on the suggest, yet as a calculation.

3. Polypodium Iluense. Illand Polypodie.

The lland Polipodie is rather differing from the other, by the nature of the place (as it is supposed, because the supposed because the su The lland Polipodic is rather differing from the forme from those of other places, thoughness is land of Ilna, bringeth forth many other plants, differing in the forme from those of other places, thoughness is quality) the stalkes rise up sometimes with two or three leaves at a joynt or place, and sometimes but one, some what hayrie at the bottome of them, each lease being about a soute long, whose middle ribbe is of thatis.

browne colour, the leaves, or rather the divisions or parts of the leafe, are more separated one from another. not standing close together as in the former, but distant unequally on both sides, each part also being longer and dented on the edges, of a greene colour, and smooth on the upper fide, and spotted with a yellowish dust on the underside, as the former are; the roote is like the other.

4. Polypodium Indicum. Indian Polypody. Clusius fetteth forth this in the fourth booke of his Exercises, being brought out of the East Indies, the certaine place not knowne, by on Doctor Cole, who dying in comming home, his Paper booke of herbes came to Clusius his hands, where he found this among the other without name. The roote he faith was halfe a foote long and an inch thicke almost, rugged browne and long like other Pollipody; it had three large leaves rifing together from it, two of them bigger than the other, and of eleven inches a peece, with a great middle ribbe, and each fide of it contained five inches in bredth, the edges much divided, and many veines therein. This I thought good to mention here although it is likely it will never grow in these Countries, and to shew the diversities of

The Place.

Polypodie groweth as well upon old rotten trunkes or stumpes of trees, be it Oake, Beech, Hasell, Willow, or any other, as in the woods under them, and upon old Mudde walls, as also in mossie, stony, and gravelly places, neere unto woods; the larger groweth where it buth most mellow moyst cartly to spring in, and the slenderer where the place is dry and hard: the best is accounted that which groweth upon Oakes onely, but the quantity thereof is scarce sufficient for the generall use: the other as is tayd groweth in the Isle Ilua which is in the Mediterranean fea, the last in India.

The Time.

It being alwayes greene, and bearing neither flower nor feede, as it is thought it may be gathered for use at any time, yet it shooteth forth greene leaves onely in the spring.

The Names.

It is called in Greeke modumos ? Polypodium so called a polyporum cirrhis saith Dioscorides, a cavernosis actabalis cen cirrhis polyporum faith Pliny, & Filicula quasi parva filix and in Latine Filicularis herba, Cato hath it Felicula; of the Arabians Bifbera fo hath Serapio, and Defbers & Budeig by Avicen, yet others fet it down Aibeig and Befant of the Italians Polypodio, of the Spaniards Filipodio, and Polipoio, of the French Polipode, of the Germani English Dropffmurtz and Bannsfarm, of the Dutch men Boomvaren: in English Oake Ferne, and Wall Ferne, exceeding to their places of growth, but generally Polypodie. The first is generally called Polypodium of all writers, and thought by Lobel to be the Herba Radioli of Apuleim: the second Matthiolm calleth Polypodium alterna, and Dadoneus Polypodium mineral. Dodoneus Polypodium minus: the third Lugdunenfis fetteth forth, with the name Polypodium Iluenfe; which Banks mu thinketh to be the same, which he settent forth under the name of Louchitis affers Ilmensis, and yet Loubnengis in the description of the Polypodism Humis, airt that the Hand of Jims, bringing forth many frame rat plants, as this Polypody, a Lonchitu appera, and an Hemionitis that doe differ from others forth the that faw them and fet them forth, faith that they are divers plants, and that it hath the fame qualities that the other Polypois hath, but Lonchitis after a hath no purging quality; but Bashirss in fo faying shewith that he never saw theiring plants, but the effigies onely, and I thinke the figure of the roote if it be truely set forth, shewith the muth of the matter of the roote if it be truely set forth, shewith the muth of the matter of the roote if it be truely set forth, shewith the muth of the matter of the roote if it be truely set forth, shewith the muth of the matter of the roote if it be truely set forth, shewith the muth of the matter of the roote if it be truely set forth, shewith the muth of the matter of the roote if it be truely set forth, shewith the muth of the matter, for that the one is long and thicke, like unto other Polypodies, and the reote of the Lonchitis is firingis.

4. Polypodium Indicum. Indian Polypody.

The Vertues.

My die is generally used with other opening and mollifying things, to purge the body, for it is held by add start Physicians to be very weake of it selfe. Mefees who is called the Phisitions Evangelist for the add start of the opinions saith, that it dryeth up thinne, humours, digesteth the wind purgeth blacke or burnecholler. and of pecially to to be and chick for the self of the opinions. the structure of the control of the rea from the joyntal white the decoction of Polypody agood while together are freed from these tumors melanting, who by a superior wherewith they are much troubled), and is therefore good for those are the bands, feete, knees and joynes wherewith they are much troubled), and is therefore good for those are build with Melancholy or Quartaine Agues, especially if it be taken in Whey or Mede, that is honied was an in the broth of a Chicken with Epithymans or with Beetes and Mallowes, it is also good the bands of the country of the choling of the country of the choling of the country of the choling of the chol the highest of the opicines, and to those pressings or that the start happen in the lines, as alto for the chol-kepimany manner of wayes, some use also to put to it some seedes of Fennell, and Anise or Ginger, to correct strum any manner of wayes, tome use allo to put to it fome feedes of Fennell, and Anife or Ginger, to correct to safe, or loathing that he faith it bringeth to the from acke, and to firengthen it, the better, yet fome hold it is fine danger that it bringeth no trouble to the flomacke, but is a fafe and gentle medicine, fit for all fas form the danger that it bringeth no trouble to the flomacke, but is a fafe and gentle medicine, fit for all fas form the danger that it bringeth is and yet a greater quantitie may be given in a decoction then appoint the same or more, if there be not Sene or fome other strong purger put with it: a dramme or same the powder of the dryed rootes taken safting in a cup full of honyed water, worketh gently as safe as a fasting to the safe purposes aforesaid. The distilled water both of rootes and leaves is much commended for the safe are safe as a safe against Melancholus and fastafull or strouble for water both or rootes and teaves is much commended for rootes and teaves is much commended for semine Agus, to be taken many dayes together, as also against Melancholy, and searfull or troublesome spound features; and with some Sugar Candy dissolved therein against all the ill affects of the Lungs, as the betweenes; and when tonic sugar Candy distorted therein against an one marcets of the Lungs, as the last homesse of breath and wheelings, and those thinne distillations of the une upon the Lungs, which of amount into a Consumption or Tificke. Some commend the salt made thereof to be mixed with the water; minimum a containing of the Pollypody made with wine, or the rootes themselves rather as I thinke given which the decoction of the Plague or Pestilence, whereunto they are subject by purging them there who were the property of the purging them there who were the property of the purging them there who were the property of the purging them there who were the property of the purging them there who were the property of the purging them there who were the property of the purging them there who were the property of the purging them there who were the property of the purging them there where the property of the property o m, which thing without doubt is effected as hee (aith). by the purging of flegme, where with they are most which the fresh rootes beaten small, or some in the stead thereof take them dry in powder, mixed with madappled to the joynts of any member or part out of his place doth much helpe it : applyed also to the be combine disease called Polypus, which is a prece of field growing therein, that by time and sufferance the probable passage of breath through that nostrill; it helpeth also those clefts or chappes, that happen to come matthe fingers of the hands or toes of the feete,

CHAP. V.
Dryopteris. Oake Ferne.

Fibe Oake Fernes there are two forts, one fet forth by Lobel, the other by Dodonem, whereof I meane to entreate in this Chapter.

1. Dryopteris repens. Creeping Oake Ferne.
This small Ferne sendeth forth divers stender blackish stalkes little more then halfe a foote high, bearing many small winged leaves each against the other, somewhat like unto those of the semales me but much smaller and finer, and of a darkish greene colour, the backefide of whom have not browne but

he foreonthem fer in a double row, as Lobel faith which beneation not: the roote is small and blackish creeping with divers small blacke firegowing from them, and are formewhat like unto the rootes blypody but much smaller and flenderer, of a more austere whand flipticke talte then Pollypody.

1. Drysperia alba. White Oake Ferne.

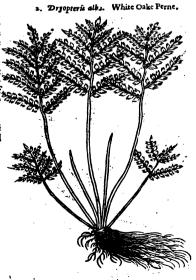

liater Fene groweth not much higher then the former, but the start broader shorter & more deepely cut in on the edand of a paler, greene colour, sported also on the backfide of malkennto the male Ferne a the roote is composed of many this threads or fibres issuing from a thicke roote.

The Place.

loubless form grow in the shadowey thicke woods on the transmit, and formetimes in the open valleyes neare them, and mines also out of the mosse of old bushes and other trees.

Opping for Fills querus repins. Creeping Oake Ferne.

The Time.

They both loose their leaves in Winter and spring up a fresh late in the Spring.

It is called in Greeke Aguariagi: Dryopteris, that is Filix querna, yet Oribafin calleth it bywalagi Brymnig. It is called in Greeke Aporting Dryopters, that is I nex queron, yet or the first is simply called Dryopters of the growing among the Mosse on trees, the first is simply called Dryopters of the growing among the Mosse on trees, and Pterion femina by the same of the growing the Mosse of the growing th Filix muscola, Monte rerne or the growing among the mone on these, and Pterion famine by Code, Matthioliu, Gesner and others; Proposes five Filix arborea by Tragus, and Pterion famine by Code. bel, Matthoum, Gener and others; Irroprerse pro Frix according to James by Code; first Booke and eighteenth Chapter, and so also by Thatiss in Harrynia files to but is not the Filix problem. first Booke and eighteenth Chapter, and to also by a second all though it feeme to bee like it for the next Chapter fave one, although it feeme to bee like it for the next Chapter fave one, and as I shall show you in the next Chapter fave one, and as I shall ship it is the next Chapter fave one. from of Cinjust as I that thew you in the next Chapter rave one, although it wells to be like it for the their difference. The other is called Dryopteric candida by Dodoneus, and as Lobel faithis the Aalbum Pliny, and of the Shoppes also: by Banhinus Pilicula fontana major five Adiantum filicula folio. The Vertues.

The first as Lobel faith was in former times nied by the Apothecaries beyond Sea, in stead of Pollypody as The first as Lovel 1ath was in former times are by the repetitions to forbeare it and use any other, but rating knowing a righter, neither were they shewed by their Physicians to forbeare it and use any other, but rating knowing a righter, neyther were they inewed by their rhythtons to fay, that in flead of a purping only pointed by them fo to do, which as he faith some affirmed Rondelessus to fay, that in flead of a purping only pointed by them fo to do, which as he faith some of his factor parients; it is a temedy to the pointed by them to to do, which as no laith tome affirmed Romanies to Lay, that its lead or a purging only per to Pollypody it had a pernitious operation in forme of his ficke patients: it is a remedy to take away barra Treofeorides (aith, if the rootes and leaves bee bruifed together and applyed after freezing, Mathialas light the The forder latth, it the rootes and leaves decorated and approve and approve the wormes. The other fortimoders the rootes in powder with a little falt and Branne is given to Horfees for the wormes. The other fortimoders the rootes in powder with a little last and Drainie is given to Flories to: the wollies and therefore may fafely be used in stead of the true Adianium or Maidenbur, as is usual now a dayes. Label faith that the last forts was fafely used in the Apothecaries shoppes of divences. tries for Adiantum album and nigrum.

CHAP. VI.

Lanchitie afpera. Rough Splenewort.

F these Spleneworts there are divers forts described by divers authors as shall be shewed, and fellow the greater kinde of Matthiolus.

1. Lonchitic aspera major Matthioli. The greater rough Splenewort.

This greater Splenewort hath divers stalkes of leaves somewhat like unto Miltwast but have unto Pollypody, about a spanne long cut on both sides with uneven divisions, dented about the edges with shap points, and rough on both sides without such spots on the backes of them as Pollypody and Miltwase have the toote is composed of many reddish strings or fibres like as Harts tongue is

2. Lonchitis aftere miner. The smaller rough Splenewort.

The lesser Spleenewort is somewhat like unto the former, but that the divided leaves set on each side of the fost brownish stalkes are narrower and longer, each separated from other, but not fully to the middle ribbe: in

. Lonchitu ofper amajor Matthioli. The greatet rough Splenewort.

2. Lonchità affer a minor.

traidle of those outer leaves, rise up other bigger and wher falkes of narrower leaves, like unto them, but bedre takes or instrument across and on the edges that the feme unled with brownift foots, or feales on the period them as in other Fernes: the roote hath a thicke described with scales, lying one upon another, with di-There is another of this fort leffer than foundabout Colchester in Esex, and in other places, aging in the wet borders of fields, and by the hedge

3. Linchitis afpera Marantha. Bastard rough Spleneworte.

This ballard Splene wort hath browne rough stalkes 2 failing, with winged leaves on them, fomewhat like unbut thicker and greater, by much smeanthe upperfide, and spotted with browne rough foleoute other, like Milt-wast, the roote is small, commied of many long fibres.

4. Louchitis aftera Ilvenfis. Island rough Splene worte.

This small Spienewort hath browne stalkes, little above his foote long with leaves fet opposite one to another, wheth cut in on the edges, but not fo deepely as the laft, generation in out the coges out not to decepty as the last, generation the upperfide, and rough with browne scales or affor the under: the roote is a small bush of blackish

The Place and Time.

Thefirst groweth in the moist Moores of Italy, the second mithird, in moyft groves both there and in Germany, and inforeplaces with us, if my memory faile me not : the left in the fland of Ilua which is in the Thirohene sea, and fowrished when others doe.

The Greek name from Diefcorides is AOYN THE ETTER HITERX FIL ad to in Latine Lonchitis altera five aftera, for his first Luchitis is scarse knowne: The first is the Lonchitis aftera wirrof Mattholus and others, or Louchitis aftern minor of Mathiolus, by Tragus Aftlenum filvestre, Cordus and Tuliu Struthiopteris, as if you would say the Estridges

Imsforthe fine wings of the middle leaves, by Clufius Lonchitis altera Nestericorum, this is called Fore Imany places of this Land: the third is the Lonchitis Maranthe, or altera Maranthe by Clufius and others, nd Mathielm Pfeudolonchitis (Maranthe: the last is remembred by Lugdunensis, but Bauhinus as I sayd before intechapter of Pollipodye, first confoundeth the Pollypodium Ilvense of Lugdunensis, with his Lonchitis asserts longir, making them to be both one plant, and againe maketh the Lonchies Maranihe to be one with the Londiss affera Ilvenfis and differing but in greatnesse which I am verily perswaded, differeth from it, although it ime fomewhat to refemble it.

The Vertues.

The dryed leaves of this taken in Vinegar, is held to be good to diffolve the hardnesse of the Spleene, and the some kaves to be singular good for wounds, and to keepe them from inflammations.

CHAP. VII.

Filix Saxatilis, Small or Stone Ferne,

He small or Stone Ferne also have some diversities as here shall be shewed.

1. Filix pumila faxatilis prima Clufij. The first small Stone Ferne of Clufius. This first final Ferne hath a long blacke and slender roots, creeping and spreading a slope, under ground, with a few slender hard fibres thereat, from whence spring divers stalkes a foote high branded into fundry divided leaves, like unto Female Ferne, but much lesse, more finely divided, and farre tenderer addicate than they, and spotted on the backe of them like other Fernes.

2. Filix pumila faxatilis altera Clufi. The fectord Stone Ferne of Clufium.

This other small Ferne hath divers straight round stalkes, greene at the first, but blackish being full growne, about his blackish hooring forth leaves from the middle upwards, with divisions on both sides, like unboth blackish. hate Male Ferne, but much lesse and finer, spotted on the backe of them as the former: the roote from a head ich site Male Ferne hath, sendeth forth many blacke heads, threads, or fibres.

3. Filix faxatilu foliu non ferratis. Small Stone Ferne with whole leaves. This small and groweth somewhat like the Male Ferne, but the leaves are not dented, but whole like unto the water Ferne.

3. Lonchith Afters Maranthe.
Bastard rough Splene wort.

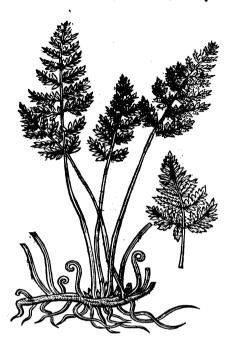

Altera mi-

TRIBE 10.

1. 2. Faix pamila faxatalia prima & fecundac luft. The first and second stone Ferne of Cinsus.

5. Filin fanatilis bassifera Americans.
Berry bearing Ferne of America.

4. Filix faxatilit crispa. Small curled Stone Ferne.
This small curld Ferne hath a roote composed of many blackish threds or fibres, growing from above, where ipring up imall ftall es, scarce an hand breadth high, set on both fides with tender soft strings of very small leave to finely divided and dented, that they feeme curld, of a darke greene colour upwards, and paler below towards the bottome, having redish or brownish dust-like spots on the backesides as the Miltwaste hath, the signrehend

the bottome, having regish or prownish dust-like spots on the packetines as the strict and single size by chance left out, you shall finde it in the Appendix.

5. Filix factarish baccefers. Berry bearing Ferne of America.

This Ferne of America riseth up with fundry long, round, hard stakes of winged leaves, each least consiling of many parts as it were, or cut in deepely on both edges into many divisions, and of a fresh greene colon, having in fundry places, all along of the middle rib on the backe side of them, small round seede like berries key. greene at the first, but blacke and sweetish being ripe, which then are so easily gathered that a small couch with the hand, or the shaking of the stalkes with the winde, will cause them to fall on the ground, where the will soone take roote and grow: the roote is composed of many browne fibres, somewhat harsh in talle: the laves dye downe at the end of Autumene, and spring up new in April, the berries being ripe about Saint Imer tide.

6. Filicula fontana. Small rocke Ferne.

This small Ferne groweth low, bushing with many very small and darke greene leaves, relembling the common fort, but much lesse than any of those before.

7. Chame filix marina Anglica. The small English Sea Ferne. This small Sea Terne from a thicke brownish roote, composed of a multitude of threads, rise diverse bright thining blackish stalkes, two or three inches high, whereon are placed many rough, thicke, thining, blackish, greene leaves, after the manner of the Male Ferne, finely fnipt about the edges, and with brownish make on the backe of them as other Fernes have.

8. Filix faxatilis Tragi. Naked ftone Ferne.
This ftone Ferne from a thicke tufted roote, fendeth forth many hard and rough stalkes, have or naked without leaves, with some spots on them as other Fernes have, and onely fothed at the toppes, into two or three short parts, bowing or bending downe their heads, it agreeth, faith Tragus, with Ferne in smell and talle.

These all doe grow in rockey and stony places, and the fixt, seaventh, and eighth kinds as Lebel such near the fea in Cornewall, in mouth rockie places.

They flower with the rest of the Fernes.

7. Filly marine Anglice. The [mail Inglife Sea Ferme.

8. Filis faxatilà Tragi. Naked front Ferne.

The first here set downe, is the first Filix pumila saxailie of Cluston, according to his description, but the setond figure doth answere thereunto, and not the first, as you may observe by the creeping rootes in the second ficonfigure deth aniwere theretunto, and not the init, as you may observe by the creeping rootes in the second argor, which that onely regarded the figure, and doth not compare the description therewith, may soone begoes decived, and this transposition Banhings observed well, although he doth not speake of it, but onely entitule the if like sastilis romes a significant and questioneth if it be not the Filicula candida of Gener in appendice these ones the tecond is the second of Clussius by the former name, and by Banhings it is save in the more many in a maching multiple of the most the Filicula saxatilis of Camerarism; but the first figure in Clussius set forth lite the female branched Ferne : the third is the third Filix petrea famina of Tabermontanus, and called by Banhim as it is in the title; the fourth is the Filix (axatilis cristia of Pona, in the description of Mount Baldus; the. fifth mentioned by Cornutas among his Canada plants, which Mr. John Tradescant the younger, brought home with imfrom Virginia, this pretent years; 16, 8. prefently after the death of his father: the fix is the Filiania future of Tabermontanus; the seventh is the Chame filix matina Anglica of Lobel; and the last is the Folostium atrum of Lobel, and the Holostium petraling of Tabermontanus, Tragus calleth it Filix unda sive saxatilis, and Thing Missibum are super for furcatum, and Baubinus therenon Filix faxatilis corniculate but why he should referred to the Musicus corniculation of Tabermontan and Gerard, being different plants I know not.

The Vertues. The faculties of these Fernes may be referred to the former.

CHAP. VIII.

Asplenum five Ceserach. Smooth Splene worte, or Milt-walte.

He smooth Splenewort (I so call it in regard of the former which is rough) from a blacke thready and buffly roote, fendeth forth many long fingle leaves, cut in on both fides, into round dents, even almost to the middle ribbe, which is not so hard as that of Pollipodye, each division being not always set opposite unto the other, but betweene each, smooth and of a light greene on the upperside, and with a darke yellowish roughnesse on the backe, foulding or rowling it fells inward, at the filpinging up, as many other Fernes doe, and therein resembleth that Beare Worme that anglers u.e.

The Place and Time. agrowed as well upon frone walls, as moyft and fandowie places, in many places of this Land, as about Brihe, and other the West parts plentifully, as also on Framingham Castle, on Beckensfeld Church in Barkeshire, Sind in Kent, and else where, and like Pollipody, abideth greene in the winter.

TRIBE 10.

Phyllitis laciniate.

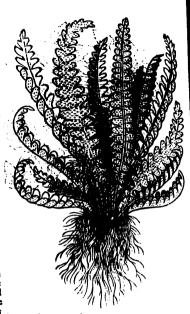

The Names.

It is called in Greeke donknow and onknow Aplenum and Splenium qued flenem juvat, which it holdeth also in Latine, in Greeke also συσλοπίνθειου, Scolopendrium, & Scolopendra in Latine from the likenesse of the Worme so called as I savd before: Theophraftus calleth it which and not where as it is in the vulgar copies, as also mulitar Hemionum which Galen translateth Maia herea in the Apothecaries shoppes Ceterach from the Arabians, in the Antidornium Bononiens it is called Digiti cirrini the Apothecaries and Physicions in former times held the Harts-tongue to be the true Scolopendrium of the ancients, but that errour is now infliciently manifelted and left, as their also who held formerly that Aflenum was not Ceterach: it is talled of the later Arabians and Moores Scolofendrium of the Italians Affleno and Scolopendria, and berba inodorata, of the Spaniaria Doradilha, of the French Ceterac, of the Germanes Stepnson, of the Dutch Steenwares and Milteruit, in English Spleenewore, Miltwast and Scale-

The Vertues.

It was and is generally used against the infirmities of the Spleene, and as Viernevius faith, the Swine in Candy where it grew by feeding thereon were found to be without Spleenes, when as others that did not eate thereof had them as the reft; it helpeth the Strangury or piffing by droppes, and wasteth the Stone in the Bladder, and is good against the Yellow Jaun-dies and the hicket: but the use of it in women hindereth conception. Matthirlus faith that if a dramme of the dust that is on the backe of the leaves, be mixed with halfe a dram of Amber in powder, and taken with the juice of Purslane or Plantaine it will helpe the running of the Raines speedily, and that the herbe and roote being boyled and taken helpeth all melancholicke diseases, and those especially which rise from the French disease. Camerarius saith that the distilled water thereof being drunke is very effectuall against the Stone both in the Reines and Bladder; and that the Lye that is

Smooth Spiceties or Miles ale

made of the after thereof being drunke for fome time together helpeth Spleneticke perfons: it is used in outward

remedies also for the same purpose.

CHAP. IX.

1. Phyllitin feve Lingua Cervina vulgaria. Ordinary Harts- tongue.

TV r ordinary Harts-tongue hath divers leaves rifing from the roote. every one severall, which as the last and other Fernes fold themselves in the first pringing and spreading, when they are full growne are about a foote long, smooth and greene above but

hard or with little sappe in them, and straked on the backe atwhart, on both fides of the middle ribbe, with small and fomewhat long brownish markes, the bottomes of the leaves are a little bowed on each fide of the middle ribbe, fomewhat narrow with the length, and somewhat small at the end: the roote is of many blacke threads foulded or interlaced together. Some doe make two forts hereof, and diftinguish them into

latifolia and angultifolia.
2. Phyllicia laciniata. Iagged Harts-tongue.
This Harts different in no other thing, from the former then in the division of the toppes of the leaves which are diversly as it were torne or jagged, some leaves much and some little, according to the place of growing and time of abiding.

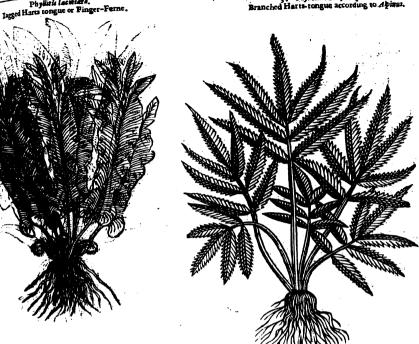

3. Phyllitis ramola Alpino.

Branched Harts-tongue according to Alpinus, The rootes hereof are fomewhat wooddy with the blacke fibres thereat, shooting forth many flender-broad stalker, of leaves two cubits long, a little downy at the bottome, divided into many long and narrow leaves, dented about the ties, fet one against another with an odde one at the end, each relembling the heads of a Iaveling, marked thicke with straight lines

E. PhyRich five Ling a Cervina vargara. Orannary H res-rongu

Phylitis ramofa A'Piso. Branched Harts-tongue according to Apinus.

onbothst es unto the middle ribbe : the whole plant is without sent, but of an austere taste, conteining some bene which is not presently felt but continueth long. The Place and Time.

They are greene all the Winter but spring new leaves every yeare.

It is called in Greeke out fine Phyllitis quaft foliofa, in Latine also Phyllitis and Lingua cervina, and in former times in the Apothecaries shoppes Scolopendrium, as I said in the foregoing Chapter: in all other Europian Dialettithey follow the Latine name; wee in English call the former Harts-tongue, and the other lagged Hartstongue and Finger Ferne, in some places Gerard calleth it Finger Harts-tongue; the last is onely remembred by Alpinus lib de exercice by the name of Phyllitie ramofa,

Hatt-rongue is much commended against the hardnesse and stoppings of the Spleene and Liver also, and spinkthe heate of the Liver and Stomacke, it is very good likewife against Laskes and the Blooddy flix: direnderallo commend the distilled water thereof to bee taken against the passions of the heart, and to stay the hides, and to helpe the falling of the Pallate, to stay the bleeding of the gums if the mouth be gargled therewith, Disfarides faith it is good against the Iting or bitings of Serpents.

CHAP. X.

Hemionita. Mules Ferne.

Here is some varietie in this plant as in the former, and although some doe conjoyne them, yet for the diversitie of their forme I have thought good to separate them.

bile Moone on each fide of the middle ribe, and the strakes on the backe of them are more as lope.

2. Hemionitie altera feu minor. The leffer Mules Perne. Libel faith that he found on Saint Vincents Rocke not farre from Briston in a hollow cave or hole, a smaller liste bereof whose leaves exteeded not the breadth of three fingers, not hard nor rough but smooth and gentle,

and without any markes on the backfide of them, yet with a hollow roundnesse at the bottome of them as the former, and besides somewhat unevenly dented about the edges ; the roots were very small and threaddy quickly withering. Classus faith that Lobel having fent him some of those plants, after hee had kept them in a pot because of their tendernesse, two yeares they changed their forme into the jagged Harts-horne, whereof he much mervailed, for afterwards ashe (aith when he came into England, hee gathered with his owne hands in the fame place the like plants, which there held the forme of Hemiowit.s.

3. Hemienicus peregrina Classi;
Strange Mules Ferne.
This differeth from the first in no other thing but in the bottomes of the leaves, which have a small care or peece of leafe fer on each fide of the arched or hollowed bottomes.

4. Hemionitis Ilvenfis Dalechampy multifido folio. Mules Ferne with divided leaves.

This kinde of Hemionitis (if it pertains thereto) hath fundry stalkes of leaves, rising from a tuft of blacke that haires or fibresseach whereof is about a foote long, divided into feven or nine parts, two or three couple standing lowest, one set against another, and the three uppermost a little riting above them, each of these seaves are long narrow and pointed, and somewhat dented about the edges with an eminent middle ribbe: these have no markes on the backes of them as the others of this kinde have.

The Place and Time.

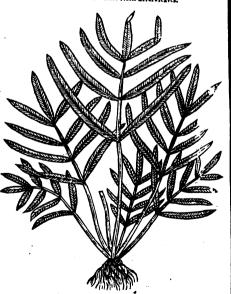

The naturall places of all these are shadowy rockes and moist hollow places where little heate of Sunne commeth, and are greene all the yeare as the former Harts-tongue.

The Names.

It is called in Greek imofine Hemionitu & onthivor Splenium, the former quasi mularia and Splenium voiunt qued ejus folium medicorum (plenia, nimirum oblongas plugulas figura imitetur. The

3. Hemionitis peregrina Ciufij. Strange Mules Ferne.

Hemionitis Ilvenfis Dalechampij maltifilo folio. Mules Ferne with divers leaves.

shirefled valgarie by Banbinus and vera by Clusius; the second is called by Lobel Hemionitis five sterilia, and this care was a superior of the state of the by Lastonerus Lacourage of the Community pergrand of Civiling Lober Dodoness and others for them; the last as Lugdenen for faith growing in the Hand called Ilva, was called of certaine Herbaritts Hemimit thera Dalechampi. The Vertues.

Risespecially good for the Spleene and may fitly be used in the stead of the Harts-tongue going before to all deples it ferveth for .

CHAP. XI.

Adimibum. Maidenhaire.

Here be divers herbes accounted to be Maidenhaires by divers puthors, one whereof I have fet forth anto you before by the name of Dryopteris candida Dodonei, which is most usuall in the higher and lower Germany and with us : fome others I shall shew you in this Chapter and the rest in the tol-

1. Adianthum verum sen Capillus Veneris verus. The true Maidenhaire. Theme Maidenhaire according to Dieferrides his description is a fine small low herbe not above a span high, whitefalkes are smaller, fact, redder and more shining then those of Trichomanes or our common English Maiwhite, whereon are placed delicate fine leaves without order on both fides one above another, tomewhat occurre, whatever leaves of Coriander, or like the leaves of Anife but larger, cut in unequally on the edges and formion the backe with very small browne markes scarse to bee differenced, the roote is a number of blackish howne threads.

2. Adianthum nigrum vulgare. Common blacke Maidenhaire. This Maidenhaire differeth little or nothing from the Driopters (or rather Omopreris) candida Dodonei, fet forhin the Chapter of Dryopter is before, but that the stalkes of this are blacker, and the leaves of a sadder greene, whrea that is greener and paler, fo that eyther that might fitly be joyned to this or this or that, the rest of the description needeth not agains to be repeated.

3. Advanthum fratico um Americanum. Forraine or strange Maidenhaire.

This strange Maiden haire groweth up like unto a Ferne, with a stender blackish browne stalke branched forth impoints, where abouts on each fide frand from 12. to 20, fresh greene leaves, small and somewhat long joyned together by their small footestalke, fomewhat like unto the first true Maidenhaire, but cut in on the outside at

anthum verum sen Capillus Veneris verus. The true Maidenhaire,

2. Adianthum nigrum vulgare.
Common blacke Maidenhaire.

3. Adiantum fraticofum Americanum Forraigne or strange Maidenhaire.

4. Ruta Olemarin five Salvia vine. Wall Rue.

the toppes of the leaves onely and not at the bottome. One very like unto this if it be not the fame hath M. lolm Tradescant the younger brought out of Virginia presently upon the death of his father, whose long stakes have many fine fresh greene leaves a little dented or cut in on the one side and plaine on the other, spotted underneuth with browne speckes.

4. Rutamuraria five Salvia vita. Wall-Rue, or ordinary white Maidenhaire,
This small herbe is generally accounted one of the Capillarie herbes or Maidenhaires, and that not of the last account. I must therefore joyne it unto them with this description : it hath very fine pale greene stalkes almost a fine as haires, fet confusedly with divers pale greene leaves on very short footestalkes, somewhat neareunto the colour of garden Rue, and not differing much in forme but somewhat more like unto the true Adianthm being more and more diverily cut in on the edges and thicker, smooth on the upper part and spotted finely on

The Place and Time.

All these sorts grow both upon stone walls and by the sides of Rockes or gravelly Springs, and other shadowy and moist places : the first in no place so plentifulty as Pena and Lobel say then about Mompelier in Narbone of France; some have reported that it is found in Glocestersbire : the last is found in many places of this Land, as at Dartford, and the bridge at Afbford in Kent, at Beckonsfield in Buckingbamfbire, at Wolley in Huntingtonfire, on Franimingham Castle in Suffolke, on the Church walk at Mayfield in Suffex, and on the Rockes neare Weston su per mare in Sommerfetshire, and are greene in Winter as well as Summer.

The 2N ames. It is caled in Greeke, A'Siartor Adiantum, quod & Staire tou in aquis non madescat, the leafe is not wetted with weter (which by tryall is found untrue) but Nicander his Greeke verses doth shew rather, that the raine resemble on them, which rendred in Latine are thus,

Impollutum Adiantum quod denso imbre cadente. Destillans tenuje folis non insidet humar

Dioscorides calleth it also mairezos Polytrichum, quasi multicomum, quod capillos multos & densos faciat. Apilim Callitrichon quasi pulchricomum, quad capillos iingis pulchrioresque reddie : it is called also Capillus Ueneru in latine, a speciosi reddendus capillus : and by divers other names as Cincinnalis Terre capillus. Supercissum terre & Cinisa. The first is called Adiantum by Mattholm and many others, and although some give another figure and trible it Syriacum, yet it is but one and the fame herbe, and species, though somewhat larger, in that country, Land calleth it Capillus vene ris verus, and Cordus on Dioscorides Adiantum nigrum; the second is the Onopteris signa Dedonei and Adiantum pulchrum Lugdunensi simile of Thalise : the third Bauhinus hath mentioned in his Producent the last Trague calleth Capillus Venerie, and Brunfelfius Saxifrega and of odoth Fuebfius. Mathistus fist clied it Rutamuraria, and afterwards tooke it to bee Parenychia Dioscoridie, Cordue calleth it Adansmalina, THE 10. Dence Rusamiring, and Lower and Lugdenenges Salvin vite, and many call it Adiantum album, white Midenhaire.

The Vietsmesant int.

Midenhaire is of fingular good use against the diseases of the Breast the Liver and Reines especially, yet much histenbare is or might a goodton of the herbe drunke helpeth shofe that are troubled with the Cough, thortordining to others: the decoction or the netter ordinate neighborhand are troubled with the Cough, shorteffe ofbreath, the yellow laundies, the difeases of the Spleanes, thopping of arine, helpath exceedingly to breake
set some, provoketh womens courses and stayeth both bleedings and shortes of the stomacks and belly, especially
whether the is dry for being greene by the thinnesse of the parts, it looseneth the belly, and causeth cholies
whether the set of the stomacks and Liver, and by freeing the stomacks by spiriting it out wonsuffigure to be voyed both from the Stomacks and Liver, and by freeing the somacks by spiriting it out wonsuffigure to be voyed by the story and by rectifying the liver and Blood sufficient and suffi suffigue to be voyued both from the obtained and Liver and Blood caufeth a good colour to the whole body, defiely denfeth the Lungs, and by rectifying the Liver and Blood caufeth a good colour to the whole body, and typelleth those diseases that breede by the obstructions of the Liver or Splease: it is also faid to resist and to and experiences of venemous creatures: the herbe boiled in oyle of Camomili diffolyeth knots, alayeth swellings addition moult Vicers, the Lye made thereof is singular good to clense the head from scurfe, and eyther dry graming fores, stayeth the falling or shedding of the haire, and causeth them to grow thicke, saire, and well dourd, for which purpose some boyle it in wine, putting some smalledge seeds thereto, and afterwards some COLOR OF THE Wall Rue is held by those of judgement and experience to bee as effectuall a Capillarie herbe as any of the fame temperature, and therefore both boldly and fafely nie it in the stead of any of the whenever, or any of the when is for experience bath shewed that it is very effectuall for the cough and diseases of the obt that is not at name a row experience many lie were that it is very enterman, for the cough and dileafes of the large, for the flooping of the Vrine and to breake and expell the Stone and therefore divers have placed it among the unitages, and or leftely as a smalleable as the former Maidenhaire for all the uses there experied, and besides helpaths buttlings in children, for Martholius saith that he hath knownedivers holpen by taking the powder of the herbe in drinke for forty dayes together.

Trichomanes. English Maidenhaire.

Vr common Maidenthaire doth from a number of hard blacke fibres fend forth a great many blackish thining brittle stalkes hardly a spanne long, in many not halfe so long, on each side set very thicke with imall round darke greene leaves Trichemanes. English Maidenhaire.

and spotted on the backe of them like Cete-

The Place and Time. Itgroweth much upon old stone walls in the well puts and males, in Kens and divers other places of this Land, it joyeth likewise to grow by Springs and Wells, and other Rocky moist and thatowy places, and is greene alwayes.

The Names. It is called in Greeke Texpuses Trichomanes quod rura cute fluentem capillumexplet, for wards israrum and gire capillum, Gaza translateth it Pilicula, Fideclars some have it a the Apothecaries beyond the Seadiduse to call it Polytricum and Capillarie, wee usually call it in Latine Trichomanes, and

in English common Maidenhaire. The Vertues.

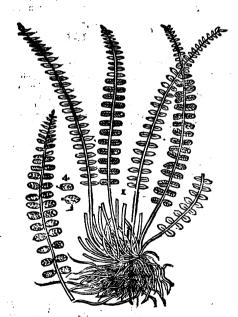

This Maidenhaire in our Land being more plentibil then the reft, is of more use and of as good that many of the former, and ferverh well for all the faid purposes, but especially against the stop-ping and dropping of Vrine and those that have the stone in the Kidneyes, and both stayeth the helding of the haire and causeth it to grow

CHAP, XIIL.

Pohtrichum aureum. Golden Maidenhaire.

Lthough there be divers authors that reckon these herbes amongst the Mosses, and so call them, yet there bee againe others as authorsticall that put them acong the Capillarie berbos, and so doe I at this time also.

1. Polytrichum aurenm majus. The grenter Golden Maidenhaire, This small berbe bath a company of small brownish red haires to make up the forme of leaves, growing about be ground from the roote, and in the middle of them in Sommer rise fmall stalkes of the same colour, set with

very fine yellowish greene haires on them, and bearing a small go d ye'low head lesser then a Wheate Corne, standing in a great huske, the roote is very small and threaddy. 2. Polyerichum minus & minimum.

CHAPAIA.

1052

The two leffer forts of Golden-Maidehriaire. Thefe two other forts are very like the former, but that the stalkes grow not to much more then halfe the height. the one of them being leffer then the other.

The Place and Time:

The first groweth usually on bogges and moorish places, and also on dry places that are shadowy, where the second growet. likewife on Hampftead Heath, The Names.

The two first are called by many Polytrichum astreum, of fome Adiantum aureum, of Thalim Adiantum apunto, of others Museus capillaris, and Baubinus Polytrichum auren making three forts majus medium & minus as Thalise doth. but I thinke that divertitie rather rifeth from the place then nature of the plant, Fuchfin taketh it to bee Polytrichum Apulei.

The Vertues

The Golden Maidenhaire is of a temperature betweene heate and cold yet it dryeth rarifieth and digesteth : it helpeth to expectorate tough flegme from the Cheft and Lung s no lesse then the other Maidenhaires being boyled and drunke : it also provoketh urine, and helpeth to expell the stone, is profitable for Spleneticke persons and those that have the Falling sicknesse, the herbe boyled in water or Lye and the head washed therewith strengthnesh the rootes of the haire, frayeth it from shedding, and caufeth them to grow thicke where they are thin:briefely it is held to be as effectual as any of the maidenhaires, many other incredible things are reported hereof which are rather superstitious and therefore I forbeare to relate them.

Palytrichum aurenn mejus & minn. Golden Maidenhaire the greater and the left-

Ros folis filveffris longifolius. Long leafed Rofa folis.

CHAP. XIIII.

1. Ros folis five Revalla vel Rofa folis. Sundew or Rola folis.

Et mee place this plant with the rest being usually reckoned among the number of the Capillarie esteeme formerly, and tell you that it hath divers small round hollow leaves, somewhat greenish, but full of certaine red haires that make them seeme red, every one standing upon its owne footstake reddish hairy likewise, the leaves have this wonderfull propertie that they are continually moist in the hottest

118610. whe hotter the Sunne shineth on them the moister they are, with a certaine shiminesse that will rise

ware, hew the difference.

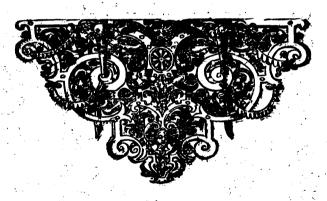

The Place and Time.

The pow usually on bogs and wet places, and sometimes in most woods, and flower in Inne, the leaves beging then to be gathered,

The Name.

PVLSES.

CLASSIS VNDECIMA. THE ELEVENTH TRIBE.

CHAP. I.

Ntending to thew you a little world of Pulles, let me for your better apprhenion as my more methodicall declaration, divide them into two principall or primary back that is, first into such kindes, as either have claspers, whereby to clime upon what stake, tree, &c. standeth next it, or without claspers, twine or winde themselves bout stakes, &c. or any other standeth neare thereby. And secondly, into such kinds as have no claipers, doe either stand more upright of themselves, or bend downsmud or lie upon the ground, whereunto I will adjoyne the kindes of Tresoile, and rest in neighbour hood unto them, with some Medicas

and Scorpioides. 1. Faba minor (ylveftris. The common wilde Beane. This common wilde Beane groweth upright like the Garden Beane, and leaneth not downe, yet being thicke

1. Faba minor fy veftin. The common wilde Beane.

but the small tendrells at the ends of the stalkes and branches sustaine them the better : it hath leaves like unto thank garden annea, fome paler or blacker than o-2. Fabasylvestris Grecorum sive Faba veterum. The old Greekish Beanc.

The Theater of Plants.

this Greekish Beane shootest forth two or three long flat stalkes, with two edges, lying or running on The Greenin have nothing whereon it may rampe or rife, which branch our on every fide in to stalkes of he grame, in the feet thereon by two and two, with a diffance betweene them, like unto the Garden Beane, and the loan of the many sections of the Garden Beane, and the branches under the leaves, and the branches under the leaves, and stated or fullen purple colours, with fome paleneffeat the bottome of them: after which fucceede long and stated or fullen purple colours, and the stated of the branches under the bottome of them: after which fucceede long and stated or fullen the branches and described or fullen the branches and described or fullen the bottome of them. and the pods, with two that peedges and dented about, alittle hooked or bowing, greene at the first, but hat when they are ripe, wherein are contained foure or five or more round feede as bigge as Peafe. ad try blacks, fo that one may well say they are rather Pease than Beanes; the roote growth not deepe, nor salvery makes, to the control of the salvery makes, to the salvery makes, to the salvery makes the salvery makes, to the salvery makes the s

We have had another difference hereof fent us by this name, which onely fetteth forth the distinction berecordem little differing in any thing elfe. The Place.

The full (where foever it is wilde we know not) we fow it generally through the Land, to ferve horses for their hede the other groweth naturally in Spaine from whence Guilloum Boel fent me feedes. The Time.

Theleflower in Isly, and their fruit is ripe a moneth or more after. The Names.

The Beane is called Kiapos ayer in Greeke, and Faba fylvoffris in Latine, and sammes in Greeke is added motheother, and Faba Graca in Latine to diftinguish in from the Leypela, a feracitate ditta, say some. The hathbeene much disputation and alteration among our later Writers concerning the Faba veterum or esignamm Gracerum, fome referring the delineations thereof to our Garden Beane, but with more words ma serded, for the ancients comparison of the feede unto that of Lotie, Terebinthus, and the berries of Tow sort evince all their words and reasons, whereof I doe not intend to say any more here; for Lobel and Induction have hewed the errours and militakings: the first here set downe, is the Banasive Phaselum minor by Daum, Faba minor by Lobel, and Faba spressin by Matthiolus, Camerarius, Lugdunensis, and others: the other is the Bona five Faselus sylvestria by Dodoness, Faba Gratorum sylvestria by Lobel, Pila nigra h Comrains, and Vicia Romana by him alio: Our later Herbarists call it usually Faba veterum, or Gracorum; and Lucianentia Phasiosias fylvestria. Many worthy families among the ancient Romanes had their names from Russ and Peafe; and no doubt first rose from their predecessours, sowing and selling of them, as Fabius Porcius, Quian Fabius Maximus, or from other accidents, as Pife, Cicero, and divers others; and the use to number with Rues doth continue among the Venetians to this day : it was also an usualt custome in former times in Italy, and other places adjacent to charle their Governors by calling Beanes into a Bason, the affirming party calling in a white Beane, those denying a blacke one; and from hence came the manner of choise of officers in many places by the billeting boxe to put in certaine bullets, the greater number in a partition carrying the choice.

The Vertues. The Garden Beanes are with us more used for foode than for Physicke, yet the lesser also in many other counminufed with a little Wheate and Rie to make them bread, and being greene nourish more than when they while but are more windy, and eacen after they have beene dried or fried engender leffe winde, but are then diader digelion: the diftilled water of the flowers of garden Beares is used of many to clense the face and thing, and to take away both spots and wrinckles, the same doth the meale or flower of it, as well as of the full: the water diffilled from the greene huskes, is held to be very effectuall against the stone, and to provoke mint: Beane-flower is used in pulcifies that do asswage inflammations rising upon wounds, as also the swelling dibecods or of womens breaks caused by the curding of their milke, or by inflammations, and represent their mike, and kee peth backe children from growing too forward being laid to the share : if the flower of Beanes and femogreeke be mixed with hony, and applied to felons, biles, blew markes by blowes or bruiles, and the im-Polumer in the kernells of the eares, it helpeth them all, and with Role leaves, Frankinsense, and the white of antege laid to theeyes that swell or grow out helpeth them, as also the watering of them, or stripes upon them, if abrased with wine: if a Beane be parted into two, the skinne being taken away, and then laid on the place where Leech bath beene fer that bleedeth too much, it flaieth the bleeding a Beane-flower boiled to a pultiffe with wine and vineger, and some oyle put thereto, ceaseth both palme and swelling of the cods a if fried Beanes beboiled with Garlike, and daily taken as mease, it helpeth inveterate coughes almost past cure, the hoarsenesse of the royce, and the impostumes in the breast : the huskes of them boiled a good while in water, that is to the thirds high the laske: the after of the baskes made up with old hogges greafe, helpeth the old paines, contuitions and wands of the finewes, the Sciatica also and the Gout. What hath beene spoken of the greater, is also effectuall with lefter Beane without more repetition. The Eaba veterms is without doubt that true Beane which Dioffinder, Galen, and other Greeke authors intended when they fet downe all the remedies they fet downe of it; al hardore although we use our ordinary Beane-flower for all the purposes, and to good effect, yet theirs is the most proper, which vertues every one may trie as they fee cause.

CHAP. II.

Phofiolas. The French or Kedney-Beane.

Have in my former Booke giving you the knowledge of the ordinary Phasislus, or Garden Frank.

Beanes of divers colours, but there are fundrie other fores, some mentioned by Clusius, and some by others; whereof with those wee have seene our selves; wee entend to give you in this Chapter shifts.

1. Phasislus flore coccines. The Scarlet flowred French-Reame.

The Scarlet Beane rifeth up with fundry branches twining about flakes that are fet for it to runse thirto, has turning contrary to the Sunne, having three leaves on a footestalke, as in other of the fame kinde; the flowers for fashion like unto the rest, but are many more set together, and of a most orient scarlet colour; the Benerate rish the ordinary kinde, and of a deepe purple turning to be blacke when it is ripe and drie; the root point of the flower with us.

2. Phasolus siliqua hir sura. The hairy Kidney-Beane called in Zuirate where it groweth Content.

We have had an other of this kinde brought as out of the East Indies, which being planted, was in few like the former, but came not to perfection, the unkindly season not suffering it to show the slower, but the colouble were brought, some were smaller, shorter, and rounder than our garden kinde, others much longer, and many growing together as it were in clusters, and covered all over with abrowne short hairinesse, so fine, that it say of the rubbed or fall on the backe of ones hand, or other tender parts of the skin, it will cause a kind of ithing, but not strong nor long enduring, but passing quickly away without either danger or harme, the Beans were smaller then the ordinary, and of a shining blacke colour. There are sundry other strange form of kidey-Beanes, whereof Clussus maketh mentions the first, (as most of the rest) groweth up with winding salks and branches, and with three leaves set together on long foote stalkes, and many white slowers in cluster, and branches, and with three leaves set together on long foote stalkes, and many white showers in cluster, and lines. His second fort is not much differing in sorme or colour of slower from the former, but that it somewhat paler, and the Beanes are very white, smaller, and more full or swelling than the ordinary white kinde. A third fort is somewhat reddish at the end of the foote stalkes, the slowers stand by couple being larger, pale on the outside, and of a blewsh purple within, succeeded by reddish Beanes, thicke and short, and somewhat sull and round. A sist fort hath reddish greene stalkes, and smaller darke greene leaves; the sower were great and many, of a yellowish colour, the Beanes were smaller, contained in shorter and narrower ods,

The Scarlet flowerd French Beane.

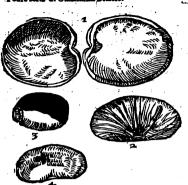

1. Phofesti americani Purgantti. 2. Lati magni albi, 3. Æguprij. 4. Brafiliani. Foure forts of Outlandilli Beanes.

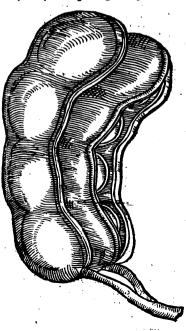

Photeoli parvi en America, Small Kidney Beanes of America.

Plafedes Braflianus magem. A great Brafill Beanc.

and short, and somewhat full and round. A fift fort hath reddish greene stalkes, and smaller darke greene leaves, the flowers were great, and many of a yellowish colour, the Beanes were smaller, contained in shorter and narrower cods, and of a darker colour. A fixt had narrower leaves, with smaller reddish Beanes, & flatter than the other. A feventh grew not so high as the ordinary, or his first, the leaves were as narrow as the last, and the flowers white, the cods short and yellowish being ripe, with white Beanes in them spotted or striped, to the length or athwart, more great or lesse in some than in others, and in some all blacke, u ith a few white lines in them, or else parted halfe white and halfe blacke. An eight in leaves and white flowers was like his first, and the Beanes not to white as the ordinary, and fometimes spotted, either directly or confusedly, or becomming blacke wholly. A ninth had great white Beanes sported with reddish veines. A renth had purplish flowers, whose hoods were darker, and various coloured Beanes turning blacke in broad flat and brownish cods. An eleventh had blacke lines or veines running in the reddiff Beanes diverily marked. The Beanes of the twelfth were of a paler red, with blacke stripes on them. The thirteenth wee have had from Brafill the least fort that ever was feene; for although it hath the fame forme of three leaves, & twining it felfe, yet are the Beanes blacke shining, and leffer than Tares by the halfe. Another had large white flowers, sender cods, and white Beanes with blacke spots. Another, the least of many whose Beanes were smaller than Pease and round. Divers others might be fet forth, but that divers of them came not to maturitie, most of them that sprang had twining branches : yet fome grew upright, whereof the fourth fort had short and firme stalkes, not needing any. Xxxx 3

Ta.13 B.11.

a bigge at ones finger and hieronamich many locall fibres thereat.

The other wilde Peafe.

The branches of this other are fearce halfe a foote long, with broader and shorter leaves on them, but like the decrease rate. Betrancine or pale, the Peafe and cods, likewife not differing in forme but much lefle, the roote abiding many firms, which is kinde there is another found to grow fome what larger.

ort. Of this knille there is should require to grow notice what target.

3. Refem followers may non maculatum Baticum. Spanis blacks spotted wilde Peafe.

This spans Peafer illument change like the first, but that it is lesser, and the slowers are of a pale yellowish.

The Spans Peafer illument dealers close formed with rearrible for the start of the sta The peaks being of a darker clour, fpotted with very blacke fpots like velvess the roote perifheth

4. Pifum fontamenm maritimum Anglicum. Wilde English fea Peafe. This Se Peale differeth not much from the second fort of wilde Peale, but is somewhat greater, and bearing mossons together in a ruit, mist of purple and ash colour: the succeeding huskes are small and long, the mes living. 4. Pifum alindmaritimum Britanicum. Suffolke Sca Peale.

This back of Sea Peak hath a stalke of a trianguler forme full of joynes, bending to the ground, with two historicity joyne, branched forth indivers places with winged leaves at them, confifting of tenne or twelve his gene leaves, fee by couples on a middle ribbe, with a small classer at the end, each leafe being not much shippend in the flowers grow towards the toppes of the branches, eight or tenne fet together militant the Sex Purifine: athe flowers grow towards the toppes of the branches, eight or tenne fet together militant to a final tenne fet together toget remine cight or tenne Peale in a cod, each whereof hath the whitenesse called the eye, compassing balfe the command right of the content of the ording deepe interest and baich of the Sea (yes about a yard or more deepe, there is found fome fand wherein it forea-th) and in not great bits flender pliant and flexible, not fweete, but bitter as the whole plant is, and the Peafe alam punit no great energy years, and from the old head will shoote many long white tendrells like the roote nine mail Bindeweede whereby it encreaseth wonderfully, and not by the feede, as I am perswaded, for that of the man blance we have growth falling thereon, in not having any nouriflament or moifture of fand, before or discetwo or three foote deepe, and the birds for the most part devoure them up. I have also put some of the Rucisto the ground of my Garden, but none would fpring.

1. Pifun filvefire primum. The fuft wilde Peafe.

3. Pifem sylvestre nigrum Betteum macelerum. The Spanish blacke spotted wilde Pease.

thing touphold'it, while nor above a foote high, whole trefoile leaves had thereer foote that the love thing touphoid it. The northouse a roose ingress whose treatment and pale, or else of a shining swatch color, which, and the fruit either with a place of post, or reddin or pale, or else of a shining swatch color, which kind, as it is most likely is the Phospolar, or Phospolar Cords, which he does not have a likely in the 43, file of his he which kind, as it is molt likely is the reasion, or conjusting over the state of th notations upon Discorder, and in the 127-1919 OF HIS TAMORY OF TAMORY OF THE PROPERTY OF THE P felfe in one of their two places. I now math come likewise unions and were endlesse two places and west Indies, Virginia, &c. Sundry other forts and varieties which were endlesse to resize, or a helps. not knowne that ever any impo was wratered, but as a restrict gether new forts, fome floring on the want coults of America; for the inhabitants thereabouts doe yearely gether new forts, fome floring on the want. others raked from under the fandes of the shoare, The Place and Time

The first here described grew in the West Indies, and first grew with Mr. Tradescane, yearly flowing inte ufuall Season, and giving ripe fruit: the second here described came from the Magols countrie in the Ed line. and onely fprang up with us, but continued not.

The Names. Dioscorides callettethis quina suilax hortenfis quod Smilacia mode confeendis ; Theophratia middin Discordes catterstates σμέλας κατατικό σμέλας Authors follows, or Dolliens, which many Latine Authors follow: fortestloods, and λόξειν propter fliquarum longitudinem. Some also take it to be Dissordes his panels, or as Galistinians. and 266111 propter juignarum tongun mounts. Controversie among former Writers, as Matthielus agains stands where of there hath beene much controversie among former Writers, as Matthielus agains stands that thought the 7 hasis of Dioscorides to be Ervilia, and the Smiles breaks to be the ordinary Politicalis. now adayes so called, which opinion, how sever Matthielm congradicteth, and would force his own, which now adayes to catted, which opinion, now adays to catter the profiner white Kidney Beanes were the Physical of Disfordar, which can no wayes stand with resson, seeing Disforder setteth his Physical among those Pulses that grow wide, and besides saith, that they are hard of direction, and move vomiting, which is not proper to these kinds, but of the standard of the many wilde forts of Pulses, and in the Chapter of Spartium fruten, compareth the seedes thereof to those of Plan fiole, and that his Smilax hortenfis was the other discolored forts of Kidney Beanes, but they are as well for forme as in effect in my judgement the same. Another doubt there is with some, whether Theophrafin his Detichus and Dioscorides hie Smilax horsenses be but one or divers; but Galen in primo aliemeteram hath decided that long agoe, where he saith, that because Theophrassus saith his Dolichus needeth long poles or sakes to uphold it tong agoe, where he taith, that because I veoporagine saith his Doiscom needeth long poles or takes to uphold it that it may profiper, he furely delineated hele Phasioli, or Dioscorides his Smilax borrensis: 6 that posses it without doubt that Smilax borrensis; Polichus, and our ordinary Phaseolus to be all one: Stim also in his first Booke faith the fame, for any phaseolus his Phasiolus is the same with Galen his Phasiolus is the same with the same w is colled by Lugdunensis Phasiolus Sylvarum, and by Clusius Orobus Pannonicus : Cordus in the places before mentioned maketh Phaselus and I hassolus to be but one kinde of plant, and differing from Phaselus, which mounteth upon poles, the Phaselus not rifing: Virgil and Columella doe both make mention of Phaselus at el simil and vile Pulle : Virgil in Georg. fecundo, in these words, Seu pinguem Viciam feres, vilemue Phaselum. Dolnem maketh our ordinary garden Beane to be Phafelus major, and the wilde kinde to be Phafelus miner, and faith without d .ubt they are the right: but by his leave they are not right, where in I referre me to other judgment, confidering what I have here before written, and especially in that the Lentill-like seedes of Spartium fruits, are by Dioscorides compared to those of Phasiolus, when as the lesser Llacke Beanes are sarre bigger than any Spanish broome feede, or the pods comparable.

The Vertues. The Kidney Beanes that are nursed up with us of all forts, and come to maturity, being of casie digellion, and hot and moilt in the first degree, doe move the belly, provoke uring, enlarge the break that is streightened with shortnesse of breath, engender sperme, incite venery, especially it Sugar, Pepper, George and Galanga beaded thereto: for they are well knowne to most to be a familiar dish of meate taken while they are young, boyled, and flewed, or fried, & some Verjuice put to them, and spice firewed thereons Mathielas faith, that if the grone pods be chewed in ones mouth, and applied to any place that is bitten by an horfe it will helpe: healfolloweth that the Italian dames made a water or justs for their faces of the pods and feedes of these Beanes, with a fresh gourd, crummes of bread, and Goates milke, &c. distilled. The fish called Scarpe (which is somewhat like a Barbell) as Bellonius doth fet it downe in the eight Chapter of his first Booke of Observations is much delighted to feede upon the leaves of this Phaseolus or French-Beanes, and that therefore the Greekes of Candy that dwell neare Milopotamo and Cigalinas, where this fish doth abundantly bredde betweene the rocker, doeuken put the leaves of this Beane into their Weeles, or Bow-nets, as a baite for this fifth, knowing that they can hardly betaken by line or hooke but onely with this herbe, and therefore in their Language they call it Scarovatan.

CHAP. III.

Pifum. Peafc.

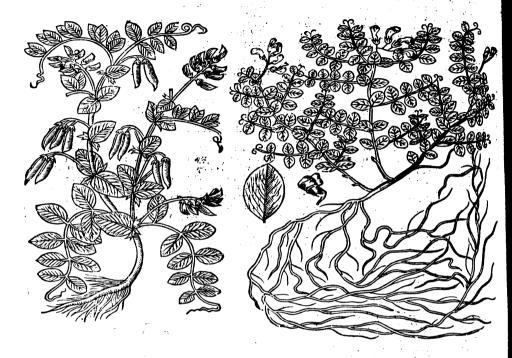

all the forts of Garden Peafe, I have spoken sufficiently in my former Booke, there remained now that I should show you here the wilde kindes which are these.

1. Pifum fylvefire primane. The first wilde Peale.

This wilde Pease doth little differ from the manured, either in ramping formered statkes, which wanted the pranches, which broad thiffe greene leaves, two alwayes being fet at a joynt, and fixe or more lefter ones on the branches, which end in a classer, the flowers are white, many standing on a foote stalke together, which turne into so many code, each much smaller than the manured, and the seede Within, fatte lesse also, and of no pleasant talle; the south TRABLIE

4. Pifum (pontantum maitimum Anglicum
Wilde English Sea peale.

5. Pifum alind marithum Britanieum. Another-Fugiifh Sea Peafe.

The Place.

The first is often found in fundry places of this Land : the second on the chalkie hills at Kings Hog in Kon, no farre from the Thames, and the larger fort hereof in some barren fields in Effenthe third in Spaine; the fourthin Kent also neere Rumney : the last was first made knowne in the yeare 1555 being the third yeare of Queene May to the Country dwelling thereabouts, that is betweene Orford & Alborough, where it grew upon the batch of the fea, where nothing, no not graffe was ever feene to grow, and by the dearth of that yeare the people in peoffice of foode, fearching every where to take what came next to hand (for as it is faid many were forced at that time to make their bread of Acornes) gathered many quarters full of thefe Poafe to ferve their ufe; yet did the neighbouring people acknowledge that they had observed and knowne them to grow there of long time before that deare yeare. Mr. Stow in his Cronicle, and Mr. Camden in his Britanica, pag. 354. make mention of the Pele, but both flumble at one stone, that these might come this therby some ship wracke, which cannot be so: and Mr. Stow more especially in saying the rootes are great and sweete, for that it is swigeners, a special kinde differing from all other of that kinde; and as it is probable naturall only to those places about the Sea shourt, for it is found allowed. alfo at Rie, at Pempe in Suffex, at Gilford in Kent, over against the Comber, and at Ingolne Milles in Linchine faire Mr. Iohn Argent Dr. of Phylicke, of the Colledge in London, brought from thence also the whole plant, such a year see is here figured, which he gave to Dr. Lobel in his life time, to be inserted in his Workes, but he prevented by death failing to performe it, I have by purchasing his Workes with my money here supplied.

The Time. These flower and beare their fruit with the later kinde of Field Pease; but the last flowereth in the end of last, and hath both blowne flowers, and ripe cods in the end of August, and blossomes also not halfe forward to The Names.

Peafe are called in Greeke alber, in Latine Pifum; the names in their titles are sufficient to diftinguish them. for except the first, none of these have beene mentioned by any former Author; the Italians call them Pick; the French De pois, the Germanes Erbfz.

The Vertues. Peace are less windy than Beapes, but passe not forth of the body so soone as they sift be wildekindebe boyled in Lye, and the head washed there with, it clenseth it from scurffe and scabbes: the same also denseth be boiled. of spots; the meale of them, and Barley mixed with honey and used, healeth foule ulcers; and the meale boiled in water with Vetches, breaketh tumours, and easeth their paines being applied. Comerarise faith, that in Francisco character and the contraction of the contraction conia, they call it Daringicht krant, and use to take some of the Pease against the collicke: and apply the helbe outwardly and give it their cattle also for the same purpose, that is, if they vent much,

CHAP. IIII.

Lathyrm. The great wilde Cicheling or Peafe everlasting.

F this kind of Pulse called Cashyrus there are two specificall differences, the one that continue in their roote, and perifheth not, the other annuall perifhing continually after feede time: many of the living forts I will intreat in this Chapter, and of the annualls in the next.

This kind of Peafe fendeth forth many long flat trayling flatkes, winged on both fides which must be shaded, divided into fundry branches with two leaves at the joynta which are formewhat long and not befined, with force claspers at the ends of the branches, at the joynts likewise come forth pretty long stalkes with control of the branches, at the joynts likewise come forth pretty long stalkes with control of or more Pease-like blossomes, of a sine pale purplish red colour, and of a sine smell, after which sends small long and hard whitish cods, with small round blackish seeds in them, the roots groweth section to the control of the contro

a. Lastyrm angulifqlim. Narrow leafed wild Cicheling.

The different not in durability forme of growing, or colour of flowers from the former, but in having some whater flowers and in the greene leaves which are narrower then they.

3. Latbyrus Sylveffris Dodonei. The wilde Cicheling of Dodoness.

This hath longer winged stalkes and somewhat larger leaves, but shorter claspers then the last, the flowers mota deepe purple, and the cods are long and flender, with small hard round seeds within them the roote

4. Lathyrus arvenfis five Terre glandes. Peafe Earth-nuts.

The Earth-nuts have divers weake and finall fquare stalkes running upon the ground source or five foote. he the leaves are small usually two set together upon a branch with a clasper at the end of each, taking hold dwarfandeth next to it : the flowers come forth from the joynts towards the toppes of the flakes upon has footbalkes, many growing together being narrow, and of a deepe reddiff, purple, fomewhat bright, the cost that incceede them are finall and long with small round seedes in them, the rootes are tuberous, backed small fastned to long strings, which spread much under ground, in taste somewhat like to a dry Chefnr. Inhim maketh it and the next to be both one plant.

5., Lathyrus sylvestrie lignosior. Our Wood Earth-nuts. This creeping wilde Peafe-nut hath not onely greater, longer and harder rootes almost wooddy then the

T. Lathyrusmajor perennis.
The greater Peale everlasting.

4. Laibyrus arvenfis five Terre glandes.

former

5. Lathyrus (ylveftris lignofiore
Our Wood Earth-nut.

6. Terra glandes Americans fre Pirtmine. Virginia Earth-mur

former, but the crefted stalkes also are harder and lye on the ground with foure smooth long and narrow leaves ufually, and fometimes five on a branch, smallest at both ends, and one clasper at the end: the flower are purple or cimfon, and the cods are narrow long and fomewhat browne in the beginning, and paler as they grow older, within which are small round seede no bigger then a Vetch or rather lesse, and of a wan colour, this is the Astragalus Silvatum Thaly.

6. Terra glandes Americana sive Virginiane. Virginia Earth-nuts. Let me adjoine this plant to these two later forts for the rootes sake, whereunto in formethey are most like, although differing in the greene long leaves which are many fet on both fides of a middle stalke the mainestalke it felfe winding it felfe upon any thing standeth next unto it, and rifing from a tuberous browne roote, which multiplyeth it selfe into fundry others : at the joynts of the stalkes with the leaves and in other places of the stalkes likewise come forth the flowers many standing together spike-fashion, of a sullen blush colour made almost hke hoods, which fall away with us not bearing any fruit, and the leaves and stalkes perishing before Winter, new railing themselves in the Spring.

7. Lathyrus filvestris store luteo. Tare everlasting.

This 1 amping wilde Vetch or Tare as the country people call it, because it is the most permission herbethat can grow on the earth, for come or any other good herbe that it shall grow by, killing and strangling them : it groweth somewhat like unto the first but the leaves are smaller, the flowers are yellow many upon a stalke and after finall round cods with blackish small seede in them : the roote is small and rough running infinitely under ground not to be destroyed.

The Place and Time. The first and second are usually cherished in Gardens for the beauty of the flowers as I said in my former books, and like wife hath beene found wilde with us as is before faid, if it be not the third which is entituled of Dalacem, she fourth is faid by Gerard to grow in many places with us as Hamfred, Coume Parke, &c. but we rather thinke it was the next. for the rootes of those wee have hitherto found in our woods and hedges sides have been more wooddy then the other forts, which growing in our Gardens wee have seene to be more tender, and came tous from beyond Searthe last is found oftener then men would have it, being a plague to Field or Orchard whereinto it once getreth: they all flower from the end of Inly to the end of Anguist.

The Names. This Pulse the Greekes call And Sup @ Lathyru, but is diversly called by divers moderne writers in Latine, for fome call it Lathyrus five Cucircula and by Banhims Cicercula, by others Lathyris as Lobel, etc. but unfilly for Lathyru is generally taken for Spurge, againe Aracus or Cierra as Dodoneus, yet Tabermonianu to put a difference here of the Spurge, againe Aracus or Cierra as Dodoneus, yet Tabermonianus to put a difference here of the spurge rence betweene chem calleth them Lathyris leguminofa : Matthiolus calleth the first Chymenum, Cefalpium Ervi lium, Tragus Pisam Grecorum, Fuchium Ervum filvefire: The fourth is called Apies by Fuchium and Tragus, but Plendoapies by Matthielus, Chame balanus by Dedonaus and Tabermontanus, Terre glaudes by Label and Peul,

TRIBE II. Gudnurrefires by Cluffus, and Arachidna Theophrafti by Columna, who faith hee can finde none come fo Communities by company, and experience I responsive by Columns, who faith hee can finde none come to partial of Theophrafter as this; the last is called by Dedonans in the Chapter of Terre glandes Legumenterra best faile, by Thelius Lathyrus sylvestris floribus luceus, and Baubinus addeth thereunto foliss Vicia, the reft se specified with their descriptions.

The Vertues. Color fifth that Lathyrus is in substance much like to Ervilia and Phaselus, and that the countrey people in his country of Afia did use them not onely as they of Alexandria and other Cities did their Phases and Ervilia, be made them into a pultage as they did Lentills, but faith hee it is of a thicker confiftence then they and therefre nouritheth more.

CHAP. V.

Lathyrus amount. Yearely or Annual Cichelings.

He other fores of Lathyrus which are annuall as I faid before in the devision of Lathyus in the former Chapter. I referved to be here fet together distinct from the former.

1. Labyrus annuns major Betiens. The great Spanish annuall Cicheling. This hath two or three flat stalkes a yard long or more welted as it were with skinnes or filmes on both edges, having two small leaves at each joynt where shoote forth the branches, bearing two resomble long and broad leaves about the middle thereof one against another, with a twining clasper running or betweene them, the flowers frand fingly upon long footfalkes, of a deeper purple colour but leffer them or Garden kinde first described in the last Chapter, after which succeede long pale coloured cods very like unwith sthe feede within them is likewife; the roote is small not running deepe nor growing great but peniheth every yeare.

2. Latherns Betiens elegans filiquis Orobi. Spanish partie coloured Cichelings. This fpringerth up into divers branches a fadom long, with fuch like welts or skinny membranes on both fide, acvery joynt whereof come forth long leaves divided at the toppe into two other smaller leaves, and higher upwards, set with six leaves on both sides, and on the middle betweene them commeth forth a small disping tendrell whereby it catcheth hold of every thing flandeth next unto it, at the joynts likewise come furnite flowers, either one or two at the most upon long footstalkes like unto the other of his kind, the upper laked fine Crimfon or Orenge colour, and the other in the middle of a perfect white: after the flower is past comment the fruit in long pods, every feede bunching out like the pods of Orobus and as bigge almost as the smal-

Latbyrus major filiqua brevi. The greater thort codded Cicheling. This is manner of growing differeth little from the former, onely the flower hath the inner leaves white

2. Lethrens Betieus elegum filiqui Orobi.
Spanilo partie coloured Cichelings.

2. Lathyrus major filiqua brevi. The greater thort codded Cicheling.

I atiturne

parvus

alier.

and the outer somewhat purplish: the cods that follow are thicke and short, with small round blackish Peafe within them.

4. Lathyrus minor filiqua brevi. The lesser short codded Cicheling.

The difference betweene this and the last confisherh more in the smallnesse then in any other thing saving that the cods hereof have a little roughnesse on them. Wee have another smaller then the last agreeing in most things else faving the cod which is longer and fmaller.

5. Lathyrus major angustissimo folio. Graffe leafed Cicheling.

The stalke hereof is slender and weake, the leaves long and narrower then graffe, fometimes two and fometimes three together: the flowers frand each upon a stalke of a blewish purple and sometimes reddish, the fruit is finall and blackish contained in small short coddes; crooked at the ends.

6. Lathyrus miner angustissima falia. Fennell-like leafed igheling,

This is smaller weaker and tenderer in all parts then the last, the leaves are as small thin and long as Fennell, the coddes and frede are like the last onely the flowers are of a pale reddish colour.

7. Lathyrus palustris Lusitanicus. Spanish Marsh Cichelines.

This in the beginning different listle from the first but that the flowers fland untilly two together, the outer leafe of a bright purple and the middlemost of a pale purpie : the cods are denderer and as long as the first, of a pale colour, with small spotted Peale within them ourning blacke when they are day.

8. Lathyrus Baticus flore lutes. Yellow Spanis Cicheling. This Spanish kind is in bignesse, forme of stalkes and leaves like the first of these here set downs, only the flowers are all yellow with purple veines in them, after which follow cods very like, and of the lane bignesse with the first, but the Pease are smaller and rongber, or as it were netted.

The Place and Time. All these forts except the fixt (which I found in clenting of Anne feede to use) grow in Spains, and from thence were brought with a number of other rare seedes besides by Guillaumo Boel and imparted to Mr. Coptof Stabbers in Essex in love, as a lover of rare plants, but to me of debt, for going into Spains almost wholly on my charge hee brought mee little else for my mony, but while I beate the buth another catcheth and eateth beind: fo while I with care and cost fowed them yearely hoping first to publish them, another that never saw them unlese in my Garden, nor knew of them but by a collaterall friend, prevents me whom they knew had their deferiptions ready for the Preffe.

The Names. Their severall names are expressed in their titles, none of them being/published before, except you may referre the fift unto Banbinus his Latbyrus major angustissimo folio, described in his Prodienus whereunto itis moft like.

The Vertues.

I have not understood that they ferve for meate or medicines to any of the people where they are naturall; but utterly neglected and should never have beene further knowen, as it in like manner falleth out in all countries unleffe a cunning curious fearcher, fuch as this Boel was, happen to pry carefully over the coalts of them.

CHAP. VI.

Cicercula. Winged or cornered Cichelings.

Have you fee divided this Chapter from the two former, (although they may be and ate called Labri by many good authors) upon good grounds as I take it: for although in growing they are like Lahyar, yet some of them have their cods winged, and others not winged, and all have figure or control.

Pease within them: I thinke therefore these formes doe argue a specificall diversitie fit to be dillinged. guished, being all annuali also.

1. Cicercula five Lathyrus (ativus flore albo. White flowted winged Cicheling. This Cicheling hath weake winged stalkes trayling on the ground if they be not belief like as all the for mer have, with two small leaves at the joynts and two other narrower leaves like milk on the branches which end in divided classers, the flowers are white that stand on long footstalkes, and after them fomewhat stat and thort code with two little narrow filmes all along the backe of them, the feede within them is fomewhat larger then the wild forts, flat white and cornered; the roote is small and fibrous perishing every yeare.

2. Cicercula flore purpureo. Blackish purple winged Cichelings. This other is in manner of growing like the former, the flowers onely and the fruit declare the difference, hot

TRIBEIL 8. Lathyrus Balkeus flore lates. Yellow Spanish Cicheline.

tenowers are of a darke dead purple, and the cods that Winged Cichelings with writtee of black in purple flowers, the thowers are small and with filmes at their backes like the hathe feede within them are cornered but of a darke coiour almost blacke.

1. Cicerenia Batica & Egyptiaca Clusi. Blew flowred Cichelings.

This also differeth in nothing from the former but in har it list larger leaves and the flowers pale, blew on the milde and the inner leaves more blew, the cods are falland almost round winged at the backe like the formr, wherein lye browne cornered feede.

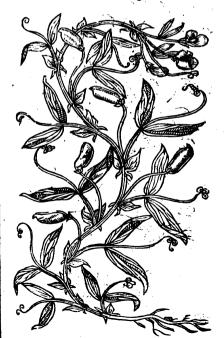

4. Cicercula flore rubente.
Red flowted Winged Chichelings.

The manner of the growing hereof is in all things like deformer, but that the greene leaves are narrower and longer then the last, and the flowers are of a kind of dead Omee colour after which follow fome what short round mkwith brown fh cornered feede.

5. Circercula five Lathyrus Béticus dumetorum. Spanist bash Cichelings.

Voto these kinds of Cichelings let me adde this as comming nearer unto them then unto Vetches, for this hath divers long weake stalkes with filmes on the edges, at the joynt are two small leaves, and from betweene them ome forth the branches, having divers fmall darke greene laves fet on them, fomewhat round at the ends, fomeimethree on a fide and fometimes but two, yet not alwave one against another, from the bosome of the stalke mittebranch commeth forth usually two flowers on a log footestalke the upper leafe being reddish and the ohe purplish, after which come long smooth cods withon my filme at the backe having within them round but described or formewhat flat feede of a brownish colour.

> 3. Cicercula B. tica five Egyptiaca Cluff. Blew flowred Cicheling.

Cicercula flore rubente. Red flowred Cit helings.

Yyyy

The Place and Time.

All these forts were brought us out of Spains although they grow in other countries also : they flower and beare ripe fruit when the former doe.

The Names.

The three first are remembred by our moderne writers, Dodoneus calling the former Aracm for Labour in nor and Cicercula, Lobel Lathyris angustiore gramineo folio, Camerarius Lathyrus flore allo, Lathyris angustiore gramineo folio, Camerarius Lathyrus flore allo, Lathur called it E. nor and Cicercusa, Lovet Lastyris angustore grammenojotto, Camerarius Landyris and Collect E. vum, Fachfius Ervum album fativum by Tragus Pifum Grecorum fativum, and by Cordus on Dioferides Philips minor, aliquibus Ervum angulofum: the second Dodonesse calleth a dracus five Cicer and Conserves Labyrus for purpureo: the third Clusius calleth Cicercula Agyptiaca, and Camerarius Aracus Hispanicus sive Lauprus for tiacus: the fourth was called by Boel Lauprus Baticus store miniate, and the last by him also Lauprus Baticus store miniate, and the last by him also Lauprus Baticus store. The Vertues.

All of them as Boel faith are eaten by the poore people in Spaine in the want of bread, for where there are food feldome doe they talte of any bread of Corne : they are all of a compact substance, and therefore nourifunore but are hardlyer concocted.

CHAP. VII.

Onchas five Ervilia. Winged wilde Peafe.

F this kinde of Pulle I have onely feene and nourfed up with me two forts much differing in the man-oner of growing and fruit from any of the other Pulles as shall be showed.

1. Froits fore of frake also. The white winged wild Pease.

This kind of Peafe hath two or three stalkes at the most which are broad and flat, welted or winged at the fides with somewhat long leaves shooting from them small at the setting to the stalke and broader to the

end, as it were growing from the middle ribbe of the otherat the toppe whereof standeth two or three twining class pers: this never shooteth forth any branches that ever I could fee, but the leaves from almost the bottomes of the stalkes upwards are parted as it were at the toppe of them into one or two fmaller leaves, or rather one or two fmaller leaves grow at the toppe of them, with the claspers between them, at the foote of these leaves come forth single flowers, like the former Cicheling, wholly white which turne into small round and long cods, with small crooked points at the ends, and filmes at the backes, wherein are conteined small round whitish pease, somewhat bitter, the roote is small and long, with fome fibres which wholly perish yearely.

2. Ervilia altera. The blackish winged wilde Pease. This other differeth in nothing from the former, but in the flowers which are tending to a reddish purple, and the Pease in the Cods, which are more duskie declining to a blacke.

The Place and Time. These we onely nurse up in our Gardens, having received them from friends, that are lovers of rarities, yet Lobel faith they grow naturally in Lombardie, they flower and give ripe fruite from the middle of July to the end of August.

The Names. That which Theophrastus in quarto de causis plant. 2. calleth a po Ochrus, Gaza translateth Cicera: but by Pliny lib. 18.c. 7. Ervilia, by which name it is utually called in these later times by most Herbarists, Label faith it seemeth to be so called quafe ernenda & egcienda; Matthiolm calleth it Aracus niger but erroniously; Dodonens calleth it Ervilia Sylvestrie, Lobel Ochrus fylvestris five Ervilia, and Lugdaniensis faith the Herbarists in his time called it Greer ervinum, the other hath not beene mentioned by any before.

The Vertues. We finde that Galen writeth in lib alimentarum that Ochrus hath a meane or middle property, betweene those that be of good & bad nourifhment, and between those that are of easie and hard digestion, breeding and not breeding wind, and nourishing much or little, and not of any speciall quality: in these later times, it is held to have a drawing, digesting,

cutting and clenting faculty for it is moderately hot and mostly and a little bitter withall, whereby it is available to purge the Liver Spicene and Reines, and to clenfe the skinne from morphew, fourfe, lepry and running tourn, it dissolveth hard tumors in the cods, and health Impostumes and foule fores being used with hony.

1. Och m live Ervilia flere & fruftu the

The white wilde winged Peale,

CHAP. VIII.

Aphaca. The vellow wilde Vetch.

of, not finding any other of the former or following Pulies, to be answerable thereunto, and there-fore take the description thereof here in this Have thought it fittest to place this Pulfe alone by it felre, and before the Lentills, as partakin there-

manner. It rifeth up higher than Lentille, with many weake flender and cornered interful of joynts, with finall leaves at them fet by completofe together until they be well growne, which the fand more feparate in funder, each whereof is had at the bottome, as it were clofing the stalke, and full at the end, formewhat like unto the fmall Bindewedeleaves branching upwards, and every one ending in forall clasper, the flowers come forth at the joynts of heleaves, and claspers with them, from the middle upwards, of a pale yellowish colour, and afterwards small adionewhat flat cods, longer than those of Lentills, wherein lie foure or five hard blacke round flattish shimig feele, the roote is small and long, with many fibres

The Place and Time It groweth in divers corne fields in Kent, and else where, flowreth in Inly, and the feede is ripe in An-

and endereth not, perifhing every yeare.

The Names. Itis generally held to be the A'oan Aphaca of Diofcoo des, Galen, and Pliny, the name being derived from the Pedeand the Lentill, both which it doth in fome parts memble, but not that of Theophrastus, which is accounted inter intubaces, but that in 8. Hift. Plant. c. 5. among Lentills, Peafe, and other Pulse, it is taken also by Lugdanenfis to be his Oce Bay Xn Orobanche lib. s.canfarange, 12, that groweth among Orobus and firangleth it. Ayulars and Camerarius take it to be his minen pitine, Dodoneus and Lobel call it Aphaca Dioscoridis. Laydannfu Orobanche legumen, because he acknowledgth mother Orobanche Tabermontanus Elatina tertia, and Budinus Vicia Insea folisis convolvuli minoris. The Vertues.

Disserides saith that it bath an astringent propertie, and that therefore being parched, broken and boiled, af-tirthe manner of Lentills, they stay the fluxes, both of

the thoracke and belly. Galen faith it is binding as the Lentill, & is used to be eaten as the Lentill; but it is hardlier digefied, yet it drieth more powerfully, and healeth moderately, which aftringent qualitie, faith Dodoness, wee have found true by our owne experience in this Aphaca.

Aphaea. The yellow wilde Verch.

CHAP. IX.

Lens Lentills.

Herë are three forts hereof, a greater, a leffer, and a spotted one, as shall be declared. 1. Lens major. The greater Lentill.

The greater Lentill hath fundry slender weake branches somewhat hard, two soote long, from whence shoote forth at severall palces long stalkes, of small winged leaves, that is, many on each side of a middle rib, without any odde one at the end for the middle ribbe of each stalk endeth in a small daspers the flowers are small, and rife from betweene the leaves and the stalkes, two for the most part at the end of along foote stalke, of a sad reddish purple colour, somewhat like to those of Vetches, after which emoe faul thore, and fomewhat flat cods, within which are contained two or three flat round smooth seede, of a ple yellowish ashcolour: the roote is fibrous, and perisheth yearely.

2. Lens minor. The leffer Lentill: This other is leffer both in stalke, leaves, and seede, the flowers are more pale, and the seede in the cods is white, wherein confident the whole difference.

This likewife the weth little difference from the last in any thing, but the seede which is blackish, spotted with blacker ipots.

The r. former even beyond the feaes, are onely fowne in the fields as other manured Pulies are, and so are they in The Place and Time

TRIBE II.

fome countries in our land, especially the smaller fort, which is every where, the more pleasant and acceptable, but the greater doth very hardly come to maturitie with us, if the season benot kindly and drie: the last is wilde in Portugall,

The Names.

It is called in Greeke pands and panh, Phacos, and in Latine Lens and Lenticula, Pliny faith, lib. 18.cap. 12. that the Exymon thereof feemeth to be taken, quafi lenis diffa fit, lenistiffy, fignificationem babeat, & equanimistatem fiers vefcantibus ca. The Arabians call it Hades; the Italians Lenticebia, the Spaniards Lenteias, the French Lentille, the Germanes Linfen, and so doe the Dutch also, and wee in English Lentills, but the country people in Hampshire, and other countries, where they sow it in their fields for their cattles foode; call it Tills, leaving out the Lent, as thinking that word agreeth not with the matter, Itasu Minervam.

The Vertues. Galen faith, that Lentills hold a meane betweene heate and cold, yet doe they drie in the second degree, the outer skinne being binding, and the inner meate also, yet a little harsh and bindeth the body, but the outer skinne much more: it is, faith he, of contrary qualities, for the decoction thereof doth not binde, but loofen the body, and therefore they that would have it to binde, cast away the first water, and use the second, which staieth laskes, and ftrengtheneth the stomacke and all the inward parts, Lentills husked, faith hee, lose with their shells, the firength of binding, and the other qualities that follow it, and then nourish more than those that are not husked. yet fo gvie they a thicke and evill nourishment, and slowly passe away, neither doe they stay fluxes and disenteries as those that are not husked. Galen further setteth forth the qualities hereof: largely to eate the broth of Lentills, faith he, breedeth the Leprosie and cankers, for grosse thicke meate, is fit to breede the melancholike humour, and therefore it is profitably given to those that are of a waterie disposition, and evill affected thereby: but is utterly forbidden to those that have dry constitutions: it is

Lens major vel minor. The greater or leffer Lenil

also hurtfull to the sight dulling it by drying up the mossibure, and is not convenient for women that want their confess, but rather for them that have them in too much abundance. Dioscorides surther addeth, it breeden troublesome dreames, and is hurtfull to the head, the lungs, and the sinewes: with other binding herbes, a Purslaine, red Beetes, Mittles, dried Roses, Pomegranat rindes, Medlers, Services, &c. taken with vinegar, it is the more powerfull to binde and stay laskes and fluxes: the decoction thereof with wheate flower applied askable gout, used with hony it closeth up the lippes of woundes, and cleanfest foule fores: being boyled in vinegar it dissolves the knots and kernells; and being boiled with Quintes, Mellilot, and a little Rosewater put thereo, it helpeth the inflammations of the eyes and sundament, but for the chappes thereof which neede a stronger medicine, it is boiled with dried Roses and Pomegranate rindes, adding a little hony to it: it likewise statements it is good for creeping cankers that are ready to turne to a gangreene, putting thereof some sea-water, and foit is good for womens breafts, that by abundance of milke have it crudled within them, if it be boyled in sea-water and spoked to them: the decoction thereof is a good lotion for ulcers, either in the mouth, privie parts, or fundament, adding a few Rose-leaves and Quinses.

CHAP. X.

Aracus five Cicera. Wilde Cichling Peafe.

Have two forts of Pulses to bring to your confideration, better agreeing with this tide, in my judgement than any other, let them of better learning and knowledge judge of them.

1. Aracus major Baticus. The greater Spanish wilde Cicheling Peale.

This greater Peale spreadeth on the ground, with divers square hairy, and crested stakes, sometimes a yard long or more, at the severall joynts whereof, grow many darke greene hairy pointed seaves, on each side of a middle ribbe, which endeth in a classer like the former Lentills or Vetches, at the foor of the leaves come forth single showers on very short some stakes, of a duskie whirsh purple colour, with deeper purple veines therein, and of a deeper purple at the bottome of the upperleaves next to the stakes, which when they are past, there come in their places short, thicke, and almost round blackish cods, covered with a short hairinesse thereon, within which lie three or source round blackish seede or Pease, almost like untoblackish velvet as bigge as the cicercula, but not cornered the roote is small and sibrous, and perisheth yearely.

2. Aracus minor Lustanicus. The lesser wilde Cicheling Pease.

This other agreeth much with the former, but lesser in all parts, and nothing hairy; the flowers are of a pale white

white in my Garden, or whitish yellow colour in other, and the cods, smooth; smaller, not hairy, with smaller and blackish coloured Pease within them: the montereof perisheth likewise. The Place and Time.

Both the Pulles were brought and fent one among ober feedes by Boel, before mentioned: the first out of Spine, and the other out of Portugall, and flowred in the end of Isly, giving their feede in Angust and September: in as be faid, he gathered the ripe feede in Aprill and Mg, in the natural places.

The Names.

Gales in putting a difference betweene deaxos willyn, Aracu, and Arachus, the one with x, the obu with 2, (and faith that Arachu is a wild weede or page in come, and that they picke it out of the corne, and that they picke it out of the corne, and that they doe Securedica, the hatcher Ferch. ad Thorse 8, Hiff ,c. 10, faith alfo that it is a hard and men hing growing mong Lentills; but of Araem hee fruith light of aimenorum facultate, in an other place) grahme occasion to referre these Pules thereunto efprilly, because judicious Anthors have rendered it Gunin Latine; and Columnila faith that Cleims differeth set from Ciercula in take, but in colour, because Cicera nerker or blacker than Cinercula and Palledres also in Marie hith the fame thing : but Arachus which is renand Craces in Latine, is more like a Vetch, both in growing and in bearing many flowers inch fpike as the toppe, which this doth not : thus have I endeayoured to diffinwith these plants, which I finde so many learned Writers below me have confounded, but Podonew his Aracus offices, as I have thewed you before, pertuineth to an ohr kinde: the first of these came to see from Boel, by thename is in the title, to whose opinion I wholly enchies having often found bim in our naturall fearch for simples in fundry places to be one of singular judgement

simples in sundry places to be one of singular judgement where he had the knowledge of it by Nunnez Brandon, a sateprience; the other was sent me out of Portugall, where he had the knowledge of it by Nunnez Brandon, a lover of rare plants, and therefore according to his title of Lugadom pallidum, he added Noning Brandonin, by which make it hat beene knowne to others, and I now thinke size referre it to the other.

The Vertnes. We have yet learned nothing concerning their faculties.

CHAP, XI.

1. Arachidna Cretica. Vnder ground Candy Cicheling Peale.

His pulse (which for the wonderfull growing thereof hath amazed some, and made them search if it were not mentioned in any former author (as I shall shew you by and by) rifeth up with divers stalkes, about a spote high, having on them both winged leaves, that is, eight or tenne fer on both sides, of a middle ribbe, ending in a classer, very like unto Lentills or Verense, very variable or differing one from soother, for some of them are smalled, others a little round, and some stalkes will have but two leaves, either round or pointed, and others will have foure: the slowers are of a reddish purple, standing singly at the synt, which afterwards yeeld small long cods begger than those of Verches, wherein lie source or sittle round, and very blacke seede: the roote is composed of many small pods, as it were like unto Lentill, cod, hanging by small strings, wherein is contained in some one seede, in others two, in some very blacke, mothers pa'er, and in others of differing colours, or partly coloured; each whereof being planted a new will small beare a plant like the mother.

2. Arachus fab terra filiquifera Enstranca. Portugali underground Peale or Cichelings.

Somewhat like unto the former have we received from Fortugali another fort hereof, whose stender branches bing not much above a foore high, tying for the most part upon the ground, had many small narrow the account order up to the toppes, where and writt the leaves also come fouth small reddish showers which une into small code, containing small round seede within them: the foote shooteth downe right with many shouthers, and at the head of the roote, as also at the other parts spring thicke and flaort which posts, especially while they abide under ground; but changing the extra afterwards, containing within them one or two seedes whench higher the solid under ground; but changing the extra afterwards, containing within them one or two seedes whench higher the solid under ground; but changing the extra afterwards, containing within them one or two seedes

incimento small code, containing small round seede within them: the foote Thooreth downe right with many shoutherest, and at the head of the roote, as also at the other pairs foring thicke and fact whitish pode, especially while they abide under ground; but changing darker after wards, containing within them one or two seedes whemost, bigger by much than those in the pods above ground, and somewar speckled.

3. Arachus into modern amount, Vindergraund Cicheling of Asserties or Indian Earthnuts.

The ladius Earthnuts (the fighte whereof Ligher you, together as they are termed to us by them that have loogly them us) are very likely to grow from first little plants at are formerly described, not onely by the name buty the fight and taste of the thing it selfe. So we have not yet seemed to use of above ground, yet the man, or rease-code (as I may to call it) is farre larger; whole once hunke is thicke and somewhat long, round at the or the code of the code.

The Theater of Plants.

The leffer wilde Cicheling Peafe.

Araculis minor Luftemiens

at both ends, or a little hooked at the lower end, of a fullen whitish colour on the outside, striped, and as it were wrinckled, bunching out into two parts, where the two nuts (for they are bigger than any Filberd kernell) or Pease doe 'lie joyning close one unto another, being fomewhat long, with the roundnesse firme and folide, and of a darke reddish colour on the out side, and white within talting sweet like a Nut, but more oilv.

The Place and Time. The first was fent out of Candy by Honorius Bellus, who found it growing there among corne & Pulle, unto Ioannes Pona of Verona, who fet it forth in the description of Mount Baldm, and flowred in the end of Summer, as the second did that was sent us from Lisbone by Beolius, and the last groweth in most places of America, as well to the South, as West parts thereof, both on the maine and Ilands.

The first is truely taken by Bellus, aforesaid, to be the Arachidna (or Arachydna as Columna hath it) or no deduce o wil. Aracoides, or Araco fimilia of Theophraftus mentioned in his first Booke and eleaventh Chapter, no other plant yet knowne, agreeing so rightly thereunto, and describethit, but the fruit groweth as much neere under the ground joyning to the small fibres thereof as above : and yet he there faith alfo, that neither of them beare any leafe, nor any thing like leaves which how this can stand with sence and reason I know not, and therefore many doe suspect the text to be faultie, or else he is contrary to himselfe, for he faith they beare no lesse fruit under ground than above, and then they must beare fruit above grounds which how it can be without leaves I fee not, for I never read, heard, or faw, that any plant bore fruit above ground without stalkes and leaves; the comparison un-

1, 2 3, Arachidaa Cretica Honorij Belli: Sab tera Si. quifers Lustranies, et . Americana magus.
Vader ground Peafe or Cichelings of Candy, Paragel, and a great kinde of simpries.

to Aracus also carrying the more probabilitie: but fure-ly he was misinformed by those that gathered thorootes with the fruit on them when the stalkes and leaves were withered and gone, he never feeing the plant, as it is likely, or gathering it himselfe: the etimological sofths name being composed of A configuration, Arachi and hudnen, which is tuber, confirment a supposal in me, that he meant this underground fruit was like the fruit of the foregoing Araem above ground, and such like is the under ground fruit hereof in cods with pease in them a but Columna maketh the Terre glandes before declared to be rather this Arachydna, both from the folid rootes under ground, and the likenesse of the plant unto Arach 1 and forely it may be that both these were meant by Theophrass was for he maketh two forts, and both asks in bernig fruit under gound, that is, Arabidna and Arace simile, or Araceides: and we have also two plants, as I here shew you, Aracm before this, and Arachm after it, unto which they may be referred: the other two forts are entitled as I thinke it sittest for them: the Candiors, as Bellus saith, call the first ayes source. Agriculture of the conditions of the condition of the c me by the name of Lasbyrus fub terra filiquifera; the last is generally called by our English Sea-men that goeinto those parts Earth-nuts, erroniously enough, as they doe most other things that they there meete with. The Vertues.

There is no propertie found out wherewith this is invested that we can understand of as yet.

CHAP. XII.

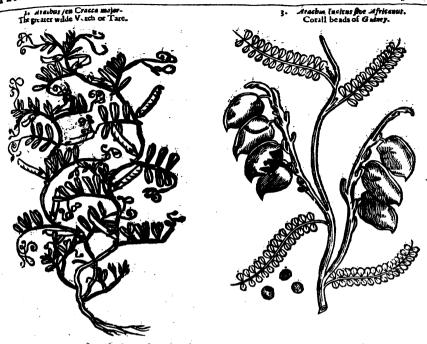

Arachus five Cracca. Wild Vetches or Tares.

F these wilde Vetche there is a greater and a lesser knowne differing from the manured kinde, or hole referred thereunto, whereunto I adjoyne another stranger. I. Arachus five Cracca major. The greater wilde Vetch or Tare.

This greater kind of wilde Vetch hath a few flender crefted stalkes lying on the ground, if it finde no

thing whereon to rampe, or take hold of; at the joynts come forth winged leaves, that is, many fet onboth fides of a middle ribbe ending in a clasper, but lefter than those of Lentills, or the manured Verch; the fourth purple like the Vetch, and grow usually but one at a joynt, after which come small long blacke cods, less than Vetches, and so is the seede within them, but round, and not slat as Vetches are: the soote is small and positions.

This other wild Vetch different in no other thing from the former but in imainetic, except that this hash will tilh flowers standing in mire at the toppes of the stalker, and the code that follow are shorter and somewhat his? and the feede within whitish : the roote hereof hath small whitish kernells hanging among the fores.

. Arachus Indicas sive Africanus. Corall beades of Guiney. This brave plant too tender for our climate groweth like the former but with more store of leaves and flowers addition, ten or twelve growing together in thicke, short and rough brownish red cods, the Pease within being roudifi and as red shining as if they were polished Corall beads, but with a blacke spot on the one side as hard shoot as aftone, and enduring being ftrong for braceletsa long time. Lobel long before Claffon fet out this plant whose pod with the secde being misset is in the next Chapter.

The Place and Time: Both these sorts are often found in the fields among Corne, where they will in a rainy time quickly overspread and thoke the Corne or any other herbe it groweth by, they flower in Infrand giveth feede prefently after, the other came out of Africe towards the Indies.

The Names. This is lightly adjudged to be acones Arachus of Galen and the other old Greaten writers, and hath his name according to the nature, for as Lobel defineth it as a cit quast peffer permittief que legiminos fragia unde deses: The two of the generally called by all authors Aratm or Cracca except Tragm who calleth them Ficia major and minor, of quara and quinta, and Dodonaus that thinketh it may be that kind of Pulle growing among Corne which the Greckes call espace Arachie, and contesteth against Fuelfius and others that called it Craces the especial note such the of difference from the other sorts of Feeches somewhat sit the last is mentioned by Classics in this south booke of Exoticks and 19. Chapter by the name of Ticia Africana, and Lobel Pifum Coccineum Americans.

The Vertues The properties of these are referred to the other forts of Ferchies and therefore I shall put you over to the end of the next Chapter to be informed thereof to avoyd a double recitall of one and the fame thing, onely this is a traine knowne Pulle to Doves wherewith they are much delighted, and although they be wild yet where the Dovehales are ferved herewith they also will refort and become came with the rest, and therefore some counmy people knowing it fow fome fields therewith to ferve to that use.

CHAP. XIII.

Vicia. Vetches or Tares.

The Verches are of divers form some manured or fower, others wild growing in woods or hedges befides those before specified which shall be declared in this Chapter.

T. Vicia very stiva. The manured Verch or Tare.

The manured Verch or Tare hath divers square stalkes rising sometimes two foote high, entanging themselves one with another that they stand in the field without neede of any other proppe, the

TRIBE II.

leaves are winged thicker fer together then the former wild kind or fet on both fides of the middle ribbe, the end whereof runneth out into a divided clasher and are larger also then they; the flowers stand two together and are long and narrow of a darke purple colour, and the cods that succeede them are long and somewhat broad, wherein lye five or fix flat blackish seede and in some gravish : the roote is itringy and perisheth every yeare.
2. Vicis saive abs. The white manured Vetch.

This other different not from the former in growing but is renderer, the leaves not fo thicke and the flowers and fruit more white.

3. Vicia maxima dumetorum.

The great wilde Verch of the hedges.
This great Verch groweth like the former, but is larger both in nu ner and file of the leaves: the flowers likewife are fomewhat large but the reer and more wan or pale, the code fueceeding are thor-

ter also and blacke and so are the seedes within them.

4. Vicial fluestria alba. White wild Vetches.

The white Vetch groweth in forme like the other but the winged leaves have a hoary downe upon them, the flowers are white with darke purple veines running through them, the feede is flat as the other but the roote hereof liveth as many of the wild kindes doe.

The tufted Vetches hath fuch like trayling branches as the office bure but Wesker, the winged leave ar more in number 12. 20. or more on a ribbe, longer and narrower then the former, and flanding more upright, uday alwayes fet opposite one to another but unequally, the flowers likewife than upon the long rated bothlice. are more in number (ometimes twentie together but fmaller, formewhat like tinto the flowers of Onibritis Code head, and of a bright blewish purple colour, and sometimes of a darke purple with some white in them thems fucceeding are long and the feede blacke within them: the roote creepeth under ground farre about, flooring new branches every yeare for the old ones perish.

6. Vicia Slueftris vulgaris. Strangle Tare or Tyne. The Strangle Tare groweth like the former Tares but is rougher both in leaves and stalkes it is smaller alload not to high, the flowers are purple and the cods blacke, fmall and long with many small feedes within them: it rifeth every yeare of it owne fowing, and choketh the Corne or any other herbe it groweth neare.

1. Vicia vu'earis fativa. The manured Vetch or Tare.

Silique cum femine arach micirale.
The pad and feede of the red has Vetch or Corall beade,

. e Place and Time.

The first two forts are fowen in fields as Beanes and Peale to ferve for cattells foode, both in our owne Land The introduction in recently the poore are forced to make their bread, and are fowen and reaped when the money, were Some of the other wildekinds are also found in woods and moist ground with us, among hedchrumens; but the Indian kind as Mr. Gerard tooke it to be in Germany as it is likely. The Names.

Gulahis Bluer Bicium of the Affans his countrey people is generally raken to be Vicia of the Latines, a vinciendo Gun his pure Diction of the Latines, a winciendo will have it: those of the Latines, a winciendo will have it: those of Athens, called it or exter and water Syracum and Cyamum: the first is called Aphace with the first and the second specially were formerly taken for Orobus by the Apothecaries, and with the second specially were formerly taken for Orobus by the Apothecaries, and in the first is called Aphace by Kinimins and both it and the second specially were formerly taken for Orobns, by the Apothecaries, and it out the first is called Aphace by Kinimins and Doctors both in the upper and lower Germany as Brunfelius and Tragm doe shew, and now over high all of the proper and lower Germany as Brunfelius and Tragm doe shew, and now over high a life which be the proper and the proper and lower Germany as Brunfelius and Tragm doe shew, and are over high a life which be the proper and be upper and the proper and be true or the proper and the proper and by the hame of Fisher Indianan, & is fet forth by the name of Vicia India friends which she which German had by the hame of Fisher Indianan, & is fet forth by the name of Vicia India friends and a mundi, and because Guini joyneth Aphaca with Union diversed the solution of the cause of the first she to the first of the shear of the The Vertues.

lithele besten by meh (as Galen faith in time of dearth as fome did when they were greene) they veeld a lithte person by the transfer and the first the second and the belly, and therefore fit to breede melantholy, at melethereof is used with other things to stay running Vicers and Cankers that are ready to Gangrene: and mdeinto a Pultis and layd on the belly they binde a laske.

CHAP. XIIII.

Lupinus. The flat Beane or Lupine.

Aving finished the number of climing or ram-less, ping Pulfes, it remaines to shew you the rest which have no classers and first to begin with the Espine or star Beane, for the great Garden shape which should stand in the fore front I but should stand in the fore front I but should stand in the fore front I

mile to give you fome of their Figures here.

1. Depines farious albus. The great white Lupine. Thegreat white Lupine rifeth up with a strong upright but hollow toft or woolly stalke fer confusedly with dim fort woolly leaves upon long footstalkes, each being field into five, seaven or nine severall parts, narrow long adioft, greenish on the upper fide and woolly undermainestalke dividerh it selfe into two parts, after the flowers are growen from the uppermost joynt, and are Meuntothe great Garden Beane but wholly white withowany for, the branches flowring after the first flowers laregiven flender long foft or woolly cods, leffer then of the Sarden Beane, conteining within them foure or five flat white leanes somewhat yellowish within and very bitter intale: the roote is somewhat long and hard with divers breamexed thereto perishing yearely.

2. Lupiums alter albus. The spotted white Lupine. This other Lupine differeth from the former in the greatreferred in the flower which is spotted with blew, on the bead of the innermost leaves, and the hollow of the

> 3. Lupinus minimus caruleus. The fmallest blew Lupine.

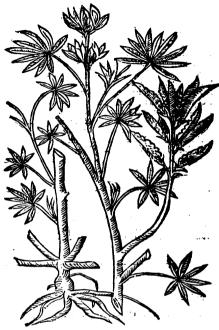

This small Lupine is very like unto the former blew Luefer forth in my former Booke, in the manner of growbeing little or nothing woolly also but smaller both and leaves, the flowers likewife are wholly blew. they, or very feldome with a white fpot in it: the feede smaler likewise and a little spotted.

Faba majur bortenfis. Our ordinary Garden Beane.

Lupinus flore lutco. The vellow Lupine.

1. Lupinus fativus albus. The great white Lupine

. I upinu s minimus caruleus. The fmalleft blew Lupine.

6. Lupinus medius caruleu A middle fort of the great bleve Lun

The Theater of Plants.

4. Lupinus Gadensis marinus flore caruleo. The blew Sea Lupine. This for Lupine is formewhat like unto the fmaller blew Lupine described in my former Booke, but leffer, or This Sat Lupine is and the fmallest blew last of all described a the flower is of a most excellent blew colour, with some butters it and the second is freely in the freede is small and round. beween it and the research of the fact of all deferit

white foot in them, the recue is this and round.

7. Lupinus Arabicus. The Arabian Lupine:

Having well confidered this Lupine, I finde that I have deferribed it among the Cinquefoiles, became the leaves Having wen connected the support of the leaves that having reade Pons his de-dionet retemble a Cinquefoile, and comming to me by that name, but fince that having reade Pons his dedeforcer retemble a company and community to the by that name, but time that having reade Pona his detopping of Mons Bauldus in the Italian tongue, I finde it there described by the name of Lapino Arabico, or if you
will progrino; unto either of which it may be referred, but seeing it doth more resemble a Lupine
will progrino; they to entituled it here, were referred you a backer of the doth more resemble a Lupine vil. Pringue pring I have so entituled it here, yet referre you to the description thereof in that place, because that Conquerone, i have to the control of the feether set of the celestration thereof in that place, because i sould not repeate that there set downe, being, as I tooke it growing in my owne Garden, but yet because in southings it is defective, as in the cods set, and might be bettered, I will from Pons supply it: the lease doth southings it is the set of the s for programme a Lupine leafe, the flowers are more purple than they shewed with me; and the middle pointell in harminate a second and pointed at the ends, full of fmall blacke feede and little : this I thought the muon purper, and the they are but one plant, although it hath two titles. 6. Lupinus Indicus medius caruleus. A middle fort of the great blew Lupine.

This fact of Lupine is very like the greatest blew Lupine described in my former Booke, both for the tallnesse. This into a superior of the leaves, or a little leffer in all as the flower is also, and of as orient a blew co-WOULDEN, and whirth foot in the middle, which changeth to be reddiff before the flower decaieth: the Dods but, wars woolly, and almost as large, and so is the seede also, but still smaller, and a little discoloured, with a or or hallownesse in the middle.

int of Inflowments and the Laplace flore carnes. Blush flowred Lupines.

Somewat like unto the last is this Lupine also, but lesser and lesse woolly: the flowers which make the chiefest difference, are of a kinde of delaied reddish colour, which we usually call a blush: the pods also are lesse woolly nd smiller, and the seede likewise.

8. Lupinus flore obsoleto.

Wethrehad another fort of Lupius fent us from Boel by this name, but perishing in an intemperate yeare, we medicibe it no further.

The Place and Time.

Thet Lupinës grow naturally wilde, but wee doe nourish them all in Gardens; and doe flower in the end of lungin duguit, in which time, or quickly after the frede will be ripe. The Names.

his alled in Greeke signe Therman, in Latine Lupinus; Pliny thinking it tooke the name and qualitie from Lupi, but I finde no likelihood in that supposition, and therefore forbeare to expresse it any further; the two interfocaled by the Authors that have written of them : the third was brought me by Boel out of Africa, and the forth out of Spaine, but were both fo tender, that I onely faved a little feede the first yeare. I had them. and hat lift them fince: the fift is declared in the description : the three last have not beene remembred by any tefore: the Arabians call it Tarmus or Tormus; the Italians Lapino, the Spaniards Entramofos, the French Lupin, the Cormans: Figbonen, the Dutch Vijchboonen and Lupines, from whence came the Faba ficulnea Germani by Litel : and we in English Lupine or flat Beene.

lipines by reason of their bitternesse, do open, digest, dissolve, & clense, being steeped some daies in water, untill they have loft their bitternesse, they may be eaten, & fo are, as Galen faith, for necessitie, but they breede grosse and catchamours, are very hard to digeft, and flowly paffe through the body, yet doe they not binde any fluxe : the backeing to freeped, and afterwards dried, beaten, and taken with some vinegar, taketh away the loathing of at homacke to meate and provoketh the appetite the decoction or infusion of Lupines taken with hony and ringer killeth the wormes in the belly but if you mixe Rue and Pepper thereto, you hall make it the more effethe meale or pouder taken with hony and vinegar or in drinke doth the fame : the faid decoction taken which the obstructions of the liver and spleene, provoketh urine and womens courses, if it betaken with the dead childe: the decoction of them cleanseth all scabbes, morphew, cankers, tetters, and imping or running ulcers and fores, and boyled in lye it clenfeth the head from ulcers, fourfe, &c. breeding brim it also clenicth the face, and taketh away the markes that the Poxe doe leave after their healing, and all who markes, and blacke and blew frots in the skinne : and to cleare the face, and make it more amiable, many women doe use the medic of Lupines mingled with the gall of a Goate, some jayor of Lemonds, and a little them away pimples, and feattereth the nods or kernells that rife in the body, and breaketh carbuncles and implanes: the burning of the huskes driveth away Gnats, Flies, &c. whatfoever. The wilde Lupines are stronger more effectuall to all purpofes.

CHAP. XV.

Cicer fatiums. Garden Cich Peale, or Rammes Ciches.

Fibe Pulse cilled Gierr, there are two forts, the Garden and the wilde, but although I gave you the deteription of two or three form of the garden kind, in my former Booke : yet I thinke it not amife to give you the descriptions of them bere againe, with their properties more amply.

Coor factum five aristissim rubrum nigrum vel album.
Garden red, blacke or white, Cich Peafe, Rammes Ciches, or Cicers.
Albe forts of Rammes Ciches, bring forth stalkes a yard long, whereon doe grow winged leaves that is

many finall and almost round seaves dented about the edges, fet on both fides of a middle ribbe : at the joynes come forth one or two flowers upon thort foote stalkes, Peafe fashion. cither white, or whitish, or else purplish red, lighter, or deeper, according as the Peafe that follow will be, that are contained in small thicke and short pods, wherein lie one or two Peafe more usually, a little pointed at the lower end, and almost round at the head, yet a little cornered or sharpe: the roote is small, and perisheth yearely.

2 be Place and Time.

They are sowne in Gardens, or the Fields, as Peafe, both in our owne and other countries, being fowne later than Peale, and are gathered at the same time with them, or fomewhat after.

The Names.

It is called in Greeke egefirdos Erebinthus and ngids is added of some because 1913s is areis in Latine Cicer, of the Arabians Chemps Hamos, or Alhamos, of the Italians Ceci, of the Spaniards Gravansos, of the French Ciche, & pois Ciche, & pois bechu, of the Germans Kichem and Kicherebs, of the Dutch; and we in English Cicers, Ciches, Rammes Ciches. and Ciche Peale: Dioscorides, Theophrastm and Pliny doe much vary one from another in ferting downe the forts of thefe Cicers, Diofcorides divideth it into fativum & fylvefire, & of the fativum he nameth Arentinum to be the other fort ; Theophraftus faith it hath many differences as in greatnesse, taste, colour and forme, as Arietinum and Columbinum, &c. Pliny doth somewhat follow Theophrastus, and maketh more forts; but to avoid long difputes and controversies, wee doe now generally hold but two forts of the manured Cicers, white and red, or three, at the most as Marthiolus faith white, red, and blacke, but the red changeth blacke with time, and therefore is not differing ; Co-Limbinum and Venereum are all one with the white; and the Cicer Ocobeum of Theophrastus & Pliny, is another plant, as shall be shewed hereafter : Matthiolus faith, that the Germans heretofore erred much in taking Peafe to be Cicer Columbinum, we have shewed before that Tragus and others tooke Vetches to be Cicers.

Cicer ferinum five arietinum nigraminis Garden red, blacte, or white Cich Rammes Ciches, or Cices

The Vertues.

Cicers, as Galen faith, are no lesse windy meate than Beanes, but yet nourish more, they provoke ventry, and is thought to, intrease sperme, and therefore they give it their Ralion horses. Ciers have in them a more clenfing faculty than beanes, whereby they breake the fonces gathered in the kidneyes; to drinke the greater them being boyled in water, is the best way, is moveth the bely downeward, provoketh urine, and woman courses, and increaseth both milke and seede: the decoction of either of them saint Disseries, mad with Rosemary, is good for the Dropsie, and the yellow laundise, and to ease the paines in the sides, for which profe this medicine is very powerfull; an ounce of Cicers, two ounces of French barly, and a small bandful of Marsh Mallow rootes, cleane washed and cut, being boyled in the broath of a chicken, and source taken in the morning, and fasting two houres after : the white Cicers are used more as meate than medicine, yet they have the fame effect, and is thought more powerfull to encrease milke and feede: I have knowne kgiven with good fuccesse; to women that were barren through an over hot constitution, an orderly course proceeding and following the taking thereof. Pioforides faith that Cicers are hurtfull to those that have ulcers in their remes or kidnies, or in the bladder. Flatarch giveth this note, that no wormes breede in these Cierr, when stall other pulses are subject to them, and therefore in their nuptiall ceremonies, those were given in an allegerical fent, of their mutuall incorruptible affections.

CHAP. XVI.

Cicer Sylveftre. Wilde Cicers.

He wilde Cicers are of three or foure fundry forts, as shall be shewed in this Chapter.

2. Cicer Speaker major. The greater wilde Cicer.

The greater fort hath very long winged leaves set on the stalkes, composed of many, every one of them being small, and longer than of the former garden kinde, not dented at all about the costs and of a lad greene colour at the toppes of the stalkes come forth many third of the stalkes come for the stalkes come forth many third of the stalkes come for the stalkes come for the stalkes come for the stalkes come for the stalkes when the stalkes will be stalked to the stalked the stalked the stalked the stalked that of the stalked the st He wilde Cicers are of three or foure fundry forts, as shall be shewed in this Chapter.

Cicer stoeffere major: The greater wilde Cicer.

7. Cher stueffre tripbyllum.
Three leafed wilde Chers.

the month hard and wooddy, yet formadeth farre about and living long. There is another fort in all things like the former, but much lefter in every part.

2. Cher man amount of the man annual Lanaginofum, The woolly mountaine Cicer.

This mountaine Geor hath upright round stalkes a foote high, and fost or woolly, branching forth into small backes, whereon stand wings the leaves, venne or twelve on a side of the middle ribbe, with an odde one at the wants, whereon tanid wings reases, tenne or twelve on a jude of the middle ribbe, with an odde one at the mid subwire of file of reason the Vetches, fome broader and narrower then others: on the topes of the branches fand a fpike of reagh pale coloured flowers, and the cods that follow are fomewarding and woolly with a theological thread at the end of them, and have small blacke seede in them.

3. Civer workers with a the root growing deeps if the rocky ground where it groweth hinder it not, from the findry hairy soothalks of leaves which are 12, or somewhat more on a side, somewhat round yet longer with the code of the rocky ground where it groweth control of the code of the code

manufer of the Carlet Cier, the edge of them being hairy. Some of them being equally, others unequally set exiginft another, and an odde one at the end; the flowers grow hard above the toote, being somewhat long and would after them comed wolfen code, having two partitions, full of small yellow seeds like unto those of the Makes that is Kidney fashion.

Cicer Alpinum. Mountaine Ciche Peafe. This from a long trace paragraphic for the feaves on the stalkes like the true Cicers, but rounder and dented: the sower are blewish and the feaves on the stalkes like the true Cicers, but rounder and dented: the sower are blewish and the feaves on the former, being somewhat hairy and groweth on mount

The three leaved wild Comparts the lakes about two foore high divided into some branches spreading abroad, whereon are fet upon long four talkes about two foore high divided into some branches spreading abroad, whereon are fet upon long four talkes on the bown another, leaves divided into three parts like the wild Trefoile slight of them bigger, this like and rounder then those of the Garden Giver, a little dented also about the edges:

the lower grow two or three together from a long footstalke at the joyms with the leaves, which are like the

Georgian flowers but larger, the code that follow are small like unto the Garden kinde, but somewhat flat
the foot of the same at the bottome of them, within which like much smaller seede and more flat; and

the property of the same became the same between the least of wild Cicer.

Misoner wild Cicer has a thicke tone branched same health without and white within; the stakes are

this other wild Cierr hath a thicke long branched roote, blackifh without and white within : the stalkes are of branches with leaves ilke unto Givers, but three alwayes fer together and no more; the flowers are red like unto the other wilde Givers but hairy and spotted with red spots.

The Place and Time.

All these forts grow upon hills and in the woods, and sometimes by the hedges in fields, and sower and grow and sometimes by the hedges in fields, and sower and grow fruit in Iuly, August and September.

The Mames. The first is the Cicer sylvestre of Matthiolus, and so called by Dodonesus, Lugdunensis and others, being the Cier sylvestre herbariorum of Lobel, and is also the first Cicer sylvestre of Dalechampius, and the Cicer specific minute. fylve tre herbariorum of Loom, and is and the title live film his least kind : the second and third bee basing out of his fredrems : the fourth is not mentioned by any before : the fift is the Cicer freories wint of his and called by others Lier, forefire alterum : the last is the Cicer fylve fire fecundum Dalechampy by Inch. The Vertues.

The wild Cicers are fo much more powerfull then those of the Garden, by how much they exceed them heate and drynesses by their startes and more bitter taste, whereby they doe the more open dismissions, provoke urine, breake the store, and startes and more bitter taste, whereby they doe the more open dismissions, provoke urine, breake the store, and startes of cutting, opening, digetting and distring that are attributed to the former and that are attributed to the former and that more specially and more certainly; yet saith Phy if they be no largely taken they looken the belly and cause to ments and breed wind.

CHAP. XVII.

Orebus. The bitter Vetch.

F this Pulse there are properly in my judgement but three forts which shall be declared in this Com tersbut unto them I will adjoyne that imall wild pulse for the names fake that is called Eron fil vestre, or Catanance. 1. Orobus vulgarie. The ordinary bitter Vetch.

This fanall pulle shooteth forth divers weake slender branches leaning to the ground, and tories. fing up about a foote high, befet on all fides with many winged leaves, each whereof is very little, and line longer then round fet one against another as the Cicers, Vetches and divers other Pulses are, the flowers are fall and whitish (for I never faw any purple) standing singly every one by it selfe at the joynts with the leaves, the which come small round long pods no bigger then the tagge of a point, bunched out in three or four put where the feede lyeth, which is almost full round small and of a pale colour : the roote is small and principal every yeare.

3. Orobus Creticus. The better Vetch of Candy. This Orobus in the manner of growing is altogether like the former, but whereas Matthiolas and otherfol-

> 1. Orobus wulgaris herbariorum. The ordinary bitter Vetch.

3. Cierr Orobenn: Cornered Orobus.

TRIBE II. long him say it is leffer, I have alwayes found it to be rather larger then leffer, yet there is so little diffrembetweene them, that but for the names fake of would make them both but one kind without

3. Cicer Orobetimo. Cornered Orobus Diren would rather make this a Cicer than an Orobus. ad indeede Label and Pens much doubted, whether bey hould call it the first of Diescorides his Cicers, alboghthey were confident that it was Plany his Civer. he was the fweetest and likest to Orobus : but I rather restricted the kinds of Orobas from the forme of the manage like to Orobus whose description is thus. It nichup with a crooked or leaning hollow stalke halfe a yard high and full of joynts fet with many leaves on which are somewhat long like the the the Lentill; at the joynts, towards the motione forth long footstalkes, with many flowers set on them close together, which after give long and round cods, bunched out and dented in betweene where the fedes lye twife as bigge as those of Orobus a little ometed and not fo round, of a pale or yellowish glour and differing little from them but in the darke

4. Eroum Sylveftre five Catanance. Wilde graffe leafed Orobus.

This wilde Pulse hath fundry branches rising from the roote neare two foote high especially if it grow in any fertile foile, befet unorderly with many long and mowdarke greene leaves finaller then divers graffes, athe toppes of the stalkes and branches grow pretty lare Peale Blossom'd flowers of an ordent thining Crimion colour, after which come fanall flender long and almost round cods, conteining within them divers had blackish seede : the roote is long and slender, with fone fibres thereat, and perifheth every yeare as I gheffe by those that grew in my Garden from the seede sowm, whereof some bore white flowers and then perified rowards Winter.

4. Erum pluette fre Catalance. Wild glaffe leafed Orebus.

The Place and Time.

The two first are onely noursed up in Gardens with us, the second being naturals of Candy: the third as Lobel subgroweth wild in Narbone and Province in France; the last is usually growing in the fields about the hedges adbulhes towards High-gate, Paneras Church, &c. and are all flowring and feeding in the end of Summer.

The Names.
This is called in Greeke de 1999 Orobus mace to he farth of the Names.
This is called in Greeke de 1999 Orobus mace to he faith, in Laine Eroum and Orobus also the first is called Orobus five Eroum by Matthiolus (who faith it was but lately inhitime made knowne in Isaly) and by most other writers, onely Dodoneus calleth it Cicer fativum and Mothe when as Moches indeede is this Orobes but not Cicer, Lobel calleth it Orobes receptus herbariorum, because the generall vote of these later times doth so call it not having found or knowne any truer: the second is called Orbin Creticus by Matthiolus, as if it differed from the former, but is not fo as I have shewed in the discription beforesthe third is called by Lobel Cicer Orokeum Theophrafti, St by Banhinun Orobus semine obsuso triangulo. The If is called Catavance by Gefaer in borsis, by Dodoneus in his French Herball and Lugdunenfis: but Ervum Glue-In by Dodoneus in his latine Pemptudes and Ervum / lvestre berbariorum by Lobel: but why Baubinus should chit Lathyrus filvefiris minor I fee no cause feeing it is not like any of the other nor hath no claspers as all the othe Labyri he there expresseth have, and besides breaketh that order he had proposed to follow, namely to fer downe all such Pulses as had claspers in the first place, and then those that had none, and yet this having none. ispur bove among those that have because he would vary the title if he could by any meaner: It is called by the Mahans Erbum Keifene or Kerfene, by the Italians Ervo, by the Spaniards Iervos, by the French Ers, and wee in English may call it the bitter Vetch, for Pliny confounds this with Vicio the Vetch, and from the quality of bittractic which the ancients say is in it, although ours have little that can be perceived or Orobas after the Lathe if you will.

The Vertues.

Order, is dry in the second degree and hot in the first, and by the bitternesse cutteth clenseth and openeth obandions, and was used in Galess time as hee faith to be steeped like Lupines (and that was to take out the birsmesse) before they were eaten by men or given to their beats, and that but in a dearth and great necessitie, beats they are not onely very unpleasant to the taske but be of bad nourishment. Wee use saith Galen the Orowish Hony as a medicine to clease the breast and Lungs of thicke humors that offend them, the manner of headents preparation of the meale thereof was in this manner: being steeped in water a good while they after and or parched them untill the rindes broke, which then being ground and passed through a boulter they keepe this mede as of great use, both to move the belly downewards and to provoke urine, and to canse them that diktobe of a good colour, yet if it be two largely taken it canfeth headach and paines in the belly, and canfeth

blooddy urines. Pliny faith it is recorded in the Emperour Angultus Epiftles that he was cured by Evrin (abb griefe it is probable was tough flegme, condenfate in the Lungs and hard to be avoyded and fait forth) this Order pliny faith that good authors doe affirme that if any take Orobus fasting every morning it will confine the pliny faith that good authors doe affirm the boar cleafeth foule Vicers, and taketh away the flower than the plant of the plant o Pliny faith that good authors doe affirme that it any take four views, and taketh away the spot fielders the species can be specied with hony clenses four fielding for fielding for the species for the speci Spleene: the meale hereof mingled with nony cientern four vices, and taken away me ipot fieldern other discolourings of the face or other parts of the body: it suffereth no Cankers, Gangrenes or freeding ting fores to breede in the body; it molifies the hardnesse of the breads, and taken in wine or vings a limit of the breads. ting fores to breede in the body; it motinetn the naturelle of the octable, and taken with Vinegar it beliefs the fight it helpsth the birth see on doe nothing. faith it helpeth the bitings of Serpents and mad dogges and men, and taken with vinegar it neipeth the first gury, and that difeafe where one doth oft defire to goe to the Roole but can doe nothing, the faid parched mixed with hony and taken helpeth those that rellish not their meate, and are bickockly disposed that is red to fail into the heckicke Heaver or Consumption: a creame made of the meale of them & the place block that is the place before the meale of them are not a neither with business that who have been and made into a neither with the same than the place before and made into a neither with the same than the place before and made into a neither with the same than the place before and made into a neither with the same than the place before the meale of the meale o that is troubled with an irch cureth it through the whole body, and made into a plaster with wine will brite Carbuncles if it beelaid thereon: the greene cods stalkes and all before they grow hard, being build together juiced and applied to the haire doth colour it blacke.

CHAP. XVIII.

Orobus Sylvaticus. Wood or wild Orobus.

Ext to the true Orobus I thinke good to joyne the wild or wood kindes for the names fake, and is

This first tiped all along : the leaves that are fet one by another on each side of a middle ribte being fix, eight or ten in number, are a great deale larger then any Orobus namely two or three inches long, and in inch or two broad, with three increases or fine wes running through them: the flowers grow at the topper may inch or two broad, with three nerves or mowes running through the inch was grow at me topper many flanding together in faffing no fa fpike or bush being larger then those of the Vetch, and of a daintie blewish pule colour, and when they begin to fade they will change their colour a little and become more pale, then follow small long slender bidwine cods with small round seede within them yet sometimes they will be more long then round and variably coloured: the roote is long blacke and hard, bunching forth in some places with some finall long strings and fibres fallned thereunto, and liveth many yeares.

2. Orobus fylvaticus annums flore albo. The annuall white wild or wood Orobus.

The other wood Orobus hath divers straight and straked stalkes a cubit high bearing stalks of leaves one above another but not opposite, each stalke having four and for etimes sive leaves on them reasonable large and points.

Orobus filvaticus purpurus major. ted at the end with veines running in them: the flowers grow at the toppe from the uppermost joynts, five or fix standing together on a short stalke which looke all one way of a whitish colour : when they are past rise long slender cods like the former, with brownish but larger seede in them then in any of the other forts: the roote liveth not but perisheth after seede time.

3. Orobus sylvaticus angustifolius. Narrow leafed Wood Orobus.

This narrow leafed fort hath flender but straight crested stalkes a focte high, the leaves stand foure on a stalke by couples and are long and narrow: the flowers grow above on long stalkes many together of a pure white colour : the cods that follow are long and blacke, with somewhat large blacke seede in them the roote consistent of five or six long flender tuberous clogs like unto those of the Afphodill of Peony but smaller, blackish on the outside and white within.

4. Orobus fylvaticus Venetus. The Venetian wood Orobus.

This Venetian Orobus is very like unto the first Wood Orobus here described growing in height and forme of leaves nearest thereunto, not having any end leafe on the stalke but of a paler greene colour: the flowers are small and purple like unto them also: the cods are reddish, long and imall with round whitifh feede in them : the roote is hard and wooddy with many fibres thereat and endureth. There is another of this whose stalkes and leaves are paler and the flower wholly white not differing elfe.

5. Orobus Alpinus latifolius. Mountaine Wood Orobus.

This also is very like unto the first fort, but the leaves are broader and have their end not to tharpe, the flowers hang downe and are an inch long, of a pale yellowish colour, the uppermost being somewhat reddish.

t. Orobus fylvaticus purpur us major. The greater purple Wood Orobus.

7W

The Place and Time.

The three first forts grow as Cluffus faith in Hungary, Austria and the parts nearethereunto: onely the fourth walenting Cluffus as he faith from Venice, the fit Baubinus faith hee had from the Pyrenaan and Helvesian bloom to the parts of the Pyrenaan and Helvesian bloom to the Pyrenaan and Helvesian bloom bloom to t hills, they all flower in Aprill or May and their feede is ripe in Iune.

The Names. Alless form are referred to the Orobus, both from their manner of growing and forms of the seed being round, addressore Clusius called them Orobus Pannonicus, and Banhinus Orobus fylvaticus whom I have followed. The full Orobus Pannonicus of Clusius, which Thalius calleth Orobus fylvestris vernus, Lobel as I take nument this by his Phaselus, Lugdunensis calleth it Phaseolus sylvarum, as is before sayd, Dedoneus Arachus within, and Columna Astragalus: the second is the fourth of Clusius, which her slath may well be reterred to familiand of Phaselus, or else some kind of Vetch : the third is Claffus his third fort of Orobus : the fourth is his Order Unetter: I doe verily thinke that the fift which is Baubinus his Orobus Alpinus latifolius, and Lugdunensis is Galego montane be all one, the colour of the flowers in each being like, and the relt agreeing or not farre dilapring from it.

The Vertues. Chambath made no mention that he heard of any propertie did belong unto any of these Pulses among the compression where they grew, but were wholly neglected, yet Lugdanensis saith of his Galega montana that it Was compared availeable against poyfons and the Plague no lesse then the other Galega, and that it was good aguinline falling ficknesse, and would kill the Wormes.

Onobrychie. Cockes-head.

Nothis title of Onobrychia are referred divers plants by many good authors, the most likely whereof I will comprehend in this Chapter.

1. Onobrychia vulgaria. The ordinary Cockes-head. The ordinary Cockes-head hath divers weake but rough stalkes leaning downewards halfe a yard best with winged leaves, each being longer and more pointed then those of Lentills and whitish underhat from the toppes of these stalkes rise up other sender stalkes, naked without leaves unto the toppes, where thre grow many imall flowers in manner of a spike, of a pale reddish colour with some blewnesse among them, which rile up in their places, round, rough and formewhat flat heads: the root is tough & formewhat wooddy,

Minor.

vet liveth and shooteth a new every yeare. Of this fort Banhinus setteth forth a lesser differing act firm a former, but in the smallnesse thereof.

2. Onobrychis spicata flore purpureo. Spiked Cockes-head with purple flowers This Cockes head hath such like weake stalkes lying or leaning to the ground, whereon grow winged leave This Corkes head harn men like weake statkes sying or reasonable with the like leaves on them, and yet like the former, but hairy or hoary: from the joynts rife other branches with the like leaves on them, and yet like the former, but hairy or hoary: from the joynts rife other branches with the like leaves on them, and yet like in former. bove them rife up the flowers in a longer spike or tuft at the toppe of a naked stalke, like in forme unto the object. but of an excellent thining purple colour, with many fmall leaves fet among them, which turne into thou, but and hard heads parted in the middle i the roote liveth as the former.

and hard heads parted in the middle a the roote liveth as the former.

3. Onebrychin floribus caruleis. Blew flowred Cockes-head.

This third Cockes-head rifeth formewhat higher than the former, the leaves are smaller and flotter point. ted : the flowers are fewer, and of a pale blew, and in fome of a blewish purple colour, and beareafter with flender long code foulded double, wherein lie small blacke scede, like unto those of Medica.

Onobrychie folius Vicia longioribus. Cockes-head with long Fetch leaves. This Fitchling hath longer and narrower leaves somewhat woolly or hoary, and more store set oneuch side of This I itching nath longer and narrower reaves somewhat woonly or any service on the contact fide of the middle ribbe; the flowers fland in a large spiked head, being more long than others, and somewhatefield bling the flowers of three leaved graffe, of a pale colour, with darke veines in them: the code that sollow are folded like the last, but the seede which is blacke is cornered or square like Fenegreeke: the roots is woodly and living. 5. Onobrychis quanta Clufy. Mountaine Cockes-head.

This fift fort hath likewise many winged leaves growing from the stalkes, but smaller than theres, and both falkes and leaves though greene, yet covered with an hoarineffer the flowers grow at the tops of but falkes, at the others doe, but fewer in number, and of a purplish blew colour: the cods are long and foulded like the two last: the roote is great, thicke and long.

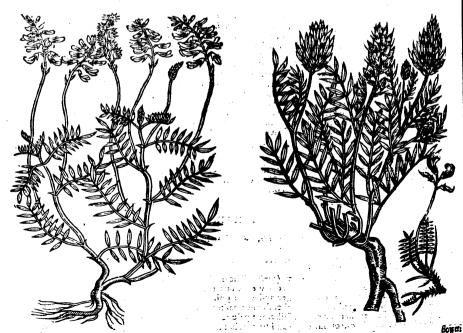

6. Onobrychia globoso capite. Round headed Cocks-head.

This strange Cockes head which Clusius saith, hee first saw in Mr. Riches Garcen, Queene Elizabeth A. pothecarie in his time, was very like the last, for the smallnesse and hoarinesse of stalkes and leave, yet the stalkes were longer, tough and blackish, which lay bare on the ground before it had leave, and then branched it felfe, shooting forth at the toppes short stalkes an inch long, bearing at the topper around head of many flowers fet together, of a whitish colour, somewhat like unto those of Tragacanta, Goststhone; after which followed small cods, not bigger than those of Orobus, containing one seede within, exhibite Fenugrecke.

7. Onobrychris clypeata afteraminor. The leffer buckler Fetchling. The greater fort hereof is fet forth in my former Booke, under the title of Hedyfarum elypeanm, The red Sum

1. Onebrychie vulgarie. The ordinary Coc kes-head.

2. 5. Onobryebis fricata flore purtureo & quarta Clufi. Spiked Cockes-head with purple flowers, and mountaine Cockes-head.

3. Onobrychů floribus carulie. Bleve flowred Cockes head.

flower a but this leffer groweth very low, not above an hand breadth high; the leaves likewife are imall and narrow, the flowers are small, and of an excellent crimfon colour, the feede veffells that follow are flat and rough, containing small seede within them, the roote is thicke and threaddy.
8. Onobrychis clypeata levis.

Small buckler Fetchling.

This smooth Fetchling riseth up but wi hone stalke, or two at the most a foote high, set with joynts, where stand winged leaves, confishing of many smooth long leaves, and an odde one at the end: from the joynts of the leaves, fpring up fmall and long fialkes, whereon the flowers thand in a spike fashion, of a blewish purple cofour, and have afterwards flat and fmooth huskes buckler fashion, three for the most part standing one above another, with small seede within them.

9. Onobrychis minima. The least Cockes-head. This small plant, Pena saith, he found on the hills of Provence, with a small roote downeward, but thicke at the

had, and a thicke barke, having many hairy stalkes, two or three inches long, with small leaves on them like unto Intilisor Afragalus, hoary, hard, and base towards the toppes, and many small pale yellowish white slowers set tegether in a tust of adving taste, like Birds foote. Lobel in Adversaria calleth it Astragalus persimilis palmaria pufila planea.

The Place and Time. The first growerhunder hedges, and fornetimes in the open fields, in divers places of our Land, but all the rest at Stangers and kept in Gardens with us, by them onely that are curious confervers of rare plants : and flower from the end of June to the end of August, and the feede ripeneth in the meane time.

The Name; .

kingenerally taken now adages by all those that are judicious Herbarills to be the O's sepuxs: One brychis of Dio. nuguerally taken now adayes by all those that are judicious Herbaries to be the Unity the Onetychis of Diodicated and Caput galinacemen in Latine: the first is called Onetychis ty Dodoneus, Clusius, Thalius, and many others, Gianri bortic callethis Glanx fibt Onetychis, Lobel Caput galinaceme Belgarum, Lugdonensis faith it was called by Baubinus in Prodrome Caput gallinaceme miniar the second here is Inhyaliby many, the lister hereof is called by Baubinus in Prodrome Caput gallinaceme miniar the second here is the fill onetychis Pamonica with Clusius, which Pome in the description of Wooms Baldur calleth (icer Afragation the shift in the second with historiche fourth is his third; the filt is his fourth Onetychis, and the fixt his fitter the second with historiche fourth is his third; the filt is his fourth Onetychis, and the fixt his fitter the second with historiche fourth is his third; the filt is his fourth Onetychis. man interned is the lecond with himsthe fourth is his third; the fire is his fourth University, and the first his his third; the firesh is, as I faid before. The lefter fort of that Hedyfaram of peatum of Lobel, that I have fet forth in my form Booke, being generally to falled now adayes with most; and which Dodoness callet Onobrychis altera; and Commission Securidaca elipteata; bits Bankinnas talleth it Onobrychis of peata after a minor, as he doth the next. Onorthis figural levis: the last is called by Lobel, as I faid, Aftragale planta per smiles. The Italians callit Upu-pinal Maghi; the French Baint foint and we in English Cockes-head or Medicke Fetchling.

This Deprines.

Galas faith hereof that it hath a power to rarefue and digelt, and therefore the greene leaves bruifed and laid as a partie differ feth knots, nodes, or kernells in the sight, and if when it is drie it be taken in wine; it helpeth the bragury, and being assointed with oyle it provoketh fweate. Dieferides and Pliny faith, the fame things, and tenderated not be repeated: it is knowneggenerally to be a fingular foods for cattle to cause them to give be of miller.

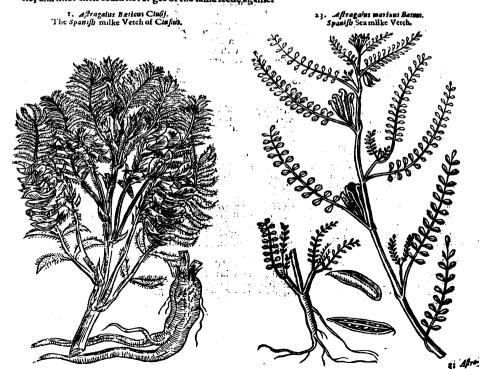

CHAP. XX.

Aftragalm. The milke Vetch.

HE knowledge of the true Aftragalm hath troubled most of our moderne Witten, supply HE knowledge of the true Apragam nath troubard more millised, and therefore in fact acoustic them having fet forth divers plants for it, which others have millised, and therefore in fact acoustic to the second se them flaving ter forth divers plants for it, which occurs a law likely I will endeavour to fusion it is hard to determine of any certaintie, yet the most likely I will endeavour to they re

1. Aftragalus Baticus Clufy. The Spanish milke Vetch of Clufun. This Spanish plant hath fundry stalkes afoote high, of the bignesse or ones little fager big five cornered or crefted all the length of them, hard, fomewhat reddish and hoairy with all the length of them. woolly or hoary many fet oneach fide of a middle ribbe, of an aftringent rate at the first, and afterwards hor; the woolly or hoary many let oneach inde or a mindle rabbe, or an altringent take at the intriand anterwards by the flowers fland at the tops of long footestalkes that shoot out from the joyints and grow into a very long spike of large flowers, each as large as of the Beane or Lupine, wholly, of a white colour when they are blownedges, he of a brownish yellow being in the bud; after they are past, there follow full swollen long cods, of two index and a halfe long, and one thicke like unto those of the wilde Pease, which being shaked when they are discussed in the past of the past round feede in them will make a noise, and being tasted doe instance the mouth and tongue mightily: despote for the smallnesse of the plant is very great, about the length of ones hand, of the thickne of ones arm, and these branching forth into fundry other smaller ones, rugged and blacke one the out fide, and whitish within hard and wooddy, which when it is drie is harder than an horne.

2. Aftragalus marissus Baisons. The Sea Spanis milke Vetch.
This Sea Spanis milke Vetch (which Boelins, brought me, with very many other things at my charge one of Spaine) groweth often upright, and sometimes leaning downe with one or two round reddish stakes, a late hery, fee with sundry winged leaves on both sides of the stakes, one above another, consisting of tenures does finall fresh greene leaves, somewhat like to those of the lesser Sicklewort, from betweene the stalke & the lesser and at the toppes of them also come forth branches of the like leaves in some places, and at others many imiliate coloured flowers, which turne into 10 many three square cleare skinned whitish cods, the inner edge being thin ner, and a little bowing, the other two forming, as it were a backe, dividing it selfe into two parts, with dress small hard yellowish seede within them, almost like Fenugreeke seede: the roote is small, long, and drided, perishing yearely with us. I had from Boeling, above named, another fort hereof which he named Afrequism marinus Bactions supposed, but what other chiefe difference it had from the other, but the leaning to the grandward, I know not, for the plant dying with me that role from the feede, I could not fo exactly observe the trie tie, and fince then could never get of the fame feede againe.

TRIBE 11. 3. Aftragalus Syriacus. The milk: Vich of Syria.

Aftragalus Alpinus clausculatus magno flore. Great flowred mountaine milke Vetch.

Aftragalus Syriacus. Milke Verch of Syria.

The Sprian milke Vetch hath fuch like wake stalkes lying on the ground, or not riling much above it, and winged leaves also, but smaller and shorter: the flowers are larger, and growing into a thicker bush, of an excellent red colour very beautifull, the roote is great and thicke, ipreding about.

4. Aftragalus Alpinus. Mountaine Milke Vetch.

This bath from a fingle roote divers kader stalkes formetimes standing upright, and other whiles leaning downe; thekaves are longer, but more sparingly kt on the middle ribbe than the Cicers, and not dented at all about the edges, but vay neare relembling those of the first wood Orebus: the flowers are like to the Verchor Cicer, of a blewish purple cobar: after which come long pods like to Vetches: the roote is tuberous or

booby, blacke and hard, with other such like smaller peeces growing unto it, fastened by long strings, this afforth much from the Chamebalanns or Terra glandes, which is accounted by Columna, for the true Arachidna

5. Aftragalus Alpinus Claviculatus magno flore. Great flowred mountaine mike Vetch. This hand a long thicke, blacke, wooddy roote two foote long, with some sibres thereat, divided above into the colly heads, from whence rise sindry long winged small leaves lying on the ground, like unto those of locally the flowers are large and grow many together at the toppes of naked flakes, of a yellow colour, faith landmenfu of his, but Bashinus faith, that that which grew with him (if it were the same) was of a purple cater; after whom follow small, long, blacke pods, with a small twining thread at the end like a classes.

7. Aftragalus pur pureus montanus. The purple mountaine Milke Vetch.

A.tera fugunus.

6. Aftragalus

8. Aftrageloides berbariorum. Bafe Milke Vetch.

9: Affragaloides Heloeija. Germane bale Milke Vetch

6. Aftragalus pur pures carulem Hilbingin

The Spaniard, faith Cluston, held another plan to be Afragalus which answered thereto in the facilities, be differing in the forme of the roote, it had many floor and hard hoarie stalkes growing neare the ground, with faul winged leaves like unto Cicers or Lentils, all hory lifewife, and of an astringent taste: the flowers stefmall, growing in thicke tufted heads, of a blewish purple colours the roote, faith Clufius is ufully but fingle, and no way agreeing with the roote of Astragalue.

7. Aftragalus purpureus mountanus. The purple mountaine milke Vetch.

This milke Vetch hath a great long wooddy roots, with fome fibres fet thereat, blackish without, and white within, from whence rife many hard stalkes, some lying

as it were upon the ground, and others flanding onight
about halfe a foote high, the winged leaves that grow thereon are many, finall and hoary, fill keeping an equal number, upon every foote stalke, somewhat resembling the Afragalus Syriacus but longer, the sulker arended or bare of leaves from the middle upward, faving a few, that under the tuft of flowers at the toppes are round, and are like unto other Pulles, of an excellent purple colour, and the feede follow in small code: it flowrethin May and Iune on the high hills of Sevena, but most plentifully neere a small towne called Merms in the grove of wood next unto it, in borto dei, and the hills neerest thereto about Mompelier : it is utterly without any share talte, and but onely a little faltish that can be felt.

8. Astragaloides s berbareorum. Base milke Vetch.

The base milke vetch riseth up with fundry upright hard crested stalkes, a yard high set on all sides with winged leaves foure or five couple against the middle ribbe, with an odde one at the end, of a very sad greene colour, no bigger than those of the Lentills: the flowers stand at the toppes of the stalkes and branches many set together which are small and short, of a dead purplish colour turning wanne with standing, and change into small blake cods almost round; but pointed, within which are foure or five small blackish seede; the roote growth great and thicke at the head, tough and wooddy, discending deepe, and abiding many yeares, but all the stakes prish every yeare, fresh riling in the Spring.

9. Aftragaloides Helvetic. Germane base milke Vetch.

The stender stalkes of this plant, that beare many Pease blossom'd flowers at the toppes of them, are not made above three inches high without any leaves upon them; the leaves themselves standing singly upon long some stalkes, being somewhat long, broad, and round pointed, as the sigure doth plainely delineate forth. The Place and Time.

None of these grow wilde in our Land, that ever I could understand, but are nursed up with those that are curious lover of rare plants : they flower in ?wly, and their feede is ripe in August or September.

The Names. It is called de einal in Greeke, and Afragalus in Latine: the first is called by Clustur Afragalus Besicus, and by Lobel and others Afragalus Lusicus Clusis, by Bellus that sent it out of Candy to Clusius, as it is set downers. his fift Epiftle Phaseoli novam genus, as Clufius in his Scolea under it thinketh, which I can not fully evince not he ving seene either of them (if they be divers as I thinke they be)growing that Bellus there relateth that the seed was flat like unto a Kidney Beane, and that the Marriners did eate them while they were greene; and class with of his that the code are long, and the feede round within them, burning and enflaming the mouth, for which one it is probable that Amatus Lusuanns called it Apocynum: & the Spaniards Atramoso de can, as being fit to hall dogs, fo that these contrarieties doe rather argue them to be divers plants: the second was brought me out of Spaniary by the page. Bool, by the name expressed in the title, but came to us also from Leyden by the name of Astragalas marines. Panni, either because Pannins the President of the Garden there had it from Boel, or from Spains, where bell

9. Seffan Gve Still does Egyptiaca artitulara. Hatchet Vetch of Egypt with long jeyneed cods.

stender stalkes, and many long stalkes of winged leaves like unto a Securidaca, yet each of them somewhat los ger and narrower : the flowers come forth from the bosome of the stalkes and leaves many closlering together in a long spike of a deepe yellow colour, and succeeded by long joynted cods, conteining many Fennegiciolite seedes therein: the roote spreadeth well under ground, and abides many yeares. This is that Plant which Cissus on pared his Anil unto, or rather was mistaken, the title Anil being imposed for Session assured by the fight of the true seede of Anil received from the East Indies to like unto Fennugrick feede and the growing there. of fo like unto this Seffan with many winged leaves, compared by Camerarus unto those of Barba four fines, and to those of Sena by Mr. Finch, as it is before set downe where I spake of Indice, which is Willor Anil of the Arabians, this Selban being either a frecies of that Nil Anil or Indice, or that a frecies of this.

10. Hedy/arum tryphyllum Americanum. Americas Trefoile Hatchet Vetch This kinde of Vetch groweth higher in shadowy then in sunny places, with many stalkes a soote or two high. and leaves fet thereon three usually at a place, which are larger then those of Trifolium bitaminosum and of a reddiffigreene colour: at the toppes frand the flowers in a long spike, like, but much larger then the flowers of the ordinary Hatchet Vetch, whose uppermost leaves are much redder then the edges and ridges which are paleted. after which come rough crooked pods with reddiff veines both above and below. fet as it were with joyns, having small seede within them like those of Broome : the roote is a bush of blackish threads or sibres, this hathno fent to commend it, and dyeth downe every Winter rifing anew in the Spring the take of the green plant is not so easily perceived to bee hot and dry in the first degree as it is in the dry, having a little purging qualitie therein: for if an ounce of the dryed leaves bee put into a purging decoction it furthereth the purging properie, cauling not onely thinne and whayilb humors to be avoided, but those that are tough and clammy allo: it do much helpe likewise to digest cold humors.

The Place and Time. None of these doe grow naturally but onely in curious Gardens with us, yet the third and fourth had need to be fet in some our corner where their running rootes may doe no injury to better herbes, and sower and seeds in Inly and August.

The Names. It is called in Gracke i fromes Hedyfarum, and mainre pelecinum as Dieferider faith, and in Luine Securidad for mixture fignifieth/search and from theme the name role, Turnebus thinketh it should rather be read Search late. The first is generally of all writers held to be the true Hedysarum of Disserides, for in his time there were no more known and Cluster Gibb death. no more knowne, and Glussen saith that hee saw Hatchets at Madrill in Spaine made after the fashion of those cods, that is, thick in the middle where the handle was put in, and thin at both edges: the fecond also is of all called Hedylarum minus, or Securidaca miner, yet Clases was put in, and that at both enges; the second at the figure hered

TRIBE II. forbit, and calleth it Afrayalm Monipellianus : the third Clufton referreth to the greater kind, yet differing in the forbis, and cantern records and because it is greater then the fourth I have given it the title of greater, it former hat refishing of the course, and the following of Dodonaus, Camerarias calleth it Hedysaram Scorpinrum, and as Bauhinnes fealeth the greates and annucly unlike the Lorus enneaphyllos of Datechampius; the fourth Chaftus faith hee had from Dr. this tent is not a four London Colledge, who gathered it neare unto Geneva and imparted it to him, thinking it log application of Dieforides, Banhinu nameth it Securidaca dumetorum minor politic erulea, when as the theory of Dieforides, Banhinu nameth it Securidaca dumetorum minor politic erulea, when as whetherms assume the fift Clusses forth having received it from Gorins by the name of solver is blish and not blew: the fift Clusses forth having received it from Gorins by the name of solvering learnings. Hedglaram pergrinum which last title hee kept as fittelt, and I have perfited the soluptions, requirements, requirements of the second secon den, I had then beene more currous to have taken the descriptions of a number of Plants, which have perished with me and now I want: the first is called Hedylarum minimum by Lugdunensis: the seventh is mentioned by Apartis de exoricis: the eighth and ninth by him lib. de plantis Egypti: the last is mentioned by Cornutus anne of Canada plates by the name here expressed, onely the eighth and minth I have rather referred to the same the cother gate as Baubinus doth, although I acknowledge that not they onely but divers others others here let downs, and entituled Hedylarum or Securidaea have little conformitie in their pod or feede unto of the state of Hatches but more unto a Vetch. It is called in English Hatchet Vetch, Axe seede and Axewort. The Vertues.

All be forts of Heayfare especially the feedes are bitter, and thereby as Diofeorides faith of the true or first for the profitable to the ftomacke, and is put into those medicines that expell poylon or venome, and pursubstitutions of the intralland fo doe the leaves and falkes of the greene herbe, Matthiolus faith the conscipent form helps the biring of venemous creatures, and that they helps to expectorate both tough and codes being dates with a little hony or new wine; and opened the obstructions of the Liver and Spleene being dates with a little hony or new wine; and opened the obstructions of the Liver and Spleene being dates with a little hikewife the wormes in the belly if it be in en with fome (weete lye, or in with with a little Saffront put thereto: the meale of them clenfeth foule Vicers, and taketh away freckles, spots addelike markes in the skinne. if the faid meale bee made up into an ointment with the best hony and often amounted. Alpinus faith that the feedes of Sopher's or the eight were accounted poylonous to men and that the free of the Selban or ninth were used by the Egyptians to thrength n and dry up the over moisture of the stomade, sealfo to binde any laske and womens immoderate courfes: the Egyptians hee faith doe plant hedges brewith to defend their grounds.

CHAP. XXII.

Ferrum equinum. Horse shooe Vetch.

Here are a few small plants that some have referred to those in the foregoing Chapter but for their formes sake being different, I thought good to sever them and set them by themselves. 1. Ferrum equinum majus. The greater Horseshooe Vetch.

The greater Horse shoot Vetch hath divers fmall winged leaves fet on fmall weake stalkes not a foothigh, leaning or rather lying on the ground, each latebeing a little long and almost round at the end, and of whitish greene colour :at the joynts with the leaves come forth flowers fingle, that is one at a place on every hortfootflaike, being small and yellow, after which followeth a long flat cod a little bowed but parted at the imer edge into foure; five or fix divisions, each being or informed, somewhat like the Letter C. or as it tooke mename formed like an Horse shooe, wherein lye so many feedes as there are spaces betweene the cuts or diviions, which are fmall, formewhat long and crooked: the room is flender, three or foure inches long, white and hard, and liveth divers yeares.

2. Ferrum equinum minus.

The smaller Horse shooe Fetch. Thisother is in all things like the former, but leffer by the halfe, the stalkes being not above three or foure indeslong and lying close upon the ground, and is a little where then the laft.

3. Ferrum equinum polyceraton.
Many codded Horse shooe Vetch.

This also different little in the growing from the last, ting almost as small, but herein chiefely consisteth the lowers and fo many cods also together upon a long take rising from the joynts, which are a little browner then the former.

4. Ferrum equinum como (um. Bush headed Horse shooe Vetch. The build headed Horse shooe Vetch groweth as great as the

1. Ferram equinum majus. The greater Hotse shooe Vetch.

first both in stalkes and leaves, and full of branches a from the toppes of the stalkes and branches onely, and not from the joynts with the leaves as in the former, come long naked stalkes almost haife a foote long, bearing and hanging downe about their toppes a bush of flowers, of a yellowish greene at the first & of a deeper yellow colour after, with fome greene veines in them after they are palt there follow fuch crooked and mouned code as the other. but not very deepely cut in, wherein lye feedes like the other, the roote hereof is somewhat blackish but as hard and great as the first.

5. Ferrum equinum Gallicum. The French Horse shooe Vetch.

This hath a fmall short blacke thready roote and divers weake stalkes lying on the ground, with nine leaves with ally fet together on a footbalke : the flowers are vellow many growing at the head, which give small seede in fmall crooked hornes.

The Place and Time.

The first and second are naturall to our owne Land, being often found upon dry heaths as beyond Desford and Swanes combe in Kent and fundry other places, the other three in Italy, France, dre. flowring in Inne and feeding in July and August.

The Names.

It hath no Greeke author to speake for it, but being of later invention it is generally called Ferrum equinum, after the manner or forme of the cods, in Italian Sferre cavalle, and of the Chimicks there and in Germany, Lanaria filiquata, Matthiolus calleth the first Securidaca montana as Well as Ferrum equinum, Gefuer in bortis tooke it to be a kinde of Medica. Lugdunensis calleth it Solea equina

. Ornithepodium majus. The greater Birds fore.

and Tabermontanus Hedyfarum feve Ferrum equinum : the second as a lesser fort thereof hath his name is his title, Fabus Columna calleth the third Ferrum equinum polycer aten, and the fourth Ferrum equinum Canofam of Capatann, which Baubinus calleth Germanicum saliquis in summitate: the last Baubinus calleth Ferrum equinum saliquis in summitate: cum, and as he faith is the Lotus enneaphyllos of Dalechampius, differing but in the smallnesse from the Germaican of Camerarius. The Vertues.

It is wholly bitter as the Hatchet Vetch is, and therefore somewhat partaketh of the properties thereof: it is also used by some in wound drinkes, and the juice thereof to make salves for wounds.

CHAP. XXIII. Ornithopodium. Birdes foote.

Here are two or three forts of imall herberalled Birds foote, unto which I thinke fe to idjoyne fome other small plants comming res-rest to the former if not the nature of themin this Chapter together.

I. Orinthopodium mojus. The greater Birds foot.
This small herbe (although it bes greater then thenen) groweth not above a spanne high, with many bras-

> 2. Orwithenedium minus The leffer Birds foote.

ches spread on the ground, fet withmsny winges of imil icaves, in manner as the last Vetches but much finaller, the flowers grow upon the branches, many fmall ones of a pale yellow colour, being fet at a head together, which after turne into fo many famil jointed cods, Well refer bling the clawer of a fmall Bird, and from thence took the name, with many fmall cound feeds in them.

The Theater of Plants.

z. Orluthopedium minus. The leffer Birds foote. This in all things like the former, but leffe, growing with the branches and leaves in a more comely manner. and this maketh the difference. 2. Orinthopodium nodosa radi ce. Knotted Birds foote.

Thursday groweth in all things like the first, but a little larger, the flowers are of a pale whitish red colour. This office and the rootes doe carry many small white knon or kernells among the fibres.

The Place and Time.

Thelegrow on Heathes and open untilled places in many places of our Land; and flower and feede in the

The Names.
They have their names of Ornishopedium Pes avis, according to the forme of their small cods; being like unto Thy naveurs: name of the first one growth greater than the other, they are made two forts: the following first certain the other, they are made two forts: the mid Lugdanenfir calleth Orinthopodium tuberofum Dalechampij, and some, as he saith, Herniaria from the Pro-The Vertues.

The Birds feete have a little drying and binding qualitie in them, and thereby good to be used in wound driber, as also to apply outwardly for the same purpose; but the last, as Lugdanensis saith, is found by daily exprime to breake the stones in the backe or kidneyes, and drive them forth, if the decoction thereof be taken : addutit wonderfully helpeth the rupture, to be used both inwardly and outwardly to the place.

Plante Leguminofe alia parve. Some other small Pulses.

dere are yet a few other Pulse-like Plants, which can not well be referred to any other kinde of plant, and therefore thinke fit to fet them promiscuously in a Chapter together, leaving every one to their owne judgement, unto what genus they will referre them.

I. Antiplied legiminos wiles grans. The ordinary Kidney Vetch.

This small plant which groweth scarie a foote high, bath many leaves comming from the roote, that are formewhat small and long, fost pointed and sappy, greene on the upperfide, and woolly underneath,

1. Anthyllis leguminofa valgaris. The Ordinary Kidney Vetch.

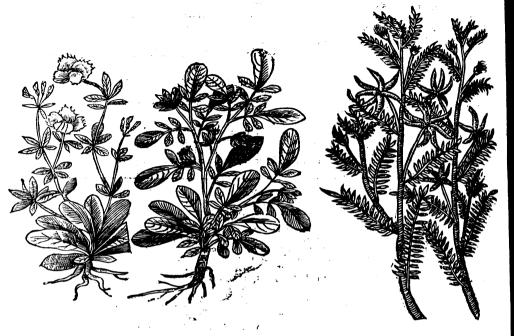

2. Anthyllis leguminofa marina, Betica five aprienta muris Camerarij. Sea Kidney Vetch of Spaine or Gandy.

4. 3. Anthylis leguminofa falcata Cretica, & Vefataria Hispanica. Crocked Kidney Verch of (andy), and the bladder Peale or Kidney Vetch of Spaine.

7. Stella le gamino/a.
The Starre codded Pulle or Birds foote.

not alwayes set orderly just one against another, but consusedly, the greatest and longest being at theend which fome have compared to Lentills leaves, but higger, (which coparison pleaseth me as little as the title of Authil) among the leaves rife foft stalkes divided into branches, with the like leaves on them, & at the tops of them and of many imali yellowith pretty fweete flowers, and iometimes white or pale purple, which Clafin faithle meived from Alphonfus Pancius of Ferrara formed like those of the meddow Trefoile, standing in whitehousy husbs: after the flowers are past come in the faid huskes small round and a little flatfleede, very like to the medow Trefoile, but a little redder, and unually but one in a cod within that huske : the roote is blackish on the outside and white within parted many times into two or three, or morelong parts.

2. Anthyllis leguminaso marina Batica vel Cretica sive Auricula muris Camerarij.

Sea kidney Vetch of Spaine or Candy.

Having well confidered this small plant, whose seed Bool brought me out of Spaine, and called it Ambylis Baixa marina spinosis siliquis: I find it so neere to agree to that which Camerarius called Auricula muris semine & lapin foliorum figura, that I dare fay it is the fame : for the leaves are very like the former Anthyllis both for fite and forme, but a little hoary or woolly, and yellow flowers, within a flat round huske, a little prickly about the edges, with kidney like feede within them a the roote is anuall as it is likely, for it perished yearely with me. 3. Anthylis leguminosa vesicaria Hispanica. Bladder Rease or Kidney Vetch of Spaine.

This small plant groweth low and leaning downe to the ground, with a few leaves next to it, which doe some times consist but of three leaves, but usually of five, the lowest whereof are smaller than the end lease that is largelt, and is tomewhat broad, and round pointed, and a little hable withall : on the stalkes grow the likeleave, and at the joynts with them come forth three or foure somewhat hairy fost swelling huskes, and at the topper of them whitish flowers scarse appearing, which being past, the scade growth in those huskes that then are more fwollen and sceme like bladders, wherein usurlly are cantained two small round pease like to those of Orden: the roote is long, flender, and annuall. Camerarius in borto calleth it Trefelium Halnacabum, but faith it is rather a Lotus : Profer Alpinus in his Booke De Plantie exorticie, calleth it Trifolium vesicarium; but Bul from whom I had it Anthyllis Betica veficaria.

4. Anthyllis falcata Cresica. Crooked Kidney Vetch of Candy. This Kidney Vetch of Candy hath fundry leaves spread upon the ground, every one wherof is very like the longeft or end leafe of the laft, from among which rife up the stalkes, befer at the joynts with lesser leaves, sometimes but two at a place, otherwhiles three, foure, or five, finanding force places close together, refembling the Treole or Cinquefoile leafe, without any footestalke to them; and fome also will have the leaves separate on bubbles of the faller on the first of the faller on the footest of the faller on the footest of the faller on the faller of the stalke, one above and against the other; the flowers stand three or foure together at the tops of a yellow colour, like those of the horned Claver, after which come crooked cods of a skinny substance with small seeds

6. Gisax Hiffanica Clufij. Clofins his Spanifle Milkewort.

7. Scorpioides leguminofa. The Scorpion-like Polle.

winn them: the roote confisteth of small strings and fibres: Alpinus calleth it Trifolium falcatum, but because I water them: the roote commetent of agree in face with Antophia, have therefore put them together, fade both this and the last better to agree in face with Antophia, have therefore put them together, s. Stella Leguminosa. The starre codded Pulle or Birds foote.

This starre sashioned Pulse groweth also about halfe a foote high with upright stakes, whereon are many wing deaves set, consisting of very small leaves like unto the Birds soote, from the joynts of the stakes with the leaves come a tust of small pale yellow slowers at the toppes of small prickly fading stakes, which tune into five or fixe small, long, crooked, pointed cods, standing one against another, like unto a starre, from whence to fe the name, but not joyn:ed as the Birds foote, having within them small brownish seede, of the taste with the results out not form and it the roote is small and yellowish.

6 other Pulse, but a little clammy with all: the roote is small and yellowish.

6. Glanz Hispanica Clusij. Clusius his Spaniss Milkewort.

The Spanife Milkewort of Clusius rifeth up with three or foure hoary weake stalkes not a foote high, whereon gow many soft leaves, made of many small ones set together on both sides of a middle rib, like as those other Pulinheretefore, of a greene colour above, and hoary white underneath, and a little bitter in tafte: the stalkes are but towards the toppes, where they beare a short spike of flowers set close together, each rising out of a hoary baske, and are of a pale blewish purple colour, after which come short round pods, with 4. or 5. small round kedes within them; the roote is small and threddy.

7. Scorpieides Legaminosa. The Scorpion like Pulse.
This also is a small Pulse with winged leaves like the last, but rounder: the flowers also are small and yellow, finding on long naked stalkes, one or two together, which curne into long and flat joynted cods, ending in a mall long crooked point, formewhat like a Scorpions taile : forme have taken it to be a Securidaca. The Place and Time.

The first is found in many places in this Land, and so is the fift, if I be not much deceived; the rest are strangers, this titles declaring it in most: they flower towards the end of Summer, and seede also. The Names.

The Plants have not beene knowne to any of the ancient Greeke or Latine Authors that we know. The first is divelly named by diverse of our moderne Writers: Podoneus calleth it Anthyllis prior, and Anthylis Lately Classus, by Tabermontanus Lagopodium, by Thalius Arthetica Ixaum, by Gesner is hortis Vulueraria rustica because his Country husbandmen called it Wundkraut or Klein "and trant; and those of Berne Guichheil, and Bauhinus Lote affinis Undneraria pratentis: the second Camerarius, al faid, cal'ed Auricula muris, and Boel that brought it us, as it is in the title, and io likewise the third, which Camerarius, as I faid, although hee called it Trifolium Halicacabum, as Alpinus did Trifolium vesicarum; Jujudged it rather a Lorns : the fourth is onely mentioned by Alpinus, lib de exoticit, by the title of Trifolium distant Creticum which with the former I have rather thought fit to referre hither: the fift is called by Lobel Stille leguminosa, and as Baubinus thinketh the Vicia Sesamacea of Columna: but in much miltaken therein, as I bewed you before in the Chapter of Aftragalus: the fixt is called by Clufius Glanz Hispanica, and thinketh that no others so called, came so neare that of Dioscorides as this : it is very likely to be the Glanx maritima of Alpinus, the exticue; Dodonem calleth it Anthylin altera lentismilis; Baubinus maketh it to be the Cicer sylvestre minus o'Thelins or very like it: the seventh is called by Lobel Scorpioides legumino(a; but both this and the Stella leguming are referred by Bankinus to the Orinthopodia, calling them Orinthopodia affines: Bankinus among the Polyfonthopodia affines to the Orinthopodia affines and the Stella leguming are referred by Bankinus to the Orinthopodia, calling them Orinthopodia affines: Bankinus among the Polyfonthopodia affines and Indian Prima Clussis, which he sauth hat leaves like Lentills, but fatter, a yellow flower and feede in pods, which I thinke more likely to be this Scor-The links than any kinde of Polygala.

TEIBEII.

The Vertues.

The first is of much use among the Germans for their wounds and hurts, inward and outward, and so their so shows the same imposed them. The first is of much use among the vermons for their would also sheweth by his name imposed thereon, their wayes apply them, whence came their name: Thalins also sheweth by his name imposed thereon, their

CHAP. XXV.

Fann Gracum, Fenugreeke.

He ancient Writers made but one fort of Fenugreeke, the latter have added some other many and although some have set them among the Trefoiles, whereunto they are somewhat like, yether and although some have ter them among the Assembly, was anothe Egyptians and others say, that they were eaten as Lupines, and the Egyptians and other says that they were eaten as Lupines, the Egyptians and other saids caule Gaten and others tay sunt trey water and that Banbinus thereupon, as I guesse place being feedes yet to this day as Pulse or meate, and that Banbinus thereupon, as I guesse place being mong the Pulfe, I am content to doe so likewife. 1. Fanum Gracum fativum. Manured Fennerecke.

The tame Fenugreeke rifeth up sometimes but with one 38 sometimes with two or three hollow green but. The tame Fenugreeke ritering iometimes out with one-se tometimes, but three always fetrogene a parted into divers branches, whereon grow at feverall spaces, many leaves, but three always fetrogene a foote stalke, almost round at the ends, & a little dented about the sides greene above, and grayish undergenere the joynts with the leaves come forth white flowers, and after them crooked flattifb long hornes, fmiling with yellowish cornered seedes within them, smelling somewhat strong and loathsome; the roote is noted many fibres perishing still before Winter. 2. Fanumgracum fylveftre. Wild Fenugreeke.

This wilde Fenugreeke hath the like one or more stalkes branched, the leaves stand three togethe, and see fome what like the former, dented about the edges, the flowers likewife are whitish, but fland more together the end, and to doe the long cods, fomewhat like unto them, with smaller and darker seede in them. 2. Fænumgrecum alium sylvestre. Another wilde Fenugreeke.

This other Fenugreeke hath but one stender stalke, seldome branched, of a foote high, and salvasit week the bottome, whereon grow fuch tike leaves as the former, and at the joynts flowers like unto the manurel flow ding fingle and leffer, but broader hornes afterwards, more flat, and ending in a small thread, the feede within is likewife leffe.

The Place and Time Thefirst is manured every where that I can heare of the others grow wilde in Spaine and other countries the flower with us in the beginning of Iuly, and give their feede in the end of August and September.

> 1. Fanum gracum fativum. Mamured Fenugreeke.

2. Fanum Gracum fylveftre. Wilde Fenu recke.

The Names.

Ringled in Greeke by Dioscorides mais, and by other Greekes whomas and a somers, but Theophraftus calleth it It is sted in torcease and ine five fit capri vel brown, the crooked feede veffells being so like unto hornes; in Latine to the capre to that, as Columna saith, it had two times of sowing, the one before Winter to be fodder familiarin, because that, as a communication is not the control of the control of the control of facede, and fimply calleth it Sitema. Dervo calleth it Sitema; and Pliny Signature of the control of the lating Fausings commission of Lugdings of an entire the Heavy arm minimum of Lugdings of the Stations of the Germanes Bocksthe Italians call it Olba Hebes, and Helbes, the Italians Fiengreeco; the Spaniards Afforda; the Germanes Bocksthe Archiens call it Own and English, Fenngreeke.

The select Fenugreeke is onely in use with us, the herbe it felle never used that I know, because it is seldome Interest in the first, it is powder of the feede taken with a little hony driveth forth many noylone. humors and the body, mollifieth inward Impollums and Vicers in the Lungs and breaks, and eafeth the griping paines in the lings and breaks, and eafeth the griping paines in the lings, but it dots overturne and breede a loathing in lome from ackes, especially if they bee tender, but will have to robultious and countrey people invied to firing labour, for I know no Phylitions in our dayes be well inwardly, yet Alpines faith that the Egyptian women doe use to eate the seed, which Galen and divers the seed in their times (being buried a little in earth to make them sproute, whereof many Sacke fulls and the markets daily) to make them grow fat. But outwardly applyed it hath many good uses of familia addily experience, for the meale thereof heated with Vinegar and applyed outwardly to the Region of the Space, doth mollifie and waste the hardnesse thereof, as also other hard tumors and swellings; the decoction mollifieth likewise the hardnesse, and other paines or heate of the mother, and openeth the obstructions disjithey fit therein as in a bathe, or receive the hot fumes by fitting over it: the decoction thereof clenfeth the band haire from fourfe, dandraffe and the running fores thereof eit helpeth the difeale called tenafmu, minan often defire to the stoole without doing any thing, as also the Bloody flux when the excrements small small with the meale thereof and Linseede, and the decoction of Mallowes, and a little cyle or danger put thereto affwageth the fwelling and paines of the cods or privy parts of women, and generally all Annua pur mercio aniwagern the inventing and paines or the code or privy parts or women, and generally all observed in the fauncial observed in th the fedual in the Stone by opening and molifying the inward parts. Lebel faith, that of the feede is made an opening evertue then would be believed, to dissolve scirrhous swellings in the intralls, and other hard knots

CHAP. XXVI.

Tribulus terrestris. Land Caltrops.

He Land Caltrops (for that of the water shall bee spoken of in another Classis or Tribe) riseth up with divers small hard branches, with divers winged leaves on them made of many small leaves fet on bublides of a middle ribbe like Orobut: at the joynts had healy finall pale whitifu yellow flowers which tune int. imail rough prickly heads, of five or fix corun, wherein lyeth a finall kernell or feede : the roote powehdownewards with many long fibres thereat. The Place and Time

herbes.&c.

herbes, &c. and Virgil feemeth to expresse the same of Pliny in these verses," Lappaque Tribulique, niterque intentia culta, Infalix Lolium, et steriles dominantur Avene,

For the Corne was no way otherwise hindered or spoyled, then as other Weedes would doe by their plants For the Corne was no way otherwise minures or approximate a nourishment from the earth that feel the growing, to hinder the growth of the Corne, in fucking away the nourishment from the earth when the carth when the growing, to hinder the growth of the Corne, in lucking away the nounting the carth wherein the four but by tearing the Legs of the Reapers; which faults or plagues role from the earth wherein the four of the but by tearing the Legs of the Keapers; which rather the Legs of the lay hid, ready upon occasion to spring and not in the Corne, which if it were sowen in a ground many that weeded Garden cleare of fuch weedes, would have none of them among it. The Vertues.

The Land Caltrops are of an earthly cold qualitie and thereby aftringent and hindering the breeding of them. The Land Caltrops are of an earthly cold qualitie and thereby an arrangement of this parts it do man before marions and Impoltumes, and against the flux of humors of moreover being of this parts it do man before here and waste the Scone in the Kidneyes of Lotion made therewith healeth all fores and Victoria in the man. breake and watte the score in the Montyes . a Louisi man the juice doth clenfe the inflammation and all corruptions that breede in the gummes and throate a the juice doth clenfe the inflammations and obligate. and all corruptions that breede in the gummes and throate; the juice dother and all corruptions if a dram thereoberate in wine. The Thracians faith Pling and Galen that dwell neare the River Strimen did feele their Hofe with the greene herbe, and lived themselves of the fruit or kernells, making them into a sweete bread whichband the belly; Pliny addeth that the roote being gathered by a caste persons doth consume Nodes and Kendhitte feede bound to the swollen veines in the Legs, or other parts of the body taketh the swellings away, wholes the paines.

CHAP. XXVII.

Glaux leguminofa five Glyenrhiza fylvefiris. Licoris Vetch.

F this kinde of wild Licoris we have two or three forts to fee forth unto you, and unto the lad adjoyne the other two forts of manured Licoris, which some good authors have likewife refused among the Pulses as I doe here.

I. Glaux while are leguminofa. The most common Licoris Vetch,
This kind of Licoris Vetch lenderh forth many weake round hard stalkes trayling on the goals. branched upwards, fer somewhat thicke with wingett leaves made of many, fer on both fides a middle ribe fomewhat like as the Verch hath, but much larger and pointed : the flowers come forth at the joynts, at the mid a long stalke many together, of a bleake white colour tending to yellow, which turne into trooked con.

1. Glanz vulgaris leguminofa. The most common Licoris Vetch. 3. 4. Glycyrrbiza vulgarie filiquofa & cchines.
Codded and rough headed Licoru.

TRIBE II. this two rowes of feedo-cornered and grayith, of the tafte of other Pulies: the roote is thicke and long, division to the puller of three long firings running very deepe into the ground Greete in a division to the ground Greete in the groun thing two rower or three long strings running very deepe into the ground, sweete in taste like unto Licoris, the same the same should be same the s ding felfe into two of time. The spring forth new branches every yeare in the Spring, which dyeth not but abideth long, shooting forth new branches every yeare in the Spring, which dyeth not but abideth long. Glaux altera leguminofa. Another Licoris Vetch.

This other wilde Licoris hath fuch like stalkes and leaves as the former, but not spreading so farre, nor leaning This other where the winged leaves also are nor to large, of a darker greene on the upper fide, and gray underdowns to much, the war great purplish colours, the cods are brownish long and round, and the feede within them gets, the fowers is like the world does and Greating and an firm and the feede within them puts, the nowers are on a pure the former growing deepe and spreading, and as sweete as the other. Thalise por round: the roote is like the former growing deepe and spreading, and as sweete as the other. Thalise sin that this is very like true Licoris except in some few things.

in that this is very like true Licotis except in tome rew things.

3. Glyppible valgario fliquata. Common Licotis.

14. The many round wooddy flakes, fet at feverall diffances with many winged leaves, made the state with many round wooddy stalkes, set at severall distances with many winged leaves, made is sin small long ones tet on both sides of a middle ribbe, very well resembling a young Ast rise from the state in the sound of the state of of dependent and likewife fuckers from the fides, whereby it will quickly encrease, browne without, and yellow within of a fweete talte. 4. Glycyrrhiza echinata. Rough headed Licoris.

This other Licoris groweth in the same manner that the former doth, with the like leaves and flowers, but of alent blew colour, and growing for the most part at the toppes of the branches, which are followed by rough home heads, like to the burres of the Planama Plane tree, as Diofeorides compareth them, being many rough mousike those of Lentills, feet together in a bunch, with one browne flat seede in every cod: the roote growthe deepe as the other, but brancheth not under ground like it, and is of a stronger or more bitterish sweete The Place and Time.

The fift groweth in many places about Cambridge, in Claringdon Parke by Salisbury, and Thrapstone in North-Langua Bire and many other places of our Land, the other I have not heard hath beene yet found with us, but in Group, &c. The first fort of Licoris is faid to grow chiefely in Germany about Novemberg, the other in France. Spin, Italy &cc. and flower with us late, and feede as late, if at all. Camden in his Britania faith, that Licoris growth wilde at Worley in Nottingham fhire, but I beleeve he was mistaken therein, for that they of that countrey plus great store in their fields, and thereof make good prosit, as we doe in many other places in Gardens.

7 be Names.

The first is called Glicyrrhiza filvestrie by Gefner in hort is by Camerarius, and by Lugdunensis, Polygalomby Corbum Dieferides, and in his Hittorie Polygalon Cords by Thalins, Glanz, and Glanz unlgaris by Lobel and Cluful, Fannmerecum filvestre by Tragus and Dodonaus & Hedylarum glycyrrhizatum by Gerard, and many Herbanil, sanamerecumi societe by 2 section for the lateo pallescentibus: the second is the Glycyrrhiza streeting of Thelim, and alia of Camerarius in horto, by Lobel Glauca vel Glaux quadam leguminosa herbariorum, & by Bauhinus. Cheprebita filveftris altera floribus puniceis foliss Arachi: the third is called Glycyrrhiza Germanica by fome, & Le-18, or non Echinata by others, and filiques a by Lobel and others, Dulcin radi : by Tragus and Cordus, and Liquestia. in the Apothecaries shops : the last is called Glycyrrhiza echinata Dioscoridis by Lobel and Lugdunensis : Glyspring Italica by Gefner and Dodonaus, and simply Glycyrrhiza by Matthiolus and others; Theophrastus calleth in Horsa Scribica; the Greekes yauxuppi Ca and fo the Latines Glycyrrbiza, that is, dulcis radix, and of some Chyprhicen: of the Arabians Sus, of the Italians Regolitia, of the Spaniards Rogoliza, of the French Recliffe, and Righlife, of the Germanes Suffoliz, of the Dutch Suethout ; and we in English Licoris. The Vertues.

The two forts of wilde Licoris are not knowne to be used in Physicke by any, but are wholly neglected : for the other two forts of true Licoris, their properties being both alike, I shall not neede to entreate distinctly as if the one had some other faculties that the other had not, for they are therein both alike, and as Galen saith, is very familiatto our temperature in that it is sweete, and having a little astriction joyned with it, making it tempeneinheate and altriction, that it is the nearest unto our temper, and by both these qualities, as he saith, it doth saise the hoarsenesses, the hoarsenesses, and is helpefull for the phees in the bladder; it hath also some moisture three by reason of the sweetnesses, and thereby good to quench the thirst: Licoris is often boyled in faire wato, with some Maidenhaire and Figges, which maketh a good prifting drinke, for those that have any dry cough, and to digett the flegme, and to expectorate it, or hoarsenesse, wheeling, and shortnesse of breath, and all other grid of the break and lungs, the tifficke or confumptions caused by the distillations of falt humous on them, which doe waste and consume them : it is good also in all the paines of the raines, the strangury, and heate of wine. The Scythians are faid by chewing this in their mouthes, that it keepeth them from thirst in their long jourmuthrough the defarts for tenne or twelve dayes, and staieth hunger also: Licorisboiled in water, with a little Common added to it, serveth in stead of drinke in many places, especially if it be set to worke with barme as berre is, and then tunned up, and will grow cleere, strong, and heady by time as beare will doe: the sine powder of Licoris blowne through a quill into the eyes that have a pinne and webbe, as they call it, or rheumaticke di-fillations into them, doth clenfe them and helpe them: the juyce of Licoris is as effectuall in all the di-fillation into them, doth clenfe them and helpe them: the juyce diffolved in Rotewater with one Gamme Tragacanth, is a fine lohoc of licking medicine for hearfenesse, wheelings, and all other roughasse in the mouth orthroat, and to expectorate tough slegme, as also to condensate thinne rheumes, falling on the hop; our English Licoris is more pleasant to the talte, wanting much of that affriction is in that which commeth to us from beyond fea.

The Galega or Goates Rue should have taken up his place here, as being proper to this Classis, but as you may sebefore, I have drawne it and others into another Classia, for the reasons there specified. There yet remaines a maker of Trefoiles to be spoken of, as being nearest to the Pulses, especially those that are peoperly called Lorne

filiquosi; because their long cods are more eminent to be seene, which shall next follow, and the set

CHAP. XXVIII.

1. Lotus edulis Creticus. Trefoile Peafe of Candy.

his Trefoile Fulfe or Peafe shooteth forth divers stender stalkes fer with brownish greene leaves at 6 this I retoile fulle or Peale incoretti forth divers hender transcence want of which are fappy, a little thickend y verall diffances thereon; three alwayes franding on a foote stalke, which are fappy, a little thickend pointed, the flowers are yellow, but like unto small Peale followed, which are followed by road pointed, the nowers are yenow, our time times the finallnesse of the plant, wherein he ros Peafe of a sweete taste, like unto our ordinary Pease, and while they are young and greene usually fold in their Peate of a tweete tatte. like unto our ordinary reale, and white they are young and greene until 10th in their markets, and as much defined of them, as our Peafe with us: the whole Plant with falkes and leaves are little hairy: the roote is finall, thready and annuall growing among their corne, and in the borders of their field.

2. Losus quadripinnatu (liquis. Square codded Peafe.

This kinde of Pulle or Peafe I have shewed you in my former booke, that it hath a crimion blossome, and long round cods, with four e simes, two at one side, and two at another.

ound cods, with four enimes, two at one noe, and two at another.

3. Arbus feu Lorus Apprica. The Egyptian four eleafed Lorus.

This small herbe growing not much above an hand breadth high, hath divers round Trefoile-like leaves growing on the hairy stalke foure most usual together, at the toppe whereof standeth sundry white slowers, after whom the seede followeth that is like unto Peare kernells in the huskes.

This wilde Trefoile rifeth up with stalkes a soote high, having at each joynt two small leaves, and from there This wilde I retoile riteth up with traines a roote ingu, naving at each joyne two main traves, and from there three other small darke greene leaves, upon very short or no foote stalkes at all; the flowers are small and relow, comming forth both at the joynts and toppes of the stalkes, usually two together, and so many codelike wife come up in their places, being very small, and long, with seede in them, as small as Mustard-seede: the roots is small and hard, yearely perishing, the whole plant tasteth somewhat like a Pulse, yet with a little bittetenand fourenesse therein which quickly vanish away.

5. Lotus prateus: Monspeliensium. Smooth codded Trefoile of Mompelier,

This rifeth up with cornered and jointed stalkes a foote high, with leaves, usually three together, more long than round; the flowers are yellow, growing both at the joynts and toppes of the stalker, sign which come large and long cods, with feedes like Fenigreeke in them: the roote is small andlong,

6. Lotus asperior fruticosus. Rough Trefoile of Mompelier.

This is like the last, but that the stalkes grow bigger, harder, and rougher, the leaves are narrower and hoary: the flowers are yellow fet in hoary huskes fmaller than the former, and the feede leffer alfo.

7. Lotus fruticofus Granatenfis.

Spanish hoary hard Trefoile.
This Trefoile found by Clusius in Granado & Valen. tia in Spaine, and referred by him to the Oxytryphyllum of Scribonius Largus riseth a cubite high, with many branches, and three leaves alwayes fet together, faith Clusius, (but sometimes foure saith Lobel, if his be the fame:) the flowers are small & whitish, many growing in a round tuft together, with small feede, after them contained in small long cods; the roote is somewhat great and thicke, and astringent. Of this he maketh two forts, one whose stalke is greene and the roote white, growing in moist places; the other with reddish stalkes and branches, and the roote somewhat reddish, wherewith, as he faith, they use in those places to make a syrope of good effect against the bloody

8. Lotus bamorrhoidalis major sive Trifolium hemorrhoidale majus. The greater Pile Trefoile.

The greater of these pile Trefoiles, hath a long straight roote, somewhat wooddy, with very few fibres at it, from whence rifeth up ufually but one falke a cubice or two high, branched into divers hard weake flexible twigges, and they againe into other small branches, bearing at every joynt five leaves, two whereof stand close to the stalke, each upon a small foote stalke. and the other three rife betweene them, and higher than they upon another foote stalke like a Trefoile, the leaves and stalkes being all hoary, yet in the young plants, onely the three leave stand together on a stalke

1. Lot m edulis Creticus. Trefoile Peale of Cands.

2. Lorus quadripinnasis filiquis. Square codd d P. af. Lorus filveltris Creticus, Candy wilde Trefoil... Abfus fen Lotus B: pptaka. The Egyptian four: 1 af d Lorus.

without the other two at the bottome of them, the flowers grow many together in a tuft, of a whitish red or the flowers grow many together in a tuft, of a whitish red or the flowers greater and thicker than the next that folbuth, of a blackish red colour, sowewhat swollen, and very well representing the hemorrhoidall veine, as it speareth. Swollen and fallen downe, from whence it in part tooke the name, and partly also from the singular Ropenie it hath to cure the piles, within which are divers small round blacke seede.

9. Trifolium hamorrhoidale alterum seve minus seu Lotus Dalechampij. The lesser pile Trefoile, This other lesser pile Trefoile hath a tall stalke, two or three foote high, parted into long branches, with tow forewhat large leaves both close fet to the foote of every branch, and to the joynts where the leaves grow and, from whence come other leaves, as large as the ordinary Trefoile leaves, three standing together upon a long

foote stalke : the flowers grow in tufts at the end of the branches of a light blush colour, which are followed by small round and shorter pods than the former, with such like seede in them: the roote is somewhat thicke and wooddy, full of ftrings, yet yearely dying with us, and hardly, but in a kind yeare giving ripe feede.

10. Lotus Corniculatus frutescens. Bush horned Trefoile.

This Trefolie hath small smooth and greene stalles a foote high or more, fpreading many thort branches, wich three leaves on their foote ftalkes, being long and very mirrow; the flowers are yellow that thoote forth at the topper two or three together, and fometimes more, after which come thicker and shorter cods than the next, ending in a lang point, wherein are contained small seeds 1 this is sound smertines to have broader cods, and ending in a thorter point, it groweth about Mempelier and in Italy also, and with mally in force

5. Lotus prateulis Monspelling

Lotus bamerrheidatis major five Trifolium hemorrhe The greater pile Trefoile.

TRIBE II. 6. Totus afferier fraticofus. Rough Trefoile of Mountier

Trifolium hemorrhaidale alterna minus five Latus Lybyca Dalah, The leffer pile Trefoile.

11. Low carriculatus minor pilofus. The leffer hairy horned Trefoile. moder hath stander stalkes) covered with very small reddish haires, the leaves likewise are hairy, small, Theoret many three on a foote stalke, and two at each joynt, from whence spring the flowers, one or a small stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like an haire, of a deepe valley, and the stalke like like an haire. puller pounds, sale like like an haire, of a deepe yellow, tending to a faffron colour, unto each whereof mathement of a lattron colour, unto each whereof forcemavery manufactures, when very manufacture therein : this life the fills adjacent, and as frequent with us.

12. Lorus Corniculatus incanus. Hoary horned Trefoile. This groweth low, but with a little larger leaves and flowers, of as deepe a faffrony yellow colour as the other, his growers a fast work of crimfon on them growing three or foure together and small long crookedcods folwater, with round feede in them : this is found also in divers medowes,

pring them with round rectue in them; this is round and in divers medowes.

13. Trifolium cornicularum Lustranicum flore rubro. Horned Trefoile of Portugall with red flowers.

Lagour. Hares foote.

He next fort of Trefoiles that are to bee handled is of these whose slowers grow in dos heads, called Lagons Hares foote, where of there are halfe a dozen.

He next tott of itetolars that are to be an all the a descent.

It is great Hares foote hath divers trefoile leaves rifing from a famil long thready and amount of the medow trefoile as well in the bignesse as forme, very lost, and of a pair green enjour, among the rient weake bending stalkes a foot high or more, branched and bearing the like but somewhat longer leaves on the and at their toppes close spiked heads, with many small showers round about them, each in a few control of an excellent crimson colour, in which hunters after the flowers are past grow small yellowish round seed, on onely in a huske, whose brims or corners then stand displayed somewhat like unto a starre.

The Leaves of this Hares stote are heary, large, and longer them the former; with divers conspicuous vision them making them show the middle ribbe on the backe of them being somewhat great also the slowers are like the former both in forme and colour, but the whole hand is longer.

This Hares foote bart lalges a foote high, see at Hares foote with very narrow leaves.

This Hares foote bart lalges a foote high, see that to gether, as the toppes where f gow slarge they are found to be larger, but fill long and narrow, three set together, as the toppes where f gow slarge they are found to be larger, but fill long and narrow, three set together, as the toppes where f gow slarge.

This Hares foore hath stallage a toote high, let with very narrow heave manor are grane, yet in some place they are found to be larger but still long and narrow, three set together, as the toppes whereof grow using a spiked head of flow ere as the first, but the colour of them are paler, and the ends or cornered toppe division of the huskes are hard and almost prickly if not wholly. Lugdamensis calleth this Alepsenrae Granning Delethary,

4. Legopus angustifed in Hispanicus. Spanish narrow leased Hares soote.

The Spanish Hares soote is one likewise of the greater kind, having a firm estraight stalke but sender, with the spanish stalke but sender, with the spanish that is the spanish that the spanish that is the spanish that the

The Spanish Hares tooks is one likewise of the greater than a long at in the transport takes our tensor, with the vers branches thereat, with three formewhat long, narrow and pointed hoary leaves, with great ribbs on the backes upon long fooastalkes fet at each joynt, which are somewhat broad at the bottome of them, compassing the state and branches with a little care thereat likewise, the flowers are of a pale red colour set in a log spiked head, but more loofe and not fo compact as the former: this I had by Beel out of Spains by the named Trunifolim.

> z. Lagopus maximus flore tubio. The greatest Hares foote.

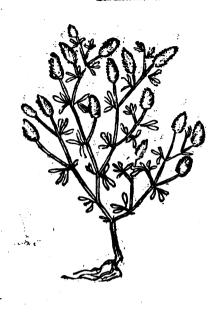

6. Legipus valgaris.

Legopus winer flore ruberrime. Bright red imall Hares foote?

This mail Harres foote bath small woolly or fost leaves as small but nothing so long or narrow as the last and punchind more then halfe a foote high, the spiked head is small but larger then the wide kind, and the souncementers are of a most excellent ersons one of the conters of whose woolly buskes stand out like statures where seed within them are ripe this is but annual pershing yearely as the former: this also came to me and spain by the name of Lagopus patens. The compon Harres foote.

The common Harres soote is well knowner to be a small plant growing greater and higher in some places and taken others, with whitish woolly small tressie leaves set upon the stakes, and many branches it hash, the white the composes are small and somewhat long with the roundnesses, composed as it were all of a hairy hoary sweet whose some of the same of a white in others of a blush colour it is annuall as the rest, and this is a special note of this family of thereas soote, or that bear of a blush colour it is annuall as the rest, and this is a special note of this family of the are to follow or that went before are not so : This also had from Boot, suppose take high, and another that shood hot upright, with many other forts out of Spains which are pershed with a strong that they persist a supposed.

CHAP. XXXI.

Trifolia capitulis stellatis globosis, &c. Starry headed, and round headed Trefoiles.

Hele forts of Trefoiles are likelt to the last in their heads chiefely, but they are not social compacted, but itand somewhat looser one flower from another.

1. 7 rifolium stellatum Monspelienfium. Starry headed Trefoile of Monnelier.

This Trefoile of Mompelier, hath a small white long & down-right root, with some fibrushers rashly taken it to be Trifolium cordatum) and a little dented about the edges from among which come three

rassily taken it to be Triplism cordaism) and a little dented about the edges, from among which come up the cord foure or more low stalkes seldome a spanne high or branched, but naked up to the toppe, where there sailly grow three such like leaves as the lower are, set under the head, which is a small round spike or smell, with many long slowers appearing, of a whitish red, or sless the colour, out of woolly or, hairy and boing backs, every one by it selfe, which when they beginne to sade, the whole head becomments more round, and the shakes shew their sine long sharpe points, whereinto the toppes of them were divided; more apparent laid abroadlikes starre, in each whereof is contained one blackish flat seede: in the place about Mompelier, where it growth naturally, it flowreth in May, and the feede is ripe in Isme, but with us it will neither flower nor feede of moneth after.

2. Trifolium clypeatum argenteum. Buckler Trefoile with filver-like flowers:

This small plant foreadeth many branches upon the ground set with Trefoile leaves like the common medow Trefoile, every branch bearing at the end divers filver like flowers, and long round blacke and flat seede like unto the old Venetian Bucklers, which are hot and drie in taste, for which cause I should rather make it a Thlaspi : but in that I have not seene the plant, I can say no further of it, but give it you as my author Alpina hath fet it downe.

hath set it downe.

3. Trifolium globose capite. Globe or round headed Trefoile.

This round headed Trefoile from a long white sibrous and hairy roote, sendeth forth divers sender round stakes a hand breadth high, and sometimes a soore long divided into branches, somewhat hairy best with small riparted leaves, a little hairy, with two small leaves at every joyne, and dented about the edges: the slower are similarly and yellow that grow at the toppes out of the browne sharpe huskes of the round head.

This other globe Trefoile, whose root is small creeping reddilly and hairy hash sunday weak branches lying upon the ground, three or source inches long, being soft, woolly, and somewhat reddills, which but sew small resole leaves set on them, a little waved about the bringues; the toppes of the stakes and branches are garnished with faire round heads, whose slowers are of a reddill yellow colour, standing in hairy huskes, wherein a small stede is contained. is concained.

This Trefoile groweth up, with divers fialkes, and broad pointed Trefoile of Freeless.

This Trefoile groweth up, with divers fialkes, and broad pointed Trefoile leaves upon them dented in in the middle like a heart. Let on long fooce stalkes, bure towards the tops, and pearing a small round head with small bladders made of thin skinnes, which are the flowers are past swell somewhat blages, and turne downe their brimnes, forming a head like a Strawberry, of many red graines set together, but greater, in each 1.2 Trifailms stellarum unspectations, of Chiperina meaning huske whereof is contained a few small yel- Starry headed Trifaile of Mompeller, & Buckler Trefoile with live-like Sewan lovels.

lowith feedes, the rootes forced themselves with many long fibres at them. There is the sanother fort hereof whose head is of a another fort hereof whose head is of a deeper or darker colour; but I never saw any of a violet colour; as Chase shift hand to are the flowers also in other things little to are the flowers also in other things little differing from the former a both these forts; and the former a both these in the yeare 1608, and entituled them: I follow, which he gathered figure with as me bove two hundred other legter of deeper of finisher than the forts and law manner of the flower other than the faces and law months of all which seeds I had my part, and by Gowing them saw the faces of a great and by fowing them faw the faces of a great many excellent plants, but many of them.

y. 4. Triprine fregificrum Prifering & Laferanicum tementofore.

12. Spice trifolie foffuceces mirabilis. & altera.
The rare spiked rushic Trefoile.

came not to maturitie with me, and most of the other whereof I gathered ripe scede one years, by unkindly years that fell afterwards have perished likewise.

6. Trifolium frugiferum Lusitanicum tomentosum Strawberry headed Trefoile of Portugall.

This other hath somewhat larger leaves than the last, and pointed at the ends: the heads likewife at the toppes of the stalkes were somewhat large and round like the last, but all woolly, as it were or hoary; this perisheth yearely, with mee, and Mr. Tradescant, who had it from Beel at Lisbone, without bearing us ripe seede, and have not fince procured it from him againe.

7. Trifolium vesicarium lave. Smooth skinny headed Trefoile.

This small Trefoile rifeth little above halfe a foote his thath three or source states a roote with small leaves thereon, very shapely dented about the edges, with long his shape made of small smooth hoary skinnes in fashion of little bladders, set the same of small yellow flower, having small round flat seede afterwards in them:

halless inder these, the heads are made of small smooth hoary skinnes in fashion of little bladders, set dissented in the sand of each a small yellow flower, having small round flat seeds afterwards in them; them is written, and shows.

2. Triffiches respective masses. The greater rough akinny headed Trefoile.

It is not have the them, supplied by the bushes that it groweth among bare or naked to the toppes, bearing remains two cubics high, supplied by the bushes that it groweth among bare or naked to the toppes, bearing remains a small round head, experted over with rough threads, made of many small round skinnes like the own stand dopper yellow flowers signing one of them.

2. Triffiches vertically the presentations. The lesser skinny headed Trefoile.

Remain harved groweth allege under the ground sattened therein by amony threads: the branches likewise with the growing from the thirty bearing on each a small with the growing skinnes, out of which the flowers was the standard of the like manners. The lesser ship skinnes, out of which the flowers was the standard of the like manners. The lesser ship skinnes, out of which the flowers was the standard of the flowers of the standard of the flowers was the standard of the flowers.

It is the standard of the flower standard of the standard of the flowers which the flowers are of a deep yellow, endsting to red, and being remained the standard of the stan while they are fresh, standing in houses, wherein afterwards grow small, white, round seede. I have

Telbell.

placed the figures of them both together, that the divertitie may the better be observed a they are of adying cultie, as by the tafte may be judged.

The Place and Time.

The most of these grow about Mompelier in France, others in Spaine, as hath beene shewed in their description. and some in Germany and Candy also, which flower and feede when the rest doe. The Names.

The Names.

The first is called by Bankinus Trifolium stellarum, and I have added Monspoliums, and the figure not enter before the second by Alpinus Trifolium chye arum ar gentennic the third is Bankinus his Trifolium choi in second by Alpinus Trifolium choi in second in the title; the fift is mentioned by Closus his Cora posseriores: the sixt comming among other seedes from Book. I have so entituled, as it is known; and it may be is a kinde of the seventh which Bankinus termenth Frisolum serials leve the eighth and ninth Bankinus calleth Trifolium Capitulo spumos affero majus. O minus: the tenth and eleventh are so called by Bankinus as they are in their titles: the last two sorts of Rushie spiked Trefoiles are mentioned by Alpinus in his Booke of strange plants, by the name become billing.

The Vertues.

I doe not finde any other propertie in Phylicke that these are applied unto, than hath beene before spokes, for being all of late invention have had no further trial made of them.

CHAP. XXXII.

Trifola pratensia, Medow Trefoiles.

IF the Trefoiles that usually grow in medowes, besides those that grow in our owne Land; there he others that grow not with us, which are fit to be fet together.

1. Trijolium pratenfe uniques purparenus.

Common purple medow Trefoile called field Hony-fuckles.

The medow Trefoile hath many leaves, rifing from the roote, three fet together, and each almost

round, among which rife up fhort stalkes of flowers, not much higher than the leaves, bearing many despepar-plish crimson flowers together in a tust rising smaller up to the roppe, which turne into little cods with small feede in them, the roote spreadeth much, and endureth long. Sometimes this is found with halfe round spots of white in the leaves.

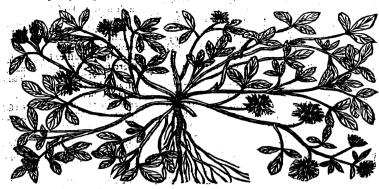

t. Trifelium poe tinfe valgare prapureum.
Common purple medow Trefoile, called field Hony- fuckles.

2. Trifolium pratense album. White flowred medow Trefoile.

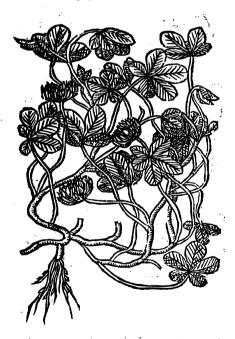

2. Trifolium pratenie Salamanticum Clubi. Medow Trefoi e of Salamanca.

(. Trifolium lateum minimum. The imalleft Trefoil.

6. Daedrifolium pheum fuscum. Foure leafed or purple Graffe.

had there is another fort whose leaves are all longer than the former and pointed, the flowers are of a paler Allera Inch. Of this fort likewile some are spotted with blacke spots. It is tikewise sometimes found, having a tust diverse. aganeleaves on the Stalkes, which as I take is but accidentall, and rather Lufus nature, than any speciall fort, 2. Trifolium pratense album. White flowred medow Trefoile.

This usually groweth lesse than the former, and the flowers are white, and lesse as the head is also, and herein thicky differeth, yet I have seene it sometimes with longer leaves than in others: but this is not Clusius his Tri-ling riman flore also, as Bankins; thinketh, making it the same with that of Matthielm, Dodonaus, Lobel, &c. Alban in that of Clufew rifeth high with few leaves, and fo doth not this.

3. Trifolium pratense Salmanticum, Medow Trefoile of Salamanca. This Trefoile differers little from the second fort of the former kinde, but that the leaves are smaller according *the climate giveth them, dented about the edges, and with a blackifh foot on them, the branches traile on the ground and from the joynts rife the small stalkes that beare many crimson red flowers smaller then our and roan der fet together, the small red scede is conteined in thin huskes.

r fet together, the small red seede is conteined in thin misses.

4. Trifolium pratense minus purpurense. Small purple medow Tresoile.

This small Tresoile hath small shall state a soote high, full of branches bearing on some three leaves, on other branches and joynts, foure fmall leaves like a Lorm, the flowers grow many together at the topped the frigs, being very small and in a loose umbell of a purplish red colour; the roote is slender white and thready.

ing very small and in a sooie unpost of a purposition and the smallest yellow Trefoile.

5. Trifoliom latenum minimum. The smallest yellow Trefoile.

This small Trefoile bath a few stender weake stalkes, little bigger then small Rushes lying on the ground. This small Tretoile hath a rew Herner weaks mane then three on a thore footstalke, a little demedator the whereon grow small Trefoile leaves sometimes more then three on a thore footstalke, a little demedator the edges: the flowers are small and yellowish set close and round together, after which follow small blackish flar and crooked seede, almost like a Medica in the huskes: the roote is small and threaddy. 6. Quadrifolium fuscum. Fower leafed or purple graffe.

The purple graffe spreadeth on the ground; the leaves are in some three in others foure or five on a stalke, of t ne purple grane i preadetti in the ground, the leaves are in the flowers are white; I never faw this big in Gardens where women keepe it with confidence to be good for the Purples in children or others. The Place and Time.

The two first forts grow every where in our owne Land, the third in Spaine, Portugall, &c. the fourth in many of the medowes in France, the tift in divers of our medowes here: the last onely in Gardens as I sayd, for the wilde that is thought by some to be the same is not it, and slower and seede in the Sommer. The Names.

It is properly called relounder in Greeke, and Trifelium in Latine because three leaves are alwayes joyned to gether, and it is probab e that although Dioscorides doth not peculiarly make a Chapter thereof as he doth of L. tus, vethe knew it and made mention thereof, both in describing the Lotus /ylvefris, which as bee faith some called Lybica, as also the Medica whose serves were like unto the Lorus erifolia pratensis, which sheweth plainely he knew it by comparing other herbes unto it. There needeth no great explanation of these Tresoiles for all auhe knew it by comparing other herbes unto it. I here needern no great explanation of these freshes for all suthers call them by this peculiar name of prateins as being most common therein; the third is remembred by Classium, the fourth by Lugdunensis; the sit Dodoness calleth Trisolium agravium, and Lobel Trisolium lineum minimum; and the last by Lobel in his Adversaria; It is called in Italian Trisoglie, in Spanish Trebol de pradoin Franch Tresse de pres; in high Dutch Wysenklee, in low Dutch Claveren, and in English Claver or Clover grass, and Medow Tresoile or Three leased grasse, and of many also Hony sigkles, because Bees seede muchon the

The Vertues. Medow Trefoile both leaves and flowers are thought to be cooling and binding but others thinke them to be of a digesting and suppurating qualitie: but Dodonew who holderh with the first opinion saith that they me held to be good to ease the griping paines of the guts and to avoyd those slienie humours that sticke unto them if the herbe be boyled and used in a Glister, which I thinke it cannot doe by any cooling or binding properties if the herbe be made into a pulcis and applyed to inflammations it will ease them: the juice of it dropped into the pulcies and applyed to inflammations it will ease them: is a familiar medicine with many countrey people to cleare them of any filme that beginneth to grow over them and to take away the pin and web as they call it growne in them. it also allayeth the heate and blood-shooting of them. Countrey people also in many places doe drinke the juice hereof against the biting of an Adder, and having boiled the herbe in water they first wash the place with the decoction and then lay some of the herbeals to the hurt place: the herbe also boyled in Swines grease and so made into an ointment is good to apply to the biting of any venemous creature: the herbe also bruised and heated between two Tites and applyed hat to the Share causeth them to make water who had it stopped before : it is held likewise to be good for wounds, and to take away fearres : the decoction of the herbe and flowers with the feede and roote taken for some time helpeth women that are troubled with the whites the feede and flowers boyled in water, and after made into a Pulis with some oyle and applied helpeth hard swellings and Impollumes.

CHAP. XXXIII.

Trifolia alia. Other forts of Trefoiles.

Here are some other sorts of Tresoiles which could not well be placed in any of the sormer rankes, not in that which must follow, and therefore I thought good to place them together in this. I. Trifolium falcatum. Hooked Trefoile.

The leaves hereof are small and like a Trefoile growing on weake stalkes spreading on the ground, at the joynts with the leaves on all fides of the stalkes and so at the toppes, come forth four or five small yellow flowers set upon short footstalkes, which turne into small crooked cods with very small seeds in them.

2. Trifolium odoratum pelsatum Creticum. Sweete buckler Trefoile of Candy.

This Trefoile from a long slender roote full of fibres sendeth forth small stalkes an handfull high almost bare of leaves, having but few below and fewer on them, yet made into three round parted ones, a little dented about the edges, and standing on long footestalkes : at the toppes of the stalkes grow foure or five small pale yellow sowers flanding one above another on fhort stalkes, after which succeede yellowish flat skinny cods almost halfe round with a prick or pointell at the end, with one or two small flat feeds within them, which code while they are young and greene are very sweete, and eaten by poore people, but when they are full growen and hard are very bater.

3. Trifelium (reticum spinosum. Thorny Trefoile of Candy.

The whole plant hereof lyeth spread round above the ground, ending forth divers square stalkes about a span singly branlong or more full of joynts and branched out from them, where they are of a greenish purple into sundry branched ches, having foure small crooked thornes standing at each joynt, two above and two below, at the joynts likewise Piffeilam ederatum peleatum graffe.

PHE II.

me forth on both fides two small stalkes of small and long greene leaves of three parts, each ending in a small stalkes with showers, each one singly by it selfe, made of five isall blewith purple leaves flanding open like unto the flowers of Pimpernell but greater, with divers threads in with yellow and a long fille in the middle, after which succeede small round heads pointed at the ends, which should ripe bendesh and hideth it selfe under the leaves, and openeth into five parts, in each whereof lyeth on flat and reddish feede, the roote is long with many fibres thereat.

The Place and Time. The first Cluffus fairth was fear him by Gregorius de Reggio from Bosonia, whereabouts he found it growing: the knowland third were of Candy, their time of flourishing being in the end of Summer.

The Name:

The sames of these Trofoiles are expressed in their titles as their severall authors have called them, for Elusius nilist made mention of the first in the Appendix alters unto his History, and in his Cure posteriore; and Baubiwe of the se and in his Prodromse. Of the last, both Clussus in his History, and Banhinus in his Phytopinax, Matinthe Tribulus terreftria of Dioscorides.

The Vertues. Threisnothing particularly mentioned of these Trefoiles what physicall propertie they have, but being of the family may be referred unto them.

CHAP. XXXIV.

Trifelium Cocleatum five Medica. Spaile Claver or Trefoile.

Fithele Medicar I have given you many varicies in my former Booke, but there are fome other omitted that hall be showed in a Table together with those formerly expressed and there are others to be spoken of in this place which were not fir for that, and first with smooth shells, and then of those that are prickly.

Famum Burgundi acum five t Medica legitima Dodoneo Clufio etaliji. Spaile Tenfoile of Burgoine. This faile Tre foile or Claver hath divers weaks greene falker, with divers fanall fad greene Trefoile leaves fulreon without order the flowers grow upon long balkes comming from the joynts and toppes of the many clustering in a thicke floor mit of able with perpleting the floor in the floor mit of a beginning from the joynts and toppes of the many clustering in a thicke floor mit of a beginning from the joynts and toppes of the many clustering in a thicke floor mit of a beginning from the joynts and toppes of the of divers and severall colours as more purple neare a violet, or paler blew, or of a brownich blew, or of mir of divers and severall colours as more purple neare a violet, or part of the France with yellow force also blew and yellow colours, parted, and in some places of Spaine and Narbown in France with yellow some also after which come divers small snaile-like round cods set together not so much twined as many other Make are wherein lye small pale seede; the roote groweth somewhat deepe with some strings and fibres theret shi

2. Trifolium Cochleatum polycarpon five Medicaracomofa. Clustering Snaile Trefoile

2. Trifolium Cochleatum pelycarpon five executive for the final round Trefole leaves on party.

vellow colour and fomewhat fweete, which are followed years (mall flac twined cods lake unto those of the first wares much finaller feede likewife in them: the roote ike confifting of long ftrings which abideth long shooing aw stalkes every yeare.

4. Medigamarina. Sea Claver. The Sea Claver hath fundry hoary trailing branches her sea Clave traces under those training grandles feedon; the ground acfoote or two long, with many fall and very hoary round trefoile leaves on thore foothiks: the flowers are many familiand yellow (tanding at the ends of the branches and many finall writhed fhelis doe followlike unto other fmall Snaile Clavers the roote is beewhat thicke and abideth long.

S. Medica marina major pinola.

Hard and thorny field Sea Claver.

His Claver groweth bigger and greener then the laft, hebien are fmall and yellow comming from the joynts. of the winches, and but one at a place which are followed by faultherd and round prickly heads, whose windings are hardy open differenced, this perifficient yearely. There is another for there of that differenth onely in the imalinetic, which sethe third and fift figure in the generall table of

6. Medica Arabica Camerary five Trifolia cordatum.

Hart Claver of Arabia.
This heart Claver listh, very flender and finall weake baches full of joynts, and round greenish Trefoile leaves monlong footstalkes at them, broad at the end and dented is, making the fashion of a Harr as it is usually expressed, with red spots in each of them: the flowers grow two or thre together at the end of a stalke comming from the jomnifmall and yellow, which turne into imali prickly twining heads like unto other small Medicas : the roote is

Medica echinata parva refla & echinata rotunda (mind. Luglamafe his creeping round prickly Claver of two forts.

8. Medica Langes et altera fpinofd. Moone Claver and Another thorny one.

7. MG

Allera

rcfta.

7. Medica echinata rotunda five Tribulus terreftris minor repens Lugdamenfis. Creeping round prickly Claver.

This round prickly Claver hath very long branches trayling on the ground, with very small trefole kaving them, the flowers are yellow, two or three at the most flanding sogether, which turne into round rougher pickly heads, with small or no show of twining to be seen on them, the roote is small white and thready. There is the small turne of the secretary of the another growing more upright and with foure or five fuch small burres fet together, elfo not differing from it 8. Medica lunda: Moone Claver.

The leaves hereof are small somewhat like unto the first true Claver, and dented about the edges the flower are vellow and the pods very like to those of Marantha his Cytifus, but yet is not the same, this being in being

and that a shrubbe or bush growing high, Other forts of Medicas or Clavers are fet downe in my former Bo ke of flowers, which together with all the other forts are not there expressed, but since obteined, I have thought good to fet in one table, thefe are not formerly mentioned are thele, which Medicatornata, e.c.

O. Medica tornatamajor" & minoris lexis.

The greater and lesse smooth Media ca, turned like a Tun.

Theletwo forts differ not in their growing from the others but onely in their frome, the greater whereof frandeth fingly one at a place, turned like to a Tun, and the leffer hath many together smaller, which two are expressed the two first in the generall Table.

10. Medica tornata finofa. The Thorny Tun like Medica.

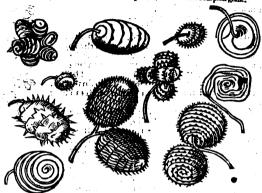

This also hath the chiefe difference in the fruit, which is somewhat like a Tun, but a little thorny or morelike unto a fine wrought haire button, many together which is the fixt figure in the Table. The Place and Time.

The first groweth naturally both in many places of Spaine and in France meare Mompelier also, yet is it sowen in many places both there and in other countries, to serve for Hay for their Cattell and Horses and cut it often, for in Spaine they have no other hey which feedeth their Horses and maketh them exceeding fat, and so doe they in the Low countries, whereby their Kine give the more abundance of Milke : the others grow fome in France others in Spaine or Germany, and some of them also are found in our fields and marshes, as at Woolwich, Dept. ford, coc.

The Names. The first is taken by the most judicious of our later writers to be the wishen of Dioscorides, which as Pliny faith was brought from the Medes into Greece by the Persian Darine his warres there, from whence came the name Medica as the Medicum malum the Pomecitron was also : but now from Italy being brought and sowen for the benefit thereof in the fields of Belgia and the bordering places, and first in Burgonie or Burgandy hath altered the old name into Funum Burqundiacum and of late regained the old name, and called Medica legitima, none as it is faid better agreeing with Diofcorides his description in all things then this: Gerard was much deceived in saying that Lobel his Fanum Burgundiacum was the Trifolium cochleatum primum of Dodonem in his last edition, foritis his Medica in the next Chapter following, as any that will compare them shall soone finde : the second is of Barbinus in his Prodromus, but we having it growing plentifully in our land doe utually call it Medica racemofa: the third Clusius calleth Med ca flave flore, and Baubinus Tr. folium Sylvefire Interm filiana cornuta five Medicafintescens, and Tabermontanus Lens major repens as he faith : the fourth Clusius first called Medica marina and so doe Lobel, Camerarius and others : the fift is of the number of Boel his Spanish Medicas, whereof wee had a dezenor foureteene forts: the fixt Camerarius calleth Medica Arabica and is generally called Trifolium cordaium: the two next are Lugdunenfis his Tribulus terreftris minor repens and rolling, which Camerarian callet Medicapafills : the two lall are lately knowne. The first of these is by Avicen and the Arabians called Cot and Alfal [a]at but corruptly by the Spaniard's Allafalfaga and Alfalfes, but by thele of Caffile Mielguas ; by the French Saintifein and Foin de Bourgongue, we call it Medick, Fodder and Snaile Claver, or Trefoile.

The Vertues. The use of this first herbe was in former times more to feede Cattell then in medicines, for it was held to be so powerfull to fatten their Horses and other beasts that they would stint their to a quantitie for feare of sufficeating them, by growing thereby too fat, the greene herbe faith Dioscorides hath a cooling propertie, and for that purpose chiefely to be used, yet Avicen commendeth the oyle made of Cot or Alfalfas against the tremblings of the heart, Gefuer faith that a liquor drawen by fire out of the Alfalfes of the Spaniar di is good against the Stone, I suppose he meaneth an oyle drawen our of the seede, as the oyle from Almonds. Planach in his booke against Epicarus reciteth a pretty similitude taken from this Medica. Even as (faith he) the feed of Medica abidethalong time by reason of his many winding branches creeping on the ground, and by his sharpe roughnesse, even so greefe having faltened his crooked rootes in ones body cleaveth thereto not for a day or a night, but for many yeares, and is hardl expelled but by other greefes as by stronger nailes. The rest here mentioned in this Chapter are not used against any disease that I know.

Medica tom mai: m frecis sum filiana Scorpioldis tent. Nine forte of Atedicas and a pod of the smooth Scorpion graffe,

.. CHAP, XXXV.

Scorpiolas. Scorpion graffe or Caterpillers.

Ecause these plants come nearest unto the Medica, both in their flowers, pods, & seedes, although differing in their leaves, yet I thinke I doe not greatly one to fet them at the taile of the reli of the Pulles, but I have given you the knowledge of two fores of these Scorpion Grasses in my former Booke, there remaine three more to be remembred in this Chapter to finish this Classis of the Pulles.

1. Scorpioldes Buplemrifelle pluribus corniculis afferts. Small ordinary Caterpillers with many codes: this finalt Caterpiller afto groweth in the fame manner with trailing long branches as the first final rough for some the fame manner with trailing long branches as the first final rough for some final to the leaves are likewise of a fresh greene colour, and of the same fashion, but formewhat leffer: the formallo are finall, and of a deepe yellow, foure or five oftentimes standing together, which are of the same lightly and fashion with the other, but that it hath as many rough crooked cods together as there were flowers. histories very stringy but annuals.

2. Scriphides Buffenrifelio filiquia lembus. Smooth codded small Caterpillers.

This other is in all things like this former fort, but that it hath seldome two slowers together on a stalke, and

he wome that follow as few, being crooked and winding in the very fame manner, are finall and fmooth, without any roughnesse at all, & of the same pale browne colon; that it is, the figure whereof is with the Medicas. Surpicides Matthieli five Portulace folio. Matthielu his Scorpion Graffe, or with Purssane leaves.

1. Surpicides (Marchieli feue Perculaca folio. Marchielus his Scorpion Graffe, or with Pursane leaves. The Surpice Graffe of Marchielus hath diversupright pale greene stalkes, and pale greene leaves set thereon, and merced is somewhat long, broad, and round pointed like a Pursane lease, sometimes having me mall saves joyned at the bottome of the greater, and oftentimes in many without them; at the toppes of the lates, and out at the joynes likewist stand small pale yellow flowers, much resembling those of Medica sin which follow small song stender and crooked hornes, small at the gad, joyned or parted, as it were, all the legible stone what resembling the long crooked cod of the Colura a Scorpicides, but this is more conspictionly joyned; and of a pale colour, within which lie small long whitish yellow seede: the roote is long and sibrous, pushing yearely. The Place and Time.

Both the first were brought us out of Spaine by Boel, as the great one was also expressed in my former Booke: the harms faith groweth neere unto Mompelier, as well in their manured fields, as in their Vineyards plenti-

Storpisides Baplewife to major & miner.
The greater and smaller rough Caterpil. lers or Scorpion Graffe.

3 . Scorpioides Matthieli five Portulace folio. Matthishus his Scorpions taile or Cater-pillers with Purslane-like leaves.

CHAP.

1119

The Names.

No author hith made any mention before now of these, except the sirst by Lobel, who called it Sempidia. Bluplemi folio repens, & the last by Matthiolomiby the name of Scorpoides, & the bare figure without any description, and referred it himselse unto the Scorpoides, yet as he saith, it was controverted in his time by some karned men, that from the authoritie of Nicander his Scholiesse would have it to be Telophema Diescrida. Dedamenting that opinion, saying, it neither pleased him, nor many other learned, yet Gailandinus, Angailans, and offer mus, and with them Bauhimus hold it to be the true Telophimus of Diescridas: Lobel puttern it to the qualitie, whether it be that Telephimus of Cratevas or no, and seemeth to leane to their opinion, saying they are not thereunto by weake reasons; yet because Diescrides giveth to his Teliphimus, and Gales constructing and clensing qualitie, yet not very hot, and thereby conducing to heale soule ulcers, and the taste of this pulies rather like the medow Trefoiles, I may, as I thinke yet continue it in suspense, and the taste of this pulies rather like the medow Trefoiles, I may, as I thinke, being in my judgement mistaken, in making the leaves of this to be like the simal Ribwort Plantane, when as the other Baptenifelio commeth secret thereunto, then this, not having three ribbes to be seene in the seaves, I see lesse reason, for Diescrides, saith Clymenum bath a stalk like the Beane, soure square, but so hath not this, nor hath it those Postparametry is, but that Baptenifelio, hath indeed some resemblance of these rough prieckles, but not this which is smally called Scorpioides Matthios: the other two forts of this, the other which he referreth to this which is usually called Scorpioides Matthios: the other calleth Scorpioides Fortulaca folio; but thinke he can finde no other Scorpioides Portulaca folio, but this of Mussimus also generate our reason.

The Uertues.

The two first soring plants lately made knowne to us, we know of no propertie they have: the last is, as I said of the taste of the Medow Tresoiles, and cannot therefore but be neare of the same effects. If it were the Telephium of Dioscorides, it should have a propertie in it to clense the body from the soule scars of the same that he can cannot need away with Barly water, but this here hash no such clensing facultie therein, nor yet to heale up soule ulcers, as is spoken before, that the propertie should be in Telephium by Galens judgement.

CERE-

CLASSIS DVADECIMA.
THE TWELFTH TRIBE.

CHAP. I.

Triticum. Wheate.

Aving finished the Classis of the Pulles, the next to follow in order unto them is of the Corealis, that is, all the diversities of graine and Coree, whereunto I will adjound with all the severall Pultages and orderings of them, as the old Romanes and Greekes used them in their times for their foode, as meate or drinke, or for medicine which are Alica or Chondrin Crimon, Tragus, P siana Zythum Curmi, and the rest: after which smilt follow the Grasses (for that all the forts of Cornes are the most noble and useful kindes of Grasses, and therefore preferred before them) Rushes, and Reedes.

To beginne then with the most noble Graine of all others, namely Wheate, it is of

whitalke and care, others with a redder, called red Wheate, and fome blew or of other colours, fome flat, others with fingle heads, others with many, some with fingle rowes, others with double; and fome we towne be fore Winter, and therefore called Winter corne; others onely in the Spring, called Sommer corne; to give you ample descriptions of every one particularly, were to enlarge this Volume, and yet to finall pupple: I will therefore give you a description of one that may serve for a generall explication of all the rest, without furth differences as may not be omitted, and yet in as compendious a manner as may be.

I. Triticism frica mutica. Bare or naked hite Wheate.

The white Wheate rifeth up from the creeping joynted roote, with three or foure or more stakes, with faire boad all long greene glasse, like leaves, at every joynt one, & at the fourth joynt usually commeth forth the long enter spiked bead, one like wife on a stake without any branches, which while the head standeth upright bloomed small yellow aglets, and when it is full ripe, boweth downe the head a little with the weight thereof, and is knihtwo double rowes of seeden corne, wrapped up in divers chasses skins or cores, and is when it is clensed dastine compact substance, sumewhat yellowish and cleare with all, and is the chiefest Wheate of all making the purst white bread. We have in some countries of this Land another fort of bearded Wheate, which the country seed call a red strowed Lammas; because the stakes are redder, or else little difference in the care.

county men call a red strowed Lammas; becamse the stalkes are redder, or esse little difference in the care.

2. Triticism drift's manitum. Bearded, or red W heate.

This fort different mot in the manner of growing in any respects from the other, onely the head hereof is larguaged and redder than the former, with source sides seeming to be source square, and bended also: the meate whereof match not so pure white Bread. Lobel calleth this Triticism Loca, from the Dutch appellation, and peradventuring be the Faror Andrews of Plint, &cc.

3. Triticism Lucidum. Bright eared Wheate.

The method shewesth plalnes of the difference, which is somewhat longer and greater, of a right browne blew-

Triticam Lacidum. Bright eared Wheate.

The sire here of the west plaine with difference, which is formewhat longer and greater, of a right browne blew-though, long and goingh, with beardes and anlnes, and the graine harder, and of a browner colours this kinde is too in graine, yeelding much more brantee than the former, making also a heavier and blacker bread. Lobel calbibita Triticum Laca alterum. Lugdunensis seemeth to call it Tragm, and called, as he saith by the French Blemens.

The double eared Wheate Britiseal fo unto the second fort, and different in the eare, chiefely which is shorter, addath divers other small eares rising from the sides of the greater, the beards or aulnes are shorter, and so is the subtrallouthe graine in less is slowler and less compact.

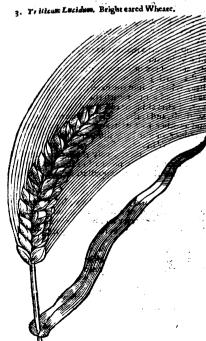

5. Trifsliam Creticum. The wilde Wheate of Candy.

The wilde Wheate of Candy groweth in stalke and leafe like unto ordinary Wheate, the cares are somewhat muster midblicker, the beardes also shorter, and the cornes lesser and blunt at one end, more like to Rie than Wheate.

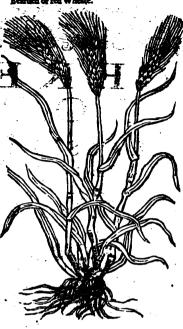

6. Triticum

1. Triticum spice mutica. Beare or naked white Wiegre.

2. Trition wiff in Bearded or red Wheat

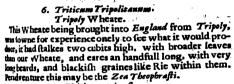

Triticum multiplici fice. Double cared Wheate.

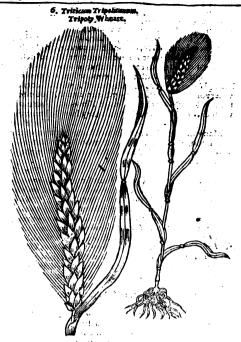

7. Triticum trimestre.
Summer Wheate.

Summer Wheate.

Summer Wheate.

This kinde hath narrower eares, longer beards, and smaller graines, and is onely to be fowne and reaped as Barky is with us, yet as it is earlier sowne in the warmer countries, so it will be the sooner ripe, but will not endure the oldness of our Winters. We have other seeming furnities of wheate growing in our owne Land, well sowne in divers countries which they call by severall sames, as Duckes-bill Wheate, and Cone Wheate, &c. but lannor say unto which of the Cornes, either of the microtor four times they may agree: And I finde that Logistims is sheweth some other kindes also of red wheate goving in the severall parts of France and Italy, as name-your sorting about Lyons, which they call Blernne, ad Corfele, whose cares have have no beatdes, and whose game is the largest and fullest of all others, yet not so sood to make into bread as others, and therefore they there earthly husband it, that when they have hulled it, they be the or a pultage with milk (as our furmentic portage is) carfully husband it, that when they have hulled it, they bykinto a pultage with milk (as our furmentic pottage is) which they greatly affect, and he there faith also, that some would take it to be the Far or Adoreum of the old Roman, whereof when it was hulled and boyled they lived for many yeares in the beginning of the citie, as Thiny faith, I man aniquis Latie cibus, magno argumente in Adores him a diximus, pulte antenn non pane vixisfe, longo tempere hause; manifessum ess, orc. for they lived on Pultage

7. Tritlem trineffre. Summer VV heate.

and not bread for a long time, thus faith Pliny: an other is called Far Classam brought out of Italy, which be fowne in fat ground, bare a stalke as high as a man, or higher, with five Joppes, and as many these and trace at the care an handfull long, the beardes very long and rough, the huskes many thicke and great, that comined long lie nder graine, with a deepe furrow, & hard to be thrashed forth, where Thiny thus saith, it is not to be that as Wheate and Barly, but must be parched as Millet and Panicke is, to be cleaned, and therefore mile to swith the huskes on it. There is another also which they there call Frommens, a fragmens, that is, Wheate with size rowes of corne in an eare, and that in some places of Savey they call it Birigues, because the case is the hought and roughelt, and hath fixe rowes, when others have but foure: there is also another kinde of red Whente bout Manifeo in the moilt grounds, whose come is slender and long; and therefore they call it Day grain, whereof for necessities they make bread, but else they feede their Swine and Pullen therewith, and his may feemelike to Galen his Bryza of Thracia. There are also divers other varieties of Wheate, as Lagdanen fraith, with divers Nations which are very hardly knowne by their doubtfull and double significations.

The Place and Time.

Many of these forts of Cornea have growne with us; but from whence some of them were brought, we know not, saving the double W heate which groweth about Lyons, and that of Candy; the double W heate, Summer W heate, and that of Candy, are to be sowne in the Spring, the rest in Autume, and are resped in August, or the end of July at the soonest.

The Mames. It is called in Greeke auide, in Latine Triticum quod tritum ex fpicu fit, as Varro faith, as also o're, that is, fre. nentum a fruendo, idost, vescendo dictum quod culmus exualit me ait Varro. The first is generally called by all Triticum or aristis carens, and some take it to be Robus, Lobel calleth it Siligo spica mutica: the second (mallothe other fort thereof) is called Triticum aristis circumvallatum, & Loca by Lobel, but most likely to be the Robus other fort thereof) is caused Iritiam and in doment feemeth to make it Triticum Tiphinum, and Tiphacerellisthe third is the Triticum Loca alterum of Lobel, and fet forth to be Tragus by Lugdunenfis, and by others called Tritic cum linidum or Lucidum: the fourth is called Triticum ramofum by Pliny, and Triticum multiplici fica by Lobel, but by Tabermontanus Triticum Tiphinum multiplici spica : the fift Honorius Bellus lent unto Clusius from Candy by the name of Agriostari, and so Pona in his Italian Baldus doth call it, and Framentum sylvestre Creticum, but the figure that hee hath' thereof doth not, in my minde, answer the defcription thereof not having any beardes: the fixe wee have called Triticum Tripolitanum, of the place from whence it was brought, but as I faid, it may, in my minde be referred to Zea, as well from the place, as from the greatnesse of the growth : the last is called Setanium, and Triticum trimestre by Lobel. The Arabiani call it Henta and Hencha, the Italians Fourmente, and Grano ; the Spaniards Trigo ; the French Fronment, the Germans Weifen, the Dutch Terme, and we in English Wheate. It cannot but admire mee to reade the concelts of some of the ancients cocerning come, why fome should have beardes and others not, supposing that in a fertile field, the same kind would be without beardes or aulnes, & in a leane ground it would have aulnes: and againe, that in a drietime or yeare it would be bearded, and in a moist not againe, that great windes cause their beards to be broken, which the quieter doe not : and lastly, that the thicke sowing and growing, doth cause them to be without beardes, when the thinner bringeth them. Gales also writeth in his first Booke and last Chapter of the faculties of Nou-rishments, that both he and his aged father, who tooke delight in Husbandry, having fowed both Wheate and Barly very well clenfed from any other feede scattered or mixed among them, of surpose to prove whether they would change their natures into Darnell and Haver graffe; or whether thefe were naturall feedes of their owne kinde : found that much Darnell rose among the choise Wheate, and but little aweng the Barly : and that much Egilops or Haver Graffe rose among the Barly, whereby it seemeth he doth confirme that current opinion, that these and other graines & seed will change into others, either better or worse; but surely I could never meete with that Countrie or Husbandman that could certainely prove it (although some have averred it verbally & cauntily) that there was any fuch Metamorphifis, but that these & such like weedes too many by a great many; do spring up in the Corne fieldes, notwithstanding the greatest industry any man can use, I doe verily believe, because of the first curse of Godupon the earth, and therefore to cleare the corne, they are faine to weede the fieldes; for the ground it selfe hath so much of the seedes of these weedes inclosed therein, that sowed it selfe before, and were not, nor could not be weeded out throughly, that although every feede were picke that should be fowne, yet when it is Sprung, it will not want these weedes; and in this one point I doe beleeve was Galmand his Father deceived, who although they chose and cleansed their seede, yet they cleansed not sufficiently the field wherein they fowed their feed. And this may also serve for an answer to Matthiolus country men of Austin who by tradition had received that opinion, as many also in our Land have, which sheweth the world is still willing to continue the old errors, but no certaine truth of transmutation or transubstantion, or transmigration, call it what you will, of their Barly into Haver-graffe, or wilde Oates : for let any man trie the truth hereof in his Garden that is well weeded before hand, and so continually kept weeded, and having sowne his Barly or Wheate, or any other graine each by it selfe; and so likewise Darnell, Haver-grasse, or any other seede, if he doe not finde the same seedes doe every one keepe their own kind, but degenerate into other kindes, let him then believe that opinion, and fo will I, but not till then : for the barrenneffe or fruitfulneffe, the moiflure or drineffe of the carth with such like casually a may make any herbe to grow smaller or bigger, which may seemen be akinde of change, but yet is no change of nature or kinde; but the alteration of herbes and flowers to be double, or to want a part of the forme from his originally is but as we call it Lufus or luxus nature, and they will redire ad ingraina, as we fay, as a man that is borne with some mishape or deformitie, as to have sixe fingers on a hand to be bone with teeth, and such like, when as neither the parents, nor the succession proveth such continual: For the werd and appointment of God in nature must stand firme, who in the Creation, set this law to the Herbes and Inte that they should have their seede in them according to their owne kinde, and not according to another kinde.

The Vertues.

Galen faith, Wheate is in the first degree of heate, but neither drieth uor moisteneth evidently, yet Pliny shihit drieth. To eate the cornes of the Wheate, saith Dissertes, is burtfull to the stomacke and breedeth women: a plaister made of leavened bread doth more digest, than that which is made of the Wheate it selfe, by reason of the whole wheate it selfe, by reason of the wheate it selfe, by reason of the wheate it selfe, by reason of the whole wheate it selfe, by reason of the wheater it selfe.

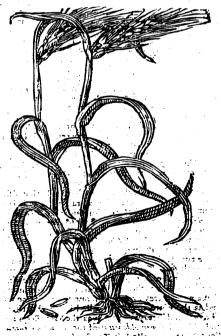

the leaven and falt therein, for leaven hath a power to draw and digeft that which is farre off, Pliny faith that the lawer and saccinetis, not reaven that it a power to draw and digett that which is faire off, Pliny faith that Scale People in that was troubled extreamely with the Gouts, did put his Legges up to the knees into a great base of Wheate, and thereby was eased often and holpen. Pliny faith also that the Cornes of Wheate to the dup-lawer is a pleasant remedy for those that are childed with cold i the oyle presed from Wheate are proporticked plates of Iron or Copper heated doth heate all dangerous terrers and Pinguise. mail from pan, and catter is a present remetal for enough that we can see all dangerous entered and Ringwormes on the known two thicke plates of Iron or Copper heared, doth heale all dangerous tetters and Ringwormes on the known that is a see a see and the s for thin, or other part of the farm oyle to be put into hollow Vicers to heale them up; the fathe allo is bearen in the chappes of the hands of feete by reason of cold, as also to make a rugged skinne smooth : the greene indigenthe chappes of the same of the greene control where the process was a supplied to the process where the process was a process which was a process bud foked in red Rose water and applyed to the eyes that are hot, red and inflamed, or that are blood-shot helpshthem: hot bread applyed for an houre three dayes together, to the throate troubled with kernells or the inservill healeth it perfectly the flower of Wheate mixed with the juice of Henbane doth ftay the flux of limits to the joynts being layd thereon: the faid meale boyled in Vinegar helpeth the fhrinking of the finewes the flow, and mixed with Vinegar and Hony boyled together healeth all freekles foots and pimples on the for: Wheate flower being mixed with the yolke of an Egge, Hony and Turpentine doth draw clente and heale in bie or Plague fore or any other foule Vicer, the Branne of Wheate meale is often boyled in the decoction of the proper ringue tote of any other route viget, the prairie of vicente mease in order poyed in the decoction of these head, and it given in Gliffers to clenic and open the body, and to eafe the griping paines of the intulative faid Branne fleeped in fharp Vinegar and the houd in a Linner cloth and rubbed on those places that have morphew, scurfe, scabbe or leprofite will take them away, so as the body be well prepared and purged limited to the place of the Branne of Whenever or Radio is found of sond wife to be the state of the proper of the Branne of Whenever or Radio is found of sond wife to be the state of the proper of the Branne of Whenever or Radio is found of sond wife to be the state of the proper of the Branne of Whenever or Radio is found of sond wife to be the state of the interest the decoction of the Branne of Wheate or Barly is found of good use to bathe those places that are burtener; the declarations and Branne Boiled in good Vinegar and applyed to fwollen breaks doth help's them, and symbol inflammations, it helpethen, and symbol inflammations, it helpethen also the bitings of Vipers, and all other venemous creatures. The Leavest of whether meale hath a propertie to heate and to draw, and in especiall it rarefieth the hard skins of the seete and other was a propertied to heate and to draw, and in especiall it rarefieth the hard skins of the seete and bols, stalfo warts and hard knots in the fieth, being applyed with some salt: Starch moistned with Rosewater addition the cods taketh away their inching: the Waters that are made of the purest and finest volatile flower smilled to the coustances away then receiving the value and allowed the purch and met volatile flower biggot in water and drunke doth flay the Laske and Blooddy flux, and is profitably used both inwardly and cannot be found to the Rupture in children; and boyled with Roses, dry Figs, and some Injubes maketh a fit Lotion manh fore mouthes or throats, and when the kernells thereof are fwollen and fore the fame also boyled in warranto a thicke gelley and taken, flayeth the spitting of Blood, and boyled with Mints and Butter it held penthe hoarfeneffe of the throate.

CHAP. II.

Zeoprum sive Tritico speltum Lobely. Baltard Wheate.

adde this kinde yet a part by it felfe, being as a meane betweene Zea and Wheate, or Wheate and wheate, or Wheate and this Barley, for as Galen faith in a. Aliment, it grow-thinke coldeft places of Birhysia; as also neare upto dismitted in the further parts of Phrygia which Homer also fretch of, and as the name so is the nature thereof, for he will be the parts of the wheate, by how mebresid of it is by to much worse then Wheate, by how maditis better then Briza of Thrace, thus much is Galens rdition. Dodonaus from Tragm hereunto applyeth the figue of a Corne, which as Trague faith the Germanes call Knumd Drinkelkern, and is the same that Lugdamens calkth Zeeprum gymnocriton, and Lobel taketh to bee that inde of Graine which is brought from beyond Seatunto his and fold at the Apothecaries by the name of Horden medium or mundam, French Barley, Tragmi describing it faithms, it is in stalker, Joynes and cares like l'unto Zea, the Come is not much differing from Wheate, but yet is not moded in Huskes as Zee is, but is easily rubbed forth, and is distillowish colour like Wheater it is fower faith he in centine places of Germany, to serve both for bread, & for the Exchinto boyle in brothes and Tifanes, for which purpofes Eleveth in the flead of Barley; Lugdanenfis also thinketh buthis is very like if not the same kind of Wheate that Rudu faith the French call Scourgeon, as if it were faid Sucm of a darke colour.

The Place, Time, Names and Vertues hereof are fufficientfunction in the description, and therefore there needs no author had of it. Zeopyrum five Tritico fpeltum. Bastard wheate.

Снара

TRIBE 12.

CHAP. III.

Zea. Grecke Wheate.

Here are some other forts of Cornes that more properly may be accounted kindes of Wheat hin of any other fort of Graine, and therefore are to be entreated of before either Rie or Barley index feverall orders, and first of that Graine which the ancients called Zee a diffinet Come diffring from others, and by Disserides said to be of two forts (although Theophrasis and Galen have made me. tion but of one, (which is the Dicoccas of Diofcorides as it is thought, the one Diofcorides callen Di-

coccos the other simplex but first I thinke good to let downe the Zea of Theophrasim as he described it. 1. Zea Theophrafti & mtiquorum. The Zea of the antients or Greeke Wheate.

The Greeke Wheate rifeth up with many firong joynted high stakes and leaves on them most like unto Wheat the Eare is plentifull in Cornes as Theophrasses (aith (bare without beards as Label and some others have thought yet Lugdunensis setteth it forth if his bee true Zou with beards, for Theophrassus maketh no mention thereof) whole Graines are inclosed in many chaffie buskes, being the lightest of others which are not so easily bearen out as wheate, and is very pleasant to all creatures, the rootes are many, and strongly fastured in the ground whereby they draw much nourishment out of the ground, desiring a rich soile, and thereby quickly drawed forth the heart of the ground. This is the truest description of Theophrasses and the ancients Zee, especially drawen out of the ninth Chapter of his eighth booke of the history of Plants. Vnto which of all our graines or of those that the later writers have referred it unto, this may agree thereto in all parts I cannot finde, for neither Mattie. lus his Spelta nor Lugdunenfis his Zea are naked but bearded, nor can it agree with Camerarius his Zea finance. tica, nor yet with Tragm his third Zea picamatica, having neither frong nor tall falker, nor yet many growing from fuch a buthite roote as Theophraftus giveth to his, unleffeit may be faid it is degenerated, for Theophraftus in the eighth Chapter of his eighth Booke faith than Corne is so apr to be metamorphosed wholly into other as Tipha and Zea, but I thinke their transmigrations of plants at as likely as their transmigrations of soules.

2. Zea diescess five Spelsa valge. Spelt Wheate or Spelt Corne.

The Spelt Corne is in stalke and leafe somewhat like unto Wheate but not rising so high, the Eare is smaller and not orderly see in rowes a the Cornes grow double, that is two together, but not inclosed in one haske as many have thought, but in severall huskes and hardly to be

thrashed out, which then somewhat resemble Wheate: 2.3. Zee dicoccos spice mutice & monpeoccos arifiu munice. Spele Wheate and S. Peters Corne. the roote is plentifull in strings and fibres.

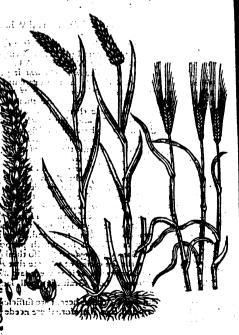

2. Zea monococcos sive simplex sive Bryze

S. Peters Corne. This fpringeth up with a fingle flender and short stalke, but firme, bearing a small thinne spiked care, fee with rough beards like Barley also, being as it were flat, with the Cornes fet onely on two fides, every one conteined fingly in a buske, which are as Tragm faith of a darke red colour, and the Eare also, but in shape like Wheate or Barley, which maketh blacke bread, and of an ill tafte as Mnefitheus told Galen.

The Place and Time. The first was anciently sowen in Greece, Asia and the East countries, and accounted by them to bee next in goodnesse unto the finest Wheate, being a Winter Corne: the second is sowen in many places of Italy and France, and will abide in a month ground holding firme the Winters injuries, yet prospereth belt in a more fruitfull dry foile, and is a Winter Corne fowen in September and Ottober and reaped in Inly. The last is a Summer Corne growing in many places of Italy, &c. where but in want of tester they make no bread of it. The Namet.

It is called in Greeke Cia and Ceia in Latine also Zea le is called in Greeke (se sun program Latino and which Gaza translateth Semestrating it as it is likely) from Pliny, who before him faid that Zea was Far or Adoreum, which was called allo Semen, as the most fingular Corne of any other. The lecond is thought by many tobe the Zea of Theophrifus and Galen, but as I faid it is more likely to bee the Zea of Dieferides (for thele two authors have in many things given names to Plants the one fare differing from the other as may bee knowne by the Mandragores, the one so farte differing of different differ the fame countrey or rather in one and the fame world) and is therefore generally called by most writers Zee

dicoccor, and peradventure was the old Romanes Far and Ador, or femen Adoreum of the later Romanes, and is now called Spelta : the last is variably called by divers. For Matthiolus calleth it Zea fimplex and referreth it to Diofcorides his fecond Zea, which most do call Mourescos and is thought to be that Briza of Galen which he faw in the fields of Thracia and Macedonia and tooke it to

124, which is a forcible argument in my judgement, that Zea is bearded, and called Spetra by Dodoneus. Lebel kZu, which as also by Tragm and Casalpinus, or Frumentum Ronococcum by Dodonem the French and Efpeaute, the Germanes Spelt, Welsche Weyson, and Romsche Weysen, and the last S. Peters Kernand continue listians Pirra, and in Lame places Bisdass, Matthiolus faith, and by that name have I received the Computer of Italy as you that finds it fet downs at the end of the description of the second fort of Barley. The Vertues.

Gold fifth his Zen is in a meane betweene Wheate and Barley, and Diofcorides faith it nourisheth not fo much Wheneyer more then Barley yet is acceptable to the stomacke.

CHAP. II II.

Tipha five Triticum Tiphinum, Light Wheate.

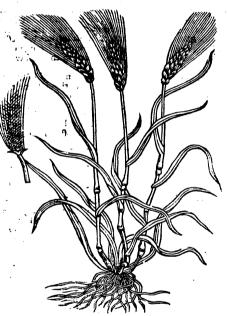

he riseth up with a single and senderstalke or straw, the care is long and round, bearded with long hard sharpe, aunes somewhat closely set together, the graine is small and light but hard, and of a redder colorithen Wheate, inclosed in divers chasse huskes hard to be beaten out; this groweth well in a leane foyle and defireth not a ritch or fat ground as Zea doth.

Triticum Tiphinum alterum five Hiffamicum, Spanis Light Wheate.
Thiother light Wheate different from the former in the particulars, the stalkes are shorter then Wheate, and Indent, the care is small and bearded, with long and Americanes like Barley, the Graine or Corne is formewhelke Wheate but leffer and yellower, and is indosebut in fingle haskes cafe to be beaten out, which hearth it to be differing,
The Place and Time.

Them faith that the first is most sowen in the mounminon places of Alfatia and feldome in any other of the counties of Germany, and especially because their wilde, Swine that will bee feeding upon and destroying any othe Come will not touch this or very hardly, because thesharpe somes will pricke them, and if they should nkemuch of it, it would quickly hurt them and oftenneschooke them : the other groweth in Spains and in the Consist as Lingdown fir faith, for it is often found among the Canary seede that is brought from thence, matter both Summer Cornes, that is, fowen in the Spring adresped in the end of Summer.

The Names. Itiscalled is Greeke Tips and Tipha in Latine, but of orlater writers Tipha cerealis and Triticum Tiphinum, wirmsy bee distinguished from the other Tiphe the mail plant called Reede Mace. The first is not knowne to any in our Land but remembred by Dadonaus and Inquas his third fort of Wheate : Lugdunenfis faith the Dodoneus is much deceived, in thinking this Tipha washar which the French men called Meteil, and they d Lyon dela Mefela (that is our Mastin) being a summe of Wheate and Rie sowen together.

The Vertues. fals sheweth that the bread that is made of 7 ipha is leafar, and much defired both by countrey men and citiamifit be eaten hor, & is better then that which is made doly4 yet if it grow to be two or three dayes old and 1, 2. Tipha Dodonal & Triticum Tiphinum Hiffanicum. Dodonam his Light Wheate and that of Spaine.

hencurait will lye heavie on the fromacke and hard to bee digelled from doe thinke that this is the fweete Come, that Homer sheweth Heltor speaking to his Horses promiseth to give them, for as it is said it may bee pm Horses without any harme when as Whea te cannot.

CHAP. V.

Olyra. Soft Wheate.

His foft Wheate (or Amelkern as Dodoneus faith the Germanes called it) groweth as great and high as wheate, the eare is sharpely bearded like Barley, whose graines or cornes being inclosed in chassie huskes like unto Zea, are being clensed like unto Wheate.

The Place and Time. This groweth faith Galen as well as the other in Alia, &c. and Pliny faith in Egypt, Syria, &c. as also in France but Matthiolm faith he knew of none growing there in his time. It is faith Dodonam fowen in divers TRIBE 12

places of Germany, and is a Summer Corne as many thinke, vet faith himselfe Olyra and Far Clusinam are Winter

The Names.

O'Aven in Greeke is called Olyra alfo in Latine, Gaza tranflaterh it Siligo (which Pliny faith maketh the fweetelt bread and hee altered it to Siligo which maketh the finelt white bread) yet Pliny doth not lay that it is Siligo, although Hermolans, Budeus and Ruellius did fo thinke, for Lugdunenfis faith he can finde no such thing in Pliny; who saith it is the Arinea of the Gaules being proper to their country. Dedoneus calleth it Amyleum frumentum from the Germanes. Amelkern as is faid before, and thinkethit also to bee the Far Halicafrum of Columella, and not much to differ in any thing from the Oriza Germanica of Tragm, who called it also Farcan-didum, and Tragm cerealin, thinking Tragm to bee a kind of graine of it felle, when as it is but a kinde of meate or pulgraine of triefle, which as it is one a single of meater of pull-tage made of Corne, as Alica, Chondrun, &c. are, as shall bee showed hereafter. I have rather called it Soft Wheate after the minde of Theophroftus who calleth it predictio mollior, then Starch Corne after the Germane name. The Vertues.

It is so neare the propertie of Tipha as Galen saith that it is in goodnesse next unto Wheate, and that the worst Olyrais equal! to the best Tipha after the bread made of it is a day or two old, but else being eaten hot Tipha is farre better then Olyra. Pliny faith that of Olyra is made the sweetest bread : Bellonius declareth through all Tarkie they much delight to eate hot bread or cakes, and some sop them in wine and so eate them.

Having now shewed you all the kindes of Wheate, let me a little enforme you (although not without some trouble to my felfe, but much varietie and discordance among the old writers) of the (everall forts of meares, or paleages, and drinkes made of these kindes of Wheate (for those things

that are made of Barley shall be shewed after Barley) which the ancients used for their sustenance and medecine for many hundred yeares, whereof most if not all are quite exiled from use now a dayes, and first of Far.

Olyre. Soft Wheate.

CHAP. VI.

Of Far. "

His word Far is very variably understood and applyed by the old writers : for first it is taken for a kinde of Wheate or Zea as some take it, as Pling sheweth in his 18, Booke and 8. Chapter, where reckoning up the diversities of Wheate, Vulgatiffima (faith he) Far quod Adoreum veteres appellaure,

reckoning up the divertities of Wheate, Vulgatifima (taith he far quod Adorum veters apellavie, Siligo, Triticum, bec plurimis terrincommunia, and in the tenth Chapter of the same Booke bee sain, Ex Arinca dulcifimus pania, ipfa pifor quam Far & majore fpica, eadem & ponderefur, and in other places, but I desire with what brevitie I can to shew it, Secondly for the pultage made of that Wheate as Play in the seventh Chapter of the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith, Populum Romanum tantum ex farre i frumento treening the said eighteenth Booke saith ex farre i frumento treening the said eighteenth Booke saith ex farre i frumento treening the saith experiments and the said eighteenth Booke saith experiments and the said eighteenth experiments and the said experiments and the said eighteenth experiments and the s annis nfum Verrius tradidit, quo tempore nullus fuit Alica ufus. Thirdly it is taken for all other kinds of graines themselves as some thinke, or rather as I thinke for the Pultages made of them as by Columbia appeareth, who themselves as some thinke, or rather as I thinke for the Pultages made of them as by Columbia appeareth, who hath Far Adoreum, Far Triticeum, Far Hordeaceum, and Pliny saith ex Olyra in Egypto Far consciun. And lastly it is taken for the sine meale of that Wheate called Far or Adoreum. Disnisim Balicarassen. faith that the old Romanes did call their marriages papiania, because the married couple did este of that Far together. Some of our moderne writers have taken Far to bee the same with Alica, because of the near manner of their preparations: but as shall be shewed this of Far differeth from that : Archigenes in Atim letteth downe the manner of the preparation hereof in this manner. The Wheate is steeped a while in water, and being taken from thence is cast into a Morter where it is clensed from the huskes and afterwards layd in the Sun and rubbed with the hands untill it bee fully clenfed, which being done it is broken a little greffely, so as every graine may bee broken into source or five peeces, and being dryed is kept to use after the manner of Alica that is boyled. Some also take the greene cares of Wheate and thereof make more pleasant meate and defired then the other. This pultage doth ary well refemble our boyled Wheate, which countrey people doe put into diffee while it is hot, and to bring it to fell in our London markets by the name of Difh Wheate, and Bowle Wheate, and being boyled in milke maketh pottage called Furmentie pottage.

CHAP. VII.

Of Siligo.

His also is diverfly understood by the ancients. for first it is taken for a kinde of Wheate as Plintsaith. His also is divernly undertured by the anticious and that it is taken for a kinde of vy head as a many saming 1.18 cap. 9. Siligineum proprie dixerim Trisici delicias convenieus trattibus humidis, and againe cap. I o.Siligio misquam matureficie parter; and Columella after Robus, which is chiefely to bee sowen: the second fort faith he is Siligio, which is the chiefelt for bread, and in another place nameth Siligio and Hordeum that they can choice whis teporer. Secondly it is taken for a faithtie or degenerate Wheate, as Horaeum trat they can enture veru repores. Secondly it is taken for a faultie or degenerate. Wheate, as charles faith, Omne triticum folo ulignofo post tertiam fationem vertiturin Siliginem. Thirdly it is taken for the full flower of Wheate both by Pliny in divers places, by Celsus and Invonal. By Pliny thus, Institute of egrano consistentiam, e modio reduce fexturios quainor Siliginia. And in another place e Prisma autem simil exturios quinque. Celsus faith Extricio sirmissima Siligo deinde Simila, instrumer ex polline, instrumissima institute in the taken by him to be a courser fort of flower then Simila, as Cibaminist is faid to be the worst, and Invenal in his Satyrs faith,

Sed tamen & nivens mollique Silieine factus.

Servatur domino.

CHAP. VIII.

Of Crimnon,

The Ee finde much diversitie recorded of Crimnon, first that as Galen suith it was wont anciently to be the first of Wheate, as Alica or Chondrus was of Zea: then that Crimnon of the Gracians, and Simila or lase of the Latines is the courfer meale of the husked graine called Far whereof they made their pultages where a sale of Olyra. It (faith he) now theth much, but it is (hardly made some reade, but others) hardly willed and it bindeth very powerfully, especially if the Zee whereof it is made be first parched.

CHAP. IX.

Of Chondres or Alica.

Or of the Gracians feemeth to take the name quali granum for the excellencie, and Halica or All ca of the Latines, ab alendo from nourithing for all authors have translated Chondrus, (although Egi-neta maketh Chondrus, & Alica to be two feverall forts, but he is contradicted by all Latine winters;) & is diverfly also understood by the old writers; first for a kind of graine, as Pliny in reckoning up the kindes of former Cornes nameth Miller, Panick, Lentills, Cisers, Alica, and Galen primo alimentom lith Alica ex genere tritici eft, and Paulus Agineta faith Chondrus is like unto Wheate but more glutinous; bumoe qually for the most excellent meate or pulsage that was used in those times. Dispersides saith Halica is saited for called dispers, Galen, Paulsa, Egineta and Fries show in many places of their workes that it was allogof Whente ind other forts of Corne: but that Far and Halica were different forts of meate is winder allo of Whente and other forts of Corne: but that Far and Halica were different forts of meate is have difficiently by Flingand others, for Pling faith lib. 18. cap. 8. Alind este Zeam egas six Alind vero fe, and in the Chapter before, the old Romanes lived onely of Far made of Whente 3000 yeares, and in the 22. Boke and 35. Chapter he faith that Halica was a meate lately knowne, and as he thinketh not in nie before the two of temperies magness. They have been of making it Pliny setteth downe lib. 18. cap. 17. Alica saith hee is made stanful steeped in water thinket eaten in a woodden morter, for a stop morter would breake it too much the list made by the painteful attent of those that were bound to their setted for the chiefe menhad one of Iron) thus to being best coff it was againe beaten in the same manner, this the haked graine might be broken, and is shought to be the cond and the greatest yet saith he it had not the white fig. that commended it will like were purpose to the list graine find the second and the greatest yet saith he it had not the white fig. that commended it will like were purpose the painted by the wood of the saith provides the saith provides and sait of the saith provides the saith provides and sait of the saith provides the saith of the saith provides saith it nourishes must be taken was the saith provides in the saith provides and saith the saith saith provides saith it nourishes more than the eye, the descript of the saith and is be pefull in the beginning of a Planla in the eye, the descript there of a saith and is be pefull in the beginning of a Planla in the eye, the descript there is and is be pefull in the beginning of a Planla in the eye, the descript the reprose, the saith and is be pefull in the beginning of a Planla in the eye, the descript the saith and is a saith or the saith and is the pefull in the beginning of a Planla in the eye, the descript of the

CHAP. X.

Of Atbera.

I locorides faith that Athera is made of Zea finely ground, but is made into a kinde of supping like liquid pappe, and given to Infants, and is also used in pultesses to be applyed outwardly. Burthers be some authors that a dirme it was made also of Wheate Olyra and Amylam, and thereupon have see downe that the Booke Binders Palte is this Athera. CBAP.

CHAP. XI.

Of Tragus.

His also hath beene diversly interpreted by writers, some taking it for a kinde of graine by it selfenance ly the Triticum lucidum as is faid before, because Dioscorides seemeth to say it carrieth a shew of the graine Alica, and herein Galen also followeth him, but in flead of species of Dioscorides bee but sayed when as Alica as I shewed you before, is not properly a graine by it selfe but is made of Come to Galen him telfe in the faid Booke prime Aliment. faith that Trague is a thing made, and like unto Alica of the he Oftre, husked as it ought to be, then boyled in water, which being poured away, syster sweare wine of horse water was put to it, and Pine kernells fleeped in water untill they were much swollenshe likewife faith lib. H Water was put to le, and rite Ptisanam igitur relle praferri frumentacen edulys, pant schlicet, choudre & Zeaux quan de rat. vitt. in morve actie. 1 vinam gunam Tragus: and Pliny lib. 18. cap. 7. Extrisico Tragus prifana conficiende sungata ratio aft, And againe, Simili males Tritici semine Tragus sit in Campania duntaxat & Agypto, Cassianou Bassianou in Geoponicis lib. 8. cap. 13-laudi was made of the Wheate of Alexandria, Which by most authors is Olyra (for it there groweth best) steped and husked, and dryed in the Sunne often untill it were cleame from the thales: whereby wee may plaintly fresh all forts of graine were husked, and so ordered into divers manners of meate, and called by divers manners according to the graine or countre: it is hard of digestion as some reade, or as others, it is hardly made, and dothloom the belly more.

CHAP. XII.

Of Amylum.

His was made as Dioscorides sheweth of Summer Wheate, and also of Zea, treeped three dayes and nights till it be foft and tender, the water then powred gently from it, and other fresh water to be powred on it, and then troden with the feete till all the course huskes be cleane taken away, by letting the finer part passe through a Sive, which then being dryed in the most hot scorching Sin is soket to be used. Gato showesh that it was made of Siligo, Pliny saith of all forts of Wheate as well in of Siligo, but the best of Summer Wheaterit was so called faith he because it was made without a Mill. It is feld

against defluxions into the eyes to heale hollow Vicers therein, being drunke it stayeth the spitting of blood be. ing put into Milke and taken it helpeshthe roughnesse or hoarsenesse of the throate. Amylum faith he is made also of Zea (and to faith Case alfo, and of Wheate faith, Pliny) (teeped and washed as is above faid abut faith heir but no use in Phylicketbut we use it often for coughes and in defluxions.

> CRAP. XIII. Secale. Rie.

F this kinde of graine besides the common knowne fort, there is two other remembred, the one by Tragus, Dodonaus and Lugdanenses, the other by Baubinus as you shall presently understand.

Secale vulgatins. Common Rie. Our common Ric is to well knowne in all the countries of this Land and to the country people in especiall who feed most chereon that I shall seemeds it were but to teach them that we they know Vitilego Seca ina. Buint Rie.

1. Setale vulgetius. Common Rie,

Britis. burthen I, that is, that it first springethup somewhat reddish, which afterwards groweth greene, and bringeth bert than 1, that is, that is, the what higher than Wheate, bearing at their toppes smaller eates than Wheate, bearing at their toppes smaller eates than Wheate, ford over joints, with fhorter and fharper, rougher, and more prickly awars: the graine within being smaller femBorte, and blacker than Wheate, and is not wrapped in huskes like Wheate, but eafily fallling of it felfe out discure when it is ripe: while it flowreth the eare flandeth upright and being neare ripening it bloweth it of metal values are many, but not is thicke bushing as Wheate, nor confirming the fertilitie of the soyle so

z. Secale eftivam feu minue. Small or Summer Ryc.

This other Rye growerh lower with fewer stalkes, a shorter and leffer care, yet armed with awnes as the o-The other is the graine or corne also is lesser, and is sowne in the Spring onely and herein consistent the dis

3. Secale latifolium. Rye with great leaves .

This Rie hath whiter stalkes then others, round also and straked, the leaves that are let at the joyats are much legs then the common fort, being a cubit long and an inch broad; somewhat sharpe or rough about the edges legs then the care at the toppe is large and great, set with sharpe long aw hea, and as it were dented legs as full hand breadth, the graine within is also like unto Rie, blacking but greater then it, being alwhike Wheate: the roote likewise busheth like the roote of Wheate. The Place and Time .

Thehat is generally fowen in all these Northerne regions and more in Denmarks, and those more Northerly particule where, their climate not ferving fo well for Wheate, and fowne in Otherand Revember, and the found in Aprill onely, and are all ripe in August usually a the last is brought out of the Balt apuntries, and Trainer faith he had onely the leaves and the Eare out of Signer Contarino his Garden.

The Names. This bath not found as yet any Greeke Father to name it, but is generally called in Latine Secale of Plingand is in Ferego alfo, yet Farrago is in many places of him, Varro, Columella, and others, taken for a greene todder frontell, as Pliny sheweth how to make a Farrago of Wheate, Columella of Barly. Varro faith, Farrago was bolled either quod far ferro celum fuit, aut quod primum a Farris segete Farrago seri cepta fuit but the true Farwe concentrate of the best Authors now adayes to be no other things than Barly. Tragus and some others which it to be Silige; Corden on Dioscorides to be Olyra; some others to be the Tipha of Theophrassum, which for diluction sake is called Typa coreasin, and because the Dutch call it Rogghe, therefore Dodonens maketh a Latine range of it, and calleth it Rogga: Both in our countrie, and in others, they have a custome to sow Rye and Wheate percofequall parts in their fields, which they call Maslin, as well in the fields, as in the meale: the French Meteil, & manuculant particular in the state of the st the second, both by Tragm, who calleth it Siligo aftiva, Dodoneus Secale aftivum, Lugdunensis Secale alterum, and Bashinus Secale vernum vel minus: the last is mentioned onely by Bashinus, who calleth it Secale latifolium, adfaith behad it out of the noble Contareno his Garden, a Magnifico of Venice. The Italians call it Segale; the Speciards Centeno ; the French Seele, and Segale ; the Germanes Rocken, and the Dutch, as I faid, Rogghe, and we in English Rye.

The Vertues. Ryeis of a more clammy substance than Wheate, and neither is digested so quickly, nor nourisheth so well, minaccounted to be next in goodnesseunto Wheate, especially if the corne be sweete and good, and the bread well fermented and baked, and giveth a folide and firme nowishment to the body. The medicinable qualities are, timore digesting than W heate, the bread and the leaven thereof ripeneth and breaketh empostumes, biles, and our fores with more speede. The meale of Rye put betweene a double cloth, and moistened with a little vinegr, and heated in a pewter-dish, set over a chassing dish of quicke coales, and bound fast to the head, while it emethheate in it, doth much ease the continual paines of the head : the ashes of Rye straw put into water, and, fuffered therein a day or a night, and the chappes of the hands or feete washed therewith, doth heale them, saith

CHAP. XIIII.

Hordeum, Batly.

E have two or three forts of Barly growing with us in fundry parts of the land, which I meane here to shew unto you, and with them one other not so well knowne unto us.

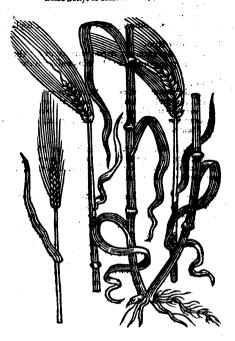

1. Hordeum diffichum. Beare Barly or ommon Barly. The common Barly hath shorter and tenderer stalkes than Wheate, the leaves are shorter, broader and rougher, the eare is short set with two rowes of cornes in very good order, each endold in a buske, and having a long rough awne or beard thereat, which is greater and longer than Wheate, and white allo, and soth not eafily, or of it felfe fall out of the huske : the roote is great, and spreadeth much, having

the more fore of stalkes rising there from, to supply the sleadernesse of the eare.

2. Hordeness difficusts minus. Bigge Barly.

This other differenth not from the former, but that it is smaller, both stalke, eare, and corne, and is sowne the had, and reaped with the foonest; fome doe take this to be Turkie Barly, but I fomewhat doubt that, for harings graine growing in my Garden, taking by some to be Turkie Barly, which is somewhat like this Hordenm-distant, that is with a small bearded care of two rowes: the corne it selfe was like a Barly, but smaller: the bates was brighter and channelled as it were, or furrowed on the one fide, and round on the other, the kernell ring nearer to a Wheate than a Barly, and eafily comming forth of the huske; I am more than halfe perswaded it ithe Zea Monococcos or Briza. We have another fort hereof likewife, whose corne is a little smaller and whitee,

1. Hordeum Difficion. Bears Barly, or common Barly.

9. Hardom potallichom. Square Barly.

called Sprit Barly not differing elfe : if there be a Barly that hath no ailes or awnes faith Label, and so dee I, I know it not

9. Hordeum polyfichum five hybernum. Winter Barly. or fquare Barly. This kinde groweth like the former, both in flalker and eares, differing onely in not having fo many flalker rifing from the rootes, and that the eares are fet with more rowes of cornes, in fome foure, in some five or fix, and that it is sowne earlier than the former.

This other Barly that hath many rowes of ornes in the earc, different not from the last, but in these two particulars, the cornes inclosed in the huskes, have not that skinne on them that the other hath, being lanke small, yellow, and short, almost like Wheate, but lesse, and is sowned in Aprill and not before, and is not seene or sowneby

any almost in this land.

The Place and Time.

The first is our usuall Barley in all the South parts of this Kingdome; the other in the North parts onely; the third is likewise reasonable frequent in our Land; but the last, although it be rare, yet we have had and sowne it in our Gardens, and was ripe in the beginning or middle of Angust: we have not heard by any, that any kinds of Banly hathbeene sowne before Winter in our Land, although Lobel saith so.

The Mame's.

It is called in Greeke 1819 in Latine Hodenn: the first is generally so called as it is in the title: Tragm & Cardin, Hordenn misses, and by Columbia Hordenn: Galacisean, as I thinke, or else the smaller fort of this kinde, because it is whiter: the third Lobel saich is reasonable frequent in this Land, he meaneth in the Wost parts where his chiefe residence was in his sormer dayes, for it is searle seene or knowne in the parts about London, Tragm calleth the Hordenn majon. Cordus bysmale; and others polyfichoms: the last is called by Lobel Hordenn polyfichom verman, & is most likely to be riat which Galon calleth Gymnaevistom, that is Hordenn nations, by which name I had it from a triend, and may be also the Cantherinum of Colomella, which hee saith, the country one called bexessibles in wee have a small kinde of graine brought from Germany to our Drugisle in great quantitie, termed Fronch Barly, and is probable to be this Barly, which Cordus sich, was first sent them out of Italy, having sine rowes in the eares, and not much unlike Wheate, but lesser. Cordus hath set downers more sorts hereof, which I thinke sit to show you hereether two forts of Barly Distiction and Hornestictom, this of sine rowes in the eare, such a recompane in the roote by the greater number of stalkes that rife from themes, for saids be, I have numbered sixtle slakes and hove rising from the roote of one corne, but it usually hath twentie, thirty, and sorts stalkes; but besides elite two,

winds, they have in Germany foure other forts: the first hath the whitest, heaviest, and greatest graine of all the refined called by the country men of Hassis Andrews: the second beareth a little smaller graine, and hath sewer town, and is a Semestre, and is therefore called by the Germanes Winter-gerste, that is, Winter-Barly: the third induce in the Sping, and is ripe in Summer, and therefore they call it Summer-gerst, that is Summer-Barly: the third industry properly be called, saith he Trimistre, because it is early, and cut per in the third moneth after it is said may properly be called, saith he Trimistre, because it is early, and cut per in the third moneth after it is said in this they call Heisen Gersten, and Loye gense, or as the Sanuar doe This perse. Thus much Conduc. The Arasincialist Xehaer, or Sheir, the Italians: Orza, the Spaniand Covada; the Prench Orge, the Germans Garsten, in Duck Gerste and Soverlen, as Lobel saith; and we in English Barly.

The Vertues.

Buty and W heate are the prime graines of all others, and the most profitable and useful for mans life, both for pany and we and medecine, all the rest being as it were but degenerated from them, and partaking of the one other of the natures and qualities of them; yea Barly may feeme to contend with Wheate for prioritie, as all sufe, for although Wheate be the staffe of our life for bread now adayes in our Europe, yet it was not so with the antient Athenians in the Levant, and other of those parts of the world now, where Barly holdeth a furmore ancient. Wheate; but this place will not permit that ample discourse might be faid of it; & howsever we showledge according as the antients have recorded of it, that it nourished the than Wheate, because it is a singular yet besides the medicinal equalities in it, it maketh more wholsome drinks for our bodies, then whate of Wheate alone which lesson surface and too might surface that which the fact where alone which lesson surfaces and too might surface that the state of the surface and too might surface surface a the gaint, yet bettees the menicinal qualities in it, it maketh more whollome drinke for our bodies, than whate can made of Wheate alone, which is too fwere, and too much fluffing the body with humours, and puffing feing white hongions far and fifth, making them that use it unweldy and unfit to follow their necessary adminst harmonic month for this place. Barly in all the parts and compositions thereof, except Mault, is more gapling that where, and a little cleanling, being in the first degree of cooling and drying; it provoketh urine, saith Difficults, it breedeth windings is adverted to the stomacke; but all the preparations thereof, as Barly wau, a grame Tijane drinke, or those other things made thereof, doe give great nourishment to macilent and beide and diseased perfons, or troubled with feavers or agues, and heates in the stomacke, &c. and many of banhare beene, and still are received for good nourishment to the healthfull: the preparations, as they were minuly used, and those that are now in use with us, I meane to speake hereafter severally; I onely meane to Armson here how it is other wife used. A pulcis made of Barly-meale or flower boyled with yinegar and hony, an isw drie figges put to them, dissolveth all hard Impostumes, and asswageth inflammations being applied a saless drie figges put to them, dissolveth all hard Impostumes, and asswageth inflammations being applied a saless being applied a saless being applied and saless and sating solver with memor and Camoning howers, and to an interest, and the spacetes, and the primes in the fides and fromacke, and the windinesse of the fidener: the speake of spirits and Pfilims Flea-worf boiled in water made into a pultis, with hony and oyle of Lillies, applied want curch tumors under the cares, throate, necke, and such like places: a plaister made thereof with Tarre, Wm. and Oyle, helperth the hard fwellings of the throate, called the Kings Evill:boyled with tharpe vinegar in-Wm, and Oyle, helpeth the nare twenings of the throate-caucutte kings articles with Pomegranae-rindes, and Mirmight, and laid on hot, helpeth the leprofie; being boyled in Red-wine with Pomegranae-rindes, and Mirmight, thick the laske or other fluxe of the belly: boyled with Vinegar and a Quince, it eafeth the hot paires of the total Red-Winder, white Salt, Hony, and Vinegar mingled together, is used by divers to take away the infloredily and certainely: the water diffilled from the greene Barly in the end of Mag, is very good for those white the salt of the property of the salt of the s the have defluxions in the eyes, to stay the humours, and to ease the paines being dropped into them, or white had lide to steepe therein, and bound thereto; if Barly halfe sodden be given to Hennes, that hardly or seldome by Egges, it will cause them to lay both greater and more often.

Now I am come to fnew you both what hath beene in former times made of Barly, as what is used to be made therefamong us in these dayes: first I thinke it six to speake of those preparations the ancients used, and then of

those which we use.

CHAP. XV

Of Polenta.

Tax to lenta (which may well be called parched Barly) was antiently made after divers manners, for Pliny in 18. Booke and 7. Chapter, sheweth that some Grecians a sed to make it as well of greene Barly takes his 18. Booke and 7. Chapter, sheweth that some Grecians a sed to make it as well of greene Barly takes ken our of the eare before it was ripe, steeped in water, and after wards steeped and beaten againe, Baskers to take away the huskes, then dried in the Sunne, and after wards steeped and beaten againe, Baskers to take away the huskes, then dried in the Sunne, and after wards steeped and beaten againe, Baskers to take away the huskes, then dried and ground simil, unto twentie pound whereof how soever made, will transfer, and Coriander seede, of each one pound and a halfe, and sour two ounces of sale, all being with two sunds of the steeped and content of the second second will ad those things added thereunto aforesaid, and some Millet seede also. Other Grecians said Pliny, which is the sext day, and then ground it was strong to the sext day, and then ground it was strong to the sext day, and then ground it is said second of the sext day, and then ground it is said second of the sext day, and then ground it is said to the sext day, and then ground it is said to the sext day, and then ground it is said to the sext day, and then ground it is said to the sext day, and then ground it is said to the sext day, and then ground it is said to the sext day and then ground it is said to the sext day. Other Grecians said during the beardes or described the said the sai

K18E 12.

CHAP, XVI.

MATA.

Aca is but Polonia, parched Barly moystened with some liquor, as every one thought meta, susfame used nothing but Water, others put to it both water and oyle together, as Hespehim saith, and some as Hippocrasas shewerth, did put sweete wine to it: and some put honey also: Galen declareth that CMaza of it felse doth hardlier digest in the stomacke, and doth trouble the belly with winde, it is bide long therein, but it doth the sooner passe downe if it be much turned, and honey be put to it.

CHAP. XVII.

Of Ptifaus.

Tifana the most prayled and prayle-worthy drinke, supping or pultage (call it how you will) was used anciently to be made of divers forts of graine, and not altogether of Barly, for they had their I fied anciently to be made of diversions of grants, and the and Pliny faith that Hely which was abounding in Rice, made of Prijana thereof, which others made of Barly, and Galon allo face with we are abounding in Rice, made of Pulie, for he nameth Phaceptijana that is made of Lentille, but Prijana imply without any other addition, is alwayes understood of Barley, onely husked for the excellency thereof. The maner of making it is fer downe by divers authors, as Pliny, Galen, Dydimus, and others, but because Hipperates, who is accounted the Prince of Physicions, wrote a whole Treatise in prayse thereof, I will here set downehis word of making it fit for meate or medicine. Take, faith, he of the best Barley, and moysten it with water, let its ord for 3. or 4. houres, then put it into a course bagge, and beate it with a mallet or pestell of wood, until it have cast off the huskes, which then being washed, to take them away, drie it in the Sunne, and keepe it to use soc. casion serveth as Polenta; but to make it Ptisana; it is to be boyled gently in water untill it breake, and that the liquor be thicke like creame, which then is lessifying sweete and subricke or Sippery, and being moderately liquid, quencheth thirft, it hath no aftriction, nor moveth perturbations, nor swelleth in the stomacke, for all the fwelling is tooke away in the boyling, it flicketh not in the breaft or ftomacke, but by the lubricitie is easily die gested and quencheth thirst, by the moiltening qualitie: these properties, faith Galen, recorded by Hyperques, are availeable, both for the sicke and for the sound: Diescerides further addeth; the creame of Pissan, by resfon of the boyling, yeeldeth more nourishment than Polenta that is made of Barly, and is profitable to be bette tharpenesse and roughnesse of the throate, and all exulcerations. This was the manner of the ancients Pissase. for their manner of making and using; but our Physicions in these times use onely Barly husked andboyled in water, and then beaten and strained, putting some blanched Allmonds or Pompion seede, or other cold seeds beaten, ren, and strained with some Sugar and Rolewater; and this is their most usuall Tifane or Barly creame, Some appoint Barly to be leffe fodden, whichis called Barly-water, and therewith is made either Tifane drinker by adding Licoris, Raifons of the Sunne, Maidenhaire, or the like, for fuch as are troubled with coughes, shortensled breath. &c. or elfe with Almonds or cold feedes, make it into an Almond milke, with Suger and Rosewatt, or given to hecticke or macilent and weake bodies: the Barly water alone, or made into a Julip with Sytope of Violet, or Lemonds, or the like, is a fit drinke for those that have hot or burning feaver on them, or are otherwife differenced with heate, or used with some pectorall Syrupes for the cough, shortnesse of winde, hoarse nesse, or the like. There yet remaineth Zythum, and Curmi of the ancients to be spoken of, and both, as Dissent. der faith made of Barly, which because wee suppose in these dayes, they did point to our Ale and Beare, which are made with Mault, the substantial part of the drinkes a I thinke meete first to speake of Mault,

CHAP: XVIII.

Byne five Maltum. Mault.

Tisse onely used this word Byne which by all is referred to Mault, and as the by manner of making set downe by him is shewed plainely: Maltam is a word made Latine from the German Manhand our Mault, both signifying one thing, that is, that manner of prepared Barly, as is fit therewith afterwards to serve to their use, that would make of it either Ale or Beare: the manner of making is as I take it in all countries alike without difference, and so well knowne to all that it is in a manner of the server of the server

needelesse for me to set it downe, thereby to enforme any that having spent their time wholly thereon as being their profession, can tell better how to enforme me, but as in all the relt of this Worke, my endeavours are to enforme & shew those that not knowing wil not refuse to heare and understand, and thus it is Barly islaid in water to soake for two or three dayes and nights, which being swollen in that time, the water is drained from it, and is afterwardes spread equally on the sloore of a garner, or such like place that is close, about halfes foote thicke, and covered with clothes or other things warme, untill it beginne to sprough ready as it were to grow, (which will be per formed within two or three dayes, if the weather be warme, or not very cold, or client will lye longer then doe they turne it before it grow too hot, two or three times a day for a weeke or tenne dayes, both to coole and to drie it, then doe they bring it to the kill, and there dry it throughly with fire made of straw, or other such like light stuffe, to cause it to have the sweeter relish, for being dried with bavens or wood, the mault will taste bitter of the smoake and is soone perceived in the drinke, which will taste bitter. This mask

biret can be nied, is to be ground a little, and then ferveth it for the Brewer to use. If Mault being ground, be add applied in a bagge, or double cloth hor to the sides or belly, pained with stitches or gripings, occasioned with winde, it giveth much case and helpe, and being made into a pultis, asswageth tumors and swel-

CHAP. XIX.

Of Zythum.

Heophrafths and Dioscorides onely, and no other authors before them, that I can finde, have made mention of Zytham, what it is, or whereof it was made, and yet they are so short therein, that we rather understand this by others relation, which thing sheweth it was so common a drinke there in those places of Greece, &c. that they thought it not worth their labour surther to explane it, even as Discordes hath done the like with many herbes that were most common in those times, for he onely faith it is a drinke made of Barly and no more: Diodorno Siculus faith that The bis a trinke made of Barly, and was used in Galatia where was neither wine nor oyle : Pliny after him Sylming titling that of Dairy, and was nied in Guarsa where was netter wine nor oyle's Piny after him hinding forther explained it by faying, Of fundry forth of Graine drink is used to be made, as Zythams in Egypt, Chind Cerea in Spaine (which as it is likely was so in Pliny his time, and that before their planting of Vines Commuter which hath generally now banished that Barly broth, they now drinking eyther faire water alone or with him since Sugar, or to their water put more or lesse wine as they desire to drinke it) Cerevista and other kindes of and other countries, thus faith Pliny: Now the generall Tenet of our times is that it is the fame disk which we now call Beere or Ale, or but varied according to the manner of the countrey where it is made, according to the goodnesse, quantitie and diversitie of the graine whereof it is made, and also of the water: fatforthe water, it is well knowne that there is no Beere tan bee made in the low countries by reason of tributish water, bupwill rafte thereof, and be faire inferiour to that is made in England, and agains it is obgredby many, that the water of our River of Thames about Lander doth make better and stronger drinke (keepagequall proportion in all things) dien that which is made of other spring or River water elfe where : and for be production of the graine and the well ordering and making it into Mault, it is well know de allo to make the and the street or worfe ftronger or weaker; the diverfitier of graine ale carfeth diverfitie of drinke : for if it Smille made of Wheatealone it would be too thickey too I weete and fulfome as I faid before, or of Oates storit would be too poort and thin and for the quaptitie that is all in all to make it mightie se durable even two arthreveares, or poore and weake not to laste a moneth. But Petrus Bellonius in his second booke of observamusing 8. Chapter is of opinion that this Zythum of the ancient Gracians is the fame drinke that the Latines alki Polca or Pufca, wherof Columella, Serapio and Avicen also make mention : but differeth as hee faith from Corrife Ale, because it is white like milke, thicke and of a good nourishment, and furning into the head causing aunkennesse if it bee too largely taken and this kinde of drinke faith hee is usually fould in all the cities of Affa inthe tappe houses appointed for it, and generally called with them Chowfet; and to strengthen his opiniou alinterspe houses appointed for it, and generally called with them Chonset; and to strengthen his opiniou also beginning place in Successing, where him related that Cesars bonding that fled from him was found at Casar bonding Posain a tappe house, and therefore that Posa could not be Determined (which is Vinegas and water) in this support in his annotations upon Bellonius at the present in Classic into Expire, the weeth himmitolit errours in this his io saying the manner of making this Changes of drinks in the thin kenot amise himmitolity errours in this his io saying the manner of making this Changes of drinks in leverall places. It brinks in the same that you may see the differences of the conjustificions of drinks in severall places. It is said in the same that you may see the differences of the conjustification of drinks in several places. It is said in the same that you may see that differences of the conjustification, which will presently boyse up of it selfs and grow hot, without the helpe of any fire, and become kinde of thicke drinks. The Estates or west thereof, faith he, is white and light, wherewith the Turkis. softmerwater, which will preferrly poyle up of it lelte and grow hot, without the neipe of any het, and become kinde of thicke distalks. The familie or yelf thereof, faith he, is white and light, wherewith the Turkih mornife to annoint themselves, especially when they are in bathing, mixing that tough skinne fund that mornife to annoint themselves, especially when they are in bathing, mixing that tough skinne fund that and this facultie the ancients attributed unto Zythum: and that the Distributed faith, Zythum provoketh line to the interest of the reines and the line west, especially the tunicles that cover the branks, it breedeth windinesse which alood and humbers, and engonite things ficknesse.

His likewife thath no further relation or explanation from Dioscoridis, then that it is also a drinkemade of Barly and was officerused or drinke, nor yet by Pliny surther then as is showed before, that
funde of Barly and was drade in Galifa and other kindes in other countries. We therefore in these times reGreenist was trade in Galifa and other kindes in other countries. We therefore in these sines reGreenist was the most surge to sure the same and in the Land, whereof the Wolfe Copy (which is
that Ale was the most surger and that he was made in the Land, whereof the Wolfe Copy (which is

CHAP. XX.

MINE 12.

our Ale in most places of this Land now adayes is not so well boyled to make it cleane and cleare drinke being to muddy sweete and fulsome, that many loath it, at least refuse it for cause, and in especial because Bere is a charge muddy sweete and fulsome, that many loath it, at least refuse the hoppes make it more durable without the charge that the hoppes make it more durable without the charge that the hoppes make it more durable without the charge that the hoppes make it more durable without the charge that the hoppes make it more durable without the charge that the hoppes make it more durable without the charge that the hoppes make it more durable without the charge that t muddy fweete and fulfome, that many toath it, at tent tent to the hoppes make it more durable without fowling, but chiefely that the hoppes make it more durable without fowling.

To remainst heavy that I should shew you the properties of drinke and of better rellish by the boyling, but chiefely that the noppes make it more curable without formal lesse fulfome and much more wholsome. It remaineth now that I should shew you the properties of Beeread Ale for medecine what diseases they will helpe and what cures they will performe. The graines, their, the Mault that is less after the drinke is drained therefrom besides the fooder it yeldeth for all Cattle or Polline, are Mault that is left after the drinke is drained therefrom believe the total Legs or Feet an Cattle or Poline, are of fingular good use for those that are troubled with lamenesse in their Legs or feet through cold or culture. offingular good use for those that are tronpled with language and in their finewes or joynts, if they fet their Legippotte more fallen into them or oy the intunking and panies in their interests of joynes, and they let them Legispiothe knees into a Barrell or Firkin filled with thefe graines while they are hot, or heated againe if they be cold, which willby using three or foure times as occasion requireth abate both swellings and painers and restore the joyan and sinewes to their proper strength. Strong or good Ale sodden so their proper strength. Strong or good Ale sodden so their proper strength. finewes to their proper itrength. Strong or good Me Jouden to the as a story at may be ipread like falve and applyed warme to the necke or throate troubled with the Kings Evill giveth much eafe; and tendy by the use thereof have also found much comfort for their sinewes and joynes that have had much paine and weakness. in them; the Yeast of Ale serveth our white Bakers of London in stead of Leaven to cause their bread torses. Leven doth which else would be sad and heavie unfit to bee eaten : Of good Ale likewise dilitied with other Leven doth which elle would be the and heavy and herbes, seedes, spice, as of Balme, Angellica, Anesseedes, see, and divers other the like is made an exclient good Aqua vite as they call it, or firong Balme water, &c. but of the dregs of Ale or Beere diffilled the sugar for of Aquavite as they cannot mong banne water, exclain the respect to the properties of Beere and Ale are very like, and therefore whatfoever is faid of the one may very well be referred to the other, For of them is made Dier, Beere or Ale by putting in Spices or paging things, according as the patients discase requireth, and as the Physitians can appoint.

CHAP. XXI.

Avena. Oates.

Here are onely two forts of Oates that may justly challenge any place among the Graines or Cornes which are the ordinary fowen field Oates, and the naked Oates, for the wild Oates are most truly reckoned among the Grasses. I. Avena vesca. Manured Oates.

The ordinary Oates groweth up with divers tall joynted stalkes and leaves somewhat relembling Wheate, bearing at the toppes a large spread tust of many pointed aglets hanging downe like small winged birds from small thread-like stalkes within every one of which huskes lyeth a small and long round graine somewhat like unto Rie, but longer and more pointed: the roote is small and thready.

1. Avena vefca. Manured Oates.

CHAP. 21.

1134

The Nited Oates grow in all points like the former, faving that the graine being somewhat smaller and which the control of all enclosed in the huskes, but is very easily rabbed out with ones hand.

The Place and I sine.

This is both fowen in our fields in fundry places, yet the taked Gates nothing fo frequent, and doe love raise most cold ground then either hot or dry, and are utually the first feede is fowen upon these grounds that are most and stocked up, they are Sommer cornes, that is, sowen in the Spring and mowen in Autumne.

The Name 1.

The Names.

The Na is other Barly is changed into Cares as Firmy 121th, but it is wonderfull that fo great learned men in naturall missibility from the firm of frequent with most of the old writers, as is plainely seene in many places of their workes. For howforthere is a last we nature, many times, and in many things and plants, as by over aboundance or by defect or
his other just parts, yet that any offer transmutation of one species in plants should be into another. I never saw betout juit paints in the wind of the property of the parties in the parties in the parties of the parties in the parties of t granulated and of water wine, it come miraculously, which if it should so happen supernaturally it, must not materies and or water which come in acture is but of this enough here. I have spoken else where somewhat more to misting. All authors that have written of these two graines, doe so little vary their titles of them that they my cay be knowne : the Arabiani call it Chartall, the Italians Vena, the Spaniards Avena and Aven, the French may canyor and we in English Oates and Haver allow The Vertues.

Ornes Galen faith are somewhat cold and drying withall, and thereby doe helpe the laske of the belly, yet is the desired and nourisheth little, like unto Barly faith Galen, but Pliny faith the Germanes lived thereon which is inspect and nour interest interest and on any places, and even in some countries with us also, as Lincolnessive, in our forte this day they make it not onely their bread corne or make cakes, &c., thereof, but they make it also into

kuk, and thereof make their drinke, and are thereby fuhinds live in as good health and strength of body, as those that live on Wheate onely, whereby wee may well percire that it hath a warming qualitie rather then a cold in northment, how foever it may have a cooling in medecanon Outmeale in broth is usually given to binde those that have a Laske or other flux, and with some Sugar is to godeffet given to those that have a cough or cold. Whole Questryed with bay falt and applyed to the fide, takes away the mines of Stitches and winde in the fides or belly, a pulmade of the meale of Oates and fome oyle of Bayes put the burn helpeth the Itch and the Leprofie, as also the Fistu-anof the Fundament, and diffolveth hard Impostumes, the mike Oates boyled with Vinegar and applyed taketh my fitekles and spots in the face or other parts of the

Ishould next unto these graines (if I thought it fitting to mit: Chapter as others have done) ipeake of the burnt Comes of these severall forts before specified, but because threis nothing in them that is worth the Description or hat indeed among the reft, being but certaine eares of Combre and there among the reft that are blafted by caschare sometimes to be seene, or as our English proverbe som kea long harvest of such bad Corne, yet I think it not mife to give you the figures of them here.

CHAP. XXII.

Oryza. Rice.

alice is numbred among the graines or Cornes that are used for sustenance, and therefore must bee set next to Oates, because it beareth the teede in a sparsed juba or rift, yet in a different manner.

knitch up with a stronger stalke then Wheate about a padhigh, with fundry joynts and a large thicke leafe at whof them like unto the Reede, at the toppe it bearetha skiduit (pread into branches, whose blooming is said to pupliff, with the feede standing severally on them, enchedina hard browne straked huske, and an aume at the Uffiligi Trulci & Hordel. Burnt Wheate and Barley.

KIBE 12.

head of every one of them which being hulled is very white, of the bignesse almost of Wheate cornes, blant ar both ends.

CHÀP. 23.

1126

The Place and Time.

The original fourse hereof came out of the East Indies. where it is their chiefest if not onely Corne they live upon and not with them onely but through all Ethiopia and Africa and from thence hath beene brought into Spria, Egypt, Italy, &c. wheretoever it is feene to bee fowen, and loveth onely to grow in moilt grounds, or fuch as may be overflowen in the Summer time, and the waters let out againe, being but a Summer Corne, and is yearely fowen and gathered in the middle or end of Autumne with us, but twife a yeare in divers places of the East Indies, whose goodnesse chiefely confisteth in the largenesse and whitenesse, which the hotter countries onely

The Names.

It is called in Greeke O'guica, and fo in Latine Oryes by all authors, yet some doe call it Italica for a difference to the Oryza Germanica, (which Cordus or Dioscorides faith is called Schwaden with them, or being a kinde thereof at the least, although lesser, having the same talle anduse, and the same proportion in stalkes, leaves, and spikes, with a juba like Milium, growing also in marish and plashy places as Rice doth) yet Hermolaus, Ruellius and tome other have thought it to bee the Hordeum Galaticum of Columella, but I have shewed you what that is in the hapter of Barly: why Galen should account Rice inter legumina potius quam inter cercalia, as he did before of Oates, and of Panick afterwards. manu doe wonder, seeing their formes are so different, but himfelfe I thinke rendereth the reason, because it was not made into bread as the reft of the other Cornes are: The Arabians call it A z and Arzi, the Italians Rizo, the Spaniards Arroz, the French Rys, the Germanes Reiff, the Dutch Rys, and we Rice.

Orige. Rice.

The Vertues.

Rice is chiefely used medecinally to stay the Laskes or fluxes of the stomacke as well as of the belly, especially if it be a little parched before it be used, and Steele quenched in the milke wherein it shall be boyled, being somewhat binding and drying: it is thought also to encrease feed, being boyled in milke and some Sugar and Cinamon put thereunto : the flower of Rice is of the same propertie, and is sometimes also put into cataplasmes that are applied to repell humors from flowing or falling to the place, and is also conveniently applyed to womens breaking stay inflammations when they begin.

> CHAP. XXIII. Atilium. Millet.

F Millet there are divers forts, some familiarly growing in Europe others brought out of the more remore countries, as shall be declared.

1. Milium vulgare album. Common white Millet.

This Millet groweth with many hard joynted tall stalkes full of a white Pith, yet foft and a little hairy or downy on the outfide, with long and large Reede-like leaves at them compassing one another, the toppes of the stalkes are furnished with a number of whitish yellow long sprigges like feathers, bowing downe their heads, fet all along with small seede inclosed in a whitish huske, which being taken forth are of a thining pale yellowish or whitish colour, somewhat hard little bigger then the seede of Fleawort; thereore busheth much in the ground but perisheth yearely.

2. Milium nigrum. Blacke Millet.

This other Millet differeth little from the former, being somewhat lesse with us, saying that as the jula or tuft is brownish; so is the seede also blackish and shining, very like else to the other.

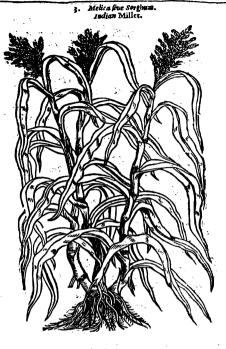

3. Melica sive Sorghum. Indian Millet.

This Millet is in all the parts thereof larger greater and higher then the former rifing to be five or fix foot high or more, the stalkes are ful! of joynts and large long leaves at thom, the juba or tuft standeth upright and boweth not downe the head as the other, whereon frand the feede as big but not flat as Lentills formewhat round, and either whitish, yellow, red or blackish, hard and shining, the roose bushesh more then the other yet perisheth also.

The Place and Time. Millet, of allthe forts came first into Europe out of the Bafterne countries, the two first forts long before the last kinde, and the fortes of it, and require a firong ground well watered, for they foone empowerish a ground it it be not still enriched, nor will it prosper in leane drie soile; it is to be sowne in April, and the graine in the hor ter climates will be ripe in August or September.

1. 2. Oditism unigere album vel nigrame

The Names.

1979? in Greeke, is called Milium in Latine, a miliaria summa derivatum ait Festm, Galen calleth it Paspalos, montes Papale, Varrothinketh it is Meline; but Dioscarides and Galen make Meline to be Panicam. All anounces of the two first forts Milium with their distinctions of blacke and white: the last is called Wilium lucing, by Mathiolus and others, and Sarafenicum by Fuchsun, and Melica by Dodonaus, Sorghum allo, and lusus lustellum by Lobel, Gesner calleth it Panicum Indicum, and Tragus Panicum Dioscoridis and Plinis, Bellonius albuinthat in Cilicia they call it Harcomen as the Arabians doe, whereof they make their Bread or Pultage, and ofthefisikes their fire in want of other fewell, it is called Mazzo di Congo by the Portugalis finding it in that Ingome: the Arabians call it Gegners and Giaver: the Italians Miglio and Sorgho, the Spaniards Milho and Ingome: the Arabians call it Gegners and Hirs, the Dutch Hirs, and wee is English Miller; and the last Min, the French Mill and Miller; the Germanes Hirsz, the Dutch Hirs, and wee is English Miller; and the last Twis or Indian Millet, and of some Italian Millet,

Guler faith it cooleth in the first degree and dryeth in the third almost, and hath withall a little tenuitie of parts: megune faith Theophraftm if it be kept from winde and weather will ever last and abide : it is sometimes made mbreadbut it is very brittle, not having any tenacitie in it whereby it nourisheth little, but dryeth up moist knows, yet is it much used in Germany boyled in milke with some Sugar put unto it: Matthiolsus saith that at knows, yet is it much used in Germany boyled in milke with some Sugar put unto it: Matthiolsus saith that at the said t to specime made thereof called Syrupus Ambrofianus, or as Weeker hath it Syrupus Ambrofig, taken warme with limewhite Wine procureth sweating mightily, being covered in bed, and is effectuall to coole hot Feversand south thirst: being put into a bag and fryed hot easeth the griping paines of the Collicke and of the sides if the applyed, the paines also in the joynts and sinewes: in Italy and other places they give the graine to their him and Pigeons to fatten them. The Indian Millet stalkes faith Matthiolass are good to helpe those that are mobled with Kernells under the eares or else where, in this manner: Take the pith out of ten of the joynts of talkes of this Millet, which being burned with a new red sponge, take the powder of them with twelve page of Pepper, and an ounce of Wheate Paste or Dowe, all which being made up with a new laid Egge in-Brake, let it be baked under the embers, this cake being divided into fix parte, let the patient take one part of kney other night when the Moone is in the wane as they goe to bed, and not drinke after it that night: this atherepeated two or three Moones, and hereby faith he hath knowne many to be cured : the red flowers faith Rubenin red wine to the weight of a dram cureth women of the reds, as the white flowers doth the whites : it it ogood for all fluxes of the belly.

TRIBE 12.

CHAP. XXIV.

Milium Indicum maximum Maiz dictum, five Framentum Indicum, vel Turcicum aliquorum. Indiau or Turcie Wheate.

Sowies S a kinde of Millet although farre greater and differing notably from the former I must joyne this prine although some have made divers sortisthereof, yet I cannot perceive any more then two special differences, the one beareth eares at the joynes of the stakes, the other at the tops following the flowers the other differences consist not in any other things then the colours, of the blooming first and of the grane afterwards.

1. Mais. Framentum Indicum vel Turcicum vulgare. The ufuall Indian or Turkie Wheate.
This Indian Wheate shooteth from the roote which is thicke and bushie, fundry strong and tall shike strong

eight foote high, as thicke as a mans wrest if it grow in any ranke ground, full of great joynts with a white pith inthe middle of them, the leaves are long, twife as large and great as of Miller; at the toppes come forth many featherlike sprigs, bending downeward, like unto the toppe of Miller, which are ejther white or yellow or blew as the graines in the eares will prove, which. fall away, nothing appearing after them; but while they are in flower at the joynts of the stalkes with the leaves, from within two or three of the lower joynts up towards the toppes, come! forth the cares one at a joynt weh have many leaves foulded over them smallest at the toppe, with a small long bush of threads or haires hanging downe at the ends, which when they are ripe are to bee cut off : which foulds of leaves being taken away, the head appeareth much like unto a long Cone or Pincapple, set with fix or eight or ten rowes of Cornes, orderly and closely fet together, each being almost as bigge as a Peafe not fully round, but flat on the fides that joyne one unto another, of the same colour on the outside as the bloomings were, hard but brittle and casie to bee broken or ground, with a white meale within them somewhat dry and not clammy in the chewing. Lob I expresses the figure of another fort as he thinketh because as hee faith it grew greater and higher, and the roote grew greater, and with more separate tufes, the roote not differing in any thing elfe : but I thinke it no specificall

1. Milium Indicum ma nimum Maie diffum froe Franceium Indicum vet Turcicum. The uluall Indian or Turkie Wheate.

difference, not understanding by any that it is taken for another fort, and therefore I have omitted it and speake no more thereof.

2. Frumentum Indicum alterum five minum. The other lesser Indian Wheate.

This other Indian Wheate is like the former both in stalkes and leaves, but not halfe so high or great, the eare likewise are not halfe so bigge, of as differing colours as it, but they doe not grow at the joynts of the stalkess the other, but at the toppes following the slowers, which maketh a specifical difference between them the graine it selfe is being made into bread not of that nourishing qualitie that the greater sort, is but weaker by much, not is so strong to breede so much blood as it.

The Flace and Time.

The first groweth in the East and West Indies, and from both places have beene brought unto us, and have growne with us, and some ripe cares but not alwayes, and will desire a strong rich ground as the Millet doth, sowne easely in the Spring and ripe in September: The other is a stranger, and seldome seene with us.

The Names.

The Names maketh mention of to grow in Ballria, which he faith was reported to be as bigge as Olive stones, and Pliny following him relateth the same thing out of him, but altereth the Olive stones into eares of Wheate, which sheweth how subject it is to errour, to goe upon hearesay and bare report, for Theophrassus relateth the greatnesse of the graines but by report, which might increase by the way as it did betweene Teophrassus and Pliny his time, to be as bigge as Wheate eares, Mattholm, Dodnems, Lugdunenss and others condemne Fuchsus for calling it Frumentum Turcisms, according to his Countries dialect are sound more just to be blamed themselves, for no doubt but this very Indian Wheate which plentifully is

fund to grow in all the tract of the West Indies, yet not found naturall in any place, but planted every where by the natives, & is the same with Theophrassum and Pliny their Framentum or Trinicum, and Milum Bastrianum India. They of the West Indies called Mair generally. The last is onely remembred, by Tabermentum and Banamar atter him, which Acosta saith the Spanianus in the Indies or the Indian call Moroche: The drinke made of Mair is generally in the Indias called Chica, but by some Asia.

Many doe condemne this Maiz to be as dry and of as light mourifiment as Millet or Panicke, but they doe got as thinke rightly confider the thing, for although the graine be dry, yet the meale theteof is nothing for dry softe Turkie Millet, but hath in it some clamminesses, which bindeth the bread close and giveth good nounthment to the body, for wee finds both the Indians and the Christians of all Nations that feede thereon, are somithed thereby in as good manner, no doubt, as if they fed on Wheare in the fame manner: the sweetnesses of the bread showests the greaten power of nourishment in it, and as some doe thinke breedeth thicke blood and benours able to sufficient by the stand therefore will not unfitly be put into cataplasmes have made to ripen impostumes. Acost a faith that by feeding too much thereon it engenders grosse blood, which reedeth itches and scattle is those that were not used to it. Of it is made drinke also, both in the Indian about the significant will intoxicate as quickly as our strong Beare if it bee made accordingly: but is some to the standard or the standard to bright thereof, the leaves thereof are used also to fatten their Horses and cattle.

CHAP. XXV.

Panicam. Panick.

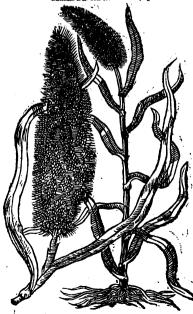

Here is but one fort of manured Panick growing with us in Europe howfoever fome have fet it forth with a larger and leffer spike as the place produced it where it grew, but of Indian forts there are very many brought as continually from the backe of Africa and Euliopia, and from America also where of to make any large mention were to small purpose, and but to fill up roome; I will onely give you the descriptions of a couple, the one more frequent the other more rare as they grew with us, with shiele remembrance of some others.

The Panicke growethup with a reasonable strong joynted stalke full of pith, but not downie as Millet is, having somewhat large leaves on them greater by much then of Wheate, and very neare unto those of Millet that they callady be distinguished, at the toppe of the stalke comments forth a whitish long round close spike, round at the table of the stalke comments of the stalke of it when it is full ripe and opened,

16 Panicum albam vulgaye. Ordinary Panick.

Panicum Indicum paniticula villofe. '

Ecices

full of hairy foft huskes which include a small white feede leffe then Miller but not thining to much, the roote is buffile like unto it but fmaller and dying yearely.'

2. Panicum Indicum pannicula villofa Indian Panick with a more hairy forked bearl.

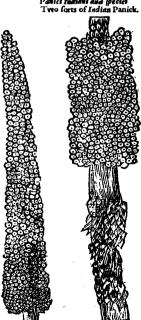

This kinds of Panicke being brought to Brift from the West Indies as Lobel such in his time of abiding there, and there sowen, was like in stalke and teste to the former but greater, and the spiked head grew to bee a foote long but more hairy, bending at the toppe a little, fome what like the great Amaranthus, or flower Gentle.

3. Panicum Indicumezraleum. Blew Indian Panick.

This blew Panick groweth to the lieight of a man, with ftrong and great joynted stalkes like unto a Reede, full of spongie white pith, which neare the ground are of a shining purplish blew colour and preadeth fundry branches with large and long leaves on them compassing the stalke, at the bottome, and thicke ribbes in the middle of them; from the joynts towards the toppe as also at the toppes come forth short round Panick-like heads closer then the former, of as blewish a shining purple colour as the stake below, or rather much more orient and fresh, full of hairy huskes, and finall long blewish round seedes in them like unto naked

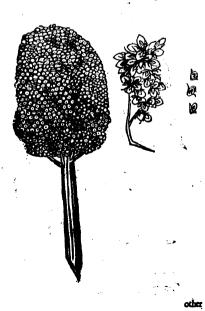

There hath beene brought us from fundry parts both of the East and West Indies by Marriners and Chirurgions divers other forts, some with white heads as big as ones fifte, thicke and faort, with round white feedes, having an hole or dent in every of them. Another whose head was a foore long and with a bowing toppe, as hairy as the fecond fort. Another that was flender a foote and a halfe long, finali at the upper and bigger below like unto that Panicum Americanum that Clusius hath fet forth. Wee have had also another brave spiked head that hath beene bigger then both ones fifts, and a good fpan long, the flake being as thicke as ones finger, of a fine whitish yellow colour. Many

Panici Indiani dua frecies

Panici Americant fecies & sorghi cujufdam. A kinde of Indian Panick, and of a strange Miller.

The Theater of Plants. TRIBE 12.

the late we have first and febre, which not having kept any particular figure or note of them are slipt out of our the fore we have a remembrance further to describe them, and therefore let this suffice to have said so much of the said so mu bontenge and therefore let this in the state of them I here exhibite them unto you,

The most common is onely fowens a Europe where foever it groweth, and as it is likely came out of the Ea-The more communities to wards. India, from whence have come likewife fome of the other, and the reft from the West: less construction and the relt from the West:

| Aprill | April | Aprill | Aprill | Aprill | April | Apr is ne not to have first often simes dorb, and doe both require strong fat ground,

The Names.

[is cilled in Greeke sauge and Panicum in Latine, and usaim according to Dioscorides and Galen, usain as his cauca in which as most doe gather is rather deduced from what quod melleum quidpiam fignificat them from Diele mitnit, which is blacke; and it may be thereupon Pliny calleth it Melfragama, (yet Theophyaffur fpeaketh both of the bash which is blacke; and it may be thereupon Pliny faith Panicam a panicalis dictum fivit, and putteth it among the Open and Azenne as Quasterant prantes. Every must a concern a pamento accum fait, and patteth it among the Consta Disferrides and Columnia die alfo, but Galen as is before fayd among the Legamina Pulles for the reambetore flewed. Backing maketh two forts of the first, the one hee calleth Germanicum panicula minore beindeterent news and the fermany, the head was leffe which Trages, Fuebfus, Cordes and others fer forth, and said in the beginning they cannot be two different plants: the fecond is remembered by Cluffus, Dodoness, with the ferman of there. The Archiver call in Dacham she Italian call in Dac rest land in the organisms diety causion of two different plants: the second is remembred by Clusius, Dodonams, Liel Industrian and address. The Arabians call it Doctom, the Italians Panico, the Spaniards Panico, the French Panic, the Graphungs Pfenick and Hoydel pfenick, the Dutch Penic; and we Panick. The Vertues.

Panklis as Millegoold and dry, and giveth little nourifiment, and as Galen faith Milium is better to all purpos Function as some state of the country people feede after to digett, yet faith he the country people feede after on being boyled in Sites Panick, 1 Weeter but faith he, that of Italy exceedeth ours of Afia: Ioannes Leo in his History of this faith, that in some places thereof they make very fine bread of Panick, of what fort he mentioneth not sir Byth Fluxes as Milium doth, it is given to Pullen, Pigions and other small birds, but hath no further use in Phyfrethen to dry up moist and fluxible humors.

CHAP. XXVI.

Tragopyrum. Bucke-wheate-

a Complement to finish this History of Cornes and Graines I must fet this in the last place, because although the forme and manner of growing be differing from all the former, yet because the seeds serveth to the same use, it is reload by the later writers describedly to bee joy-soluto them. It rises how the divers round hol-

low, brittle, reddifh Ralkes a yard and more high, kt with divers leaves each by it felfe on a stalke, which is broad and round, and by for ked at the bot-me, fmall and pointed at the sad, formewhat re-imbing an Ivie leafe but forter in handling; at the toppeof the stalkes come forth divers clusters of imall white flowers which turne into finali triangular backish seede, somewhat like unto a Beech nut but such leffer, with a white pulpe within : the roote is inall and thready.

The Place and Time, kishought to have beene first brought out of elfixinto Italy, but it is now generally fowen in most of the Northerne countries, where for the use and profiturade of it many fields are fowen therewith, and that usually not untill Aprill, and is ripe in Au-And will not refute to grow in an hungry ground, wisheld generally to bee as good as a dunging to beground whereon it is fowen, the straw thereof alle being turned in thereto.

The Names. lingenerally taken to be the E'quoquer, Eryfinsum of Timbrafiu, which Gaza translateth Trionnes, as the betalie trio of Pliny some to put a difference bewethethis Eryfineum and the other, call this Eryformereale ; it is called by Mathielus , and Lugmengi Prumentum Sarafenicum. Dodonaus Fe-Myram and Tragopyrum, Tragotriticum and Faprinticum as the Dutch names doe import Bookand Buckenweyds. Trague calleth it OcyTragopyrum. Buck-wheate.

mum vecerum, and Clufest and Tabermentame Ocymens cereals, but Dodoness, and Lugdessenfe der menely come. must veterate, and Capies and Tapermonanta Common of Farre, Columella, and the other Laines is no parious diff that opinion, labouring to prove that the Orymone of Farre, Columella, and the other Laines is no parious dict that opinion, labouring to prove that the Orymone of Parry, Common on party and the Salamer is no particle herbe, but rather the name of greene fodder. cut before it grew ripe, to feede carell and to purge them, or sile inversal forts of Pulse and Oates, mingled together and fower to feede them, but Tragge proven it following. leverall forts of Pulie and Oates, mangiou together and rowers to record that, out a regard proven it indiminally from Dates, that Occumum was fowen to facter and purge cartle, and that to be taken while it was influent, whereby it is evident that it could not be a medley of come and pulie fowen together for the purpose, which we have a many than the purpose which the p whereby it is evident that it could not be a meany or come and punte towen together and the purpose, which wer are in flower altogether at a time, but fome particular herbe, and this herbe fooner then any other, which is foone fpringing of it from the feede, which is within three or four edges after the fowling doth applicable many than the control of the control foone (pringing of it from the seeds, which is within a word fignifying cite quickly, from whence Ocymum to be proper thereunto from and, the Greeke word fignifying cite quickly, from whence Ocymum derived and the quality answerable also. The Vertues.

Buckwheate is a graine that as Dodoness faith nourisheth lesse, then either Wheate, Rye, as Barly, but more Buckwheate is a graine triat as possession industries in the freede doth easily diges, yet some sy contrary) and quickely passe out of the stomacke, and giveth small nourishment, though not bad, and is within contrary) and quickely passe out of the stomacke, and giveth imail nourinment, monga not had, and is withall a little flatulent or windy, yet Country people in divers places of Germany and Isasy, doe feede hereon sinos their onely bread graine, and are strong and able persons following strong labour, for the bread or cakes are pleasant, and doe somewhat presse or ye heavy on the stronger, and since exher the like will. And both is, fant, and doe tomewhat presse or my search on the nonments of the secretary and quickly. The secretary of all forth exceedingly, and quickly, was it is no ofcreated and was used generally to fatten cattle and poultry, of all forth exceedingly, and quickly, was it is an ofcreated to the secretary of the secretar on among a great many in our owne land, that what cattle or pullaine foever is fatted there with, if it be not hill on among a great many in our owner intra, time weight earlie or pulsation locked in factor with in the actual led within a flore time after they are thus fatted, they will dye of themselves, being suffocated with their owner fat: it provoketh wrine, encreaseth milke, looseneth the belly, and being taken in white, is good for metandoly persons: the juyce dropped into the eyes, cleareth the sight.

RAMINA, IVNCI, ARVNDINES. GRASSES, RVSHES, AND REEDES. CLASSIS DECIMATERTIA. THE THIRTEENTH TRIBE.

CHAP. I.

Gramina Triticea, Corne-graffes.

HE next Tribe to be entreated of, is of the severall forts of Grasses, which are almost infinite, but because some are growing on the V pland grounds, others in the low and moorish, some in the waters, and others by the tea side, I must divide them; and for a more methodicall and orderly proceeding in them, I thinke it fittelt to ranke them under feverall heads, that fothey may be better expressed and apprehended. I will fish therefore fet downe those graffes that are neerelt in likenesse unto the Cornes in their spiked heads, and after of those that are like the other forts of graine, and then of the rest in their order : but because these Grasses are of small use, although of much varietie and curiolitie, I shall endeavour to be the briefer in them and first of those rictie and cariolitie, 1 man emachement refemble Wheate and Rye.
Graffes that refemble Wheate and Rye.
Close

1. Gramen latifolium frica triticea compatta. Clole eared white Wheate Grasse. The stalke hereof is about halfe a yard high, set with two or three joynts, and faire Wheate like leaves at them a sore long, bearing at the toppes a longer spike than Wheate, and broader, made of severall parts like the bakes of corne, but more separated in funder, the wing it to be a Graffe and no Corne indeede, yet violer than thenest, and without any flaew of heardes or aunes thereon.

2. Gramen latifolium spica triticea divulsa, Thinne cared red Wheare. Graffe. Thirdiffereth little from the former, but in the fpike which bath the finall parts thereof more (eparated and from both lides the stalke, and ermed every one with a small short beard or awne.

B. Gramen augustifalium frica triticea compatia. Closed eared red W heat-grasse. The flalke hereof is smooth and round, two foote high, fet with long narrower white leaves, rough and pointo, the spike is about a spanne long, somewhat like unto red Wheate, closely set, but each of the huskes bath a

4. Gramen anguftifalium frica tricici mutise simili. Rush-leaved white Wheate-Graffe. Thelewes hereof are long and round like Rushes, and pointed at the ends, set on the round stalkes, a foote and shalls high, whose friked toppe is long and slender, without any aw es at the toppes of the huske, and somewhat like auto white Wheate, that is without beardes, the source is white, knortic and creeping.

The greater Spek-wheate graffe.

This facts vooces and stalkes like unto corne of a mans height, suith narrow leaves, the coppes of the talkes like unto corne of a mans height, suith narrow leaves, the coppes of the talkes large findry, long spiles, about a hand breadth long, set on both sides of them one above another, each where lavely like a small sarrow Wheate, armed with small awnes, but very short

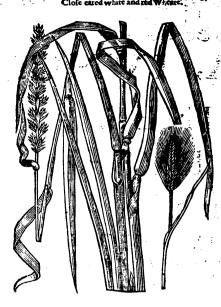

Gramen fica Brize minus. The leffer Spelt Wheate-Graffe. Thirother growth not above an hand bredth-high, with dinall floor, for and hoary knows, the toppe hach foretimes but one otherwhiles, two or three spikes, of an inch long and bearded.

4. 5. Gr amen angullifolium fplea tritiel meile fimils & frica bryga majork. Rufh leafed white Wheate Graffe; and the greene Spele wi

7 Gramen Secalinum maximum.

Rye-Graffe, two great forts. The stalke hereof riseth sometimes to be two or three foote high, having but few and short leaves thereon; the spike is of two, three or foure inches long, bearded, and very like unto an eare of Rye, but with running rootes and joynted. Of this kinde there is a leffer fort also not differing from them before but in the smallnesse, and that the roote is theaddy.

The Place and Time.

Most of these grasses have beene found in our owne land, in pastures and corne grounds in Kent, not farre from the Thames, and flourish when others doe.

The Mames. Each of these hath the name in the title that Baubins in his Prodromus doth call them by, or with very little varietie which is according to Lobels intention.

The Vertues. We know of no use that these are put to in Physicke, and therefore we can fay no more of them.

CHAP. II.

Lolium & Gramen loliaceum. Darnell, and Darnell-Graffe.

Ecause the spiked head of Darnell doth somewhat resemble the spikes of some of the former, I thought it meete to joyne it, and the former.

> 1. Lolium album White Darnell.

The Darnell it felfe hath all the Winter long, fundry long far and rough, leaves (which when the stalke rifeth, which

harded byneed, are narrower but rough full on the toppe, groweth a long spike composed of many heads have another consulting two or three huskes, with sharpe, but short beardes or awnes at the ends, the he was in the ked out of the eare, the huske it felfe being fomewhat tough. 2. Lolium rubrum five Phanix. Red Darnell.

The leaves hereof are (horter and narrower than of Barly, the stalkes are reddish, sometimes halfe a foote high, The leaves in the first and in the first is very like the former, but fmaller and shorter, and sometimes reddish also,

the drier grounds.

Another Darnell with Oaten toppes. The different hittle from the first in rootes, leaves, or stalkes, but somewhat higher, onely the toppes hereof passing in the feveral frades are more like to winged Oaten heades, with there pointes fet on flender foote

Phanks simplici & rarissima gluma. The smallest fingle Darnell-Grasse. the the red Daniell, but that it hath very few flenderer and there it falkes than it, and the leaves

This very like the red Daniell, but that it hath very few flenderer and Morter stalkes than it, and the leaves the shower, the spiked head hath a few single huskos, set very sparsedly thereon.

The shower and red the short of 7. Phonix multiplici fricata panicula. Branched Darnell-Graffe.

This bits flender joynted stalkes, a cubite or more high, and narrow leaves, the spiked head is as it were brandeligoshers, and herein confifteth the chiefelt difference.

8. Phenix multiplics frien nutante. Double Darnell-Graffe with a bowing toppe. This differed litt e or nothing from the last, but in the spiked heades, which are thicker set together, and the noes of them bow downe or turne a little round.

9. Phanix paluftris & longius ficata. Branched Marsh Darnell-Graffe. The Damell-Graffe from a creeping white joynted roote, with many fibres thereat, shootesth forth two or the joynted states of the jo brandof a fing: rs lengh with winged huskes like unto Oates.

The Place and Time. All the grow, either in the fieldes of corne, or in the borders and path-wayes of other fieldes that are fallow,

> T. Taliam albam VV bire Darnell.

2. Phanin froe Lolium rubrum. Red Darnell.

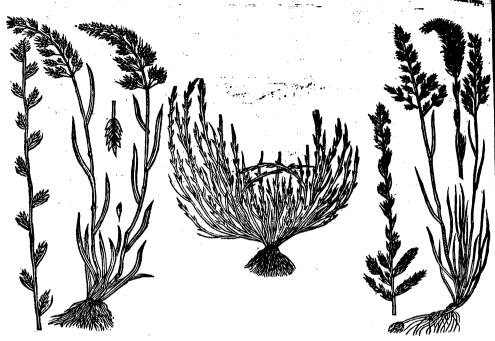

Minus.

3. 5. Lolium alterum av nacea gluma, & altera brevioribus folijs. Darnell with Oaten toppes, and the greater finale Darnell-Graffe.

6. Phonin acerofa acultata. Small prickly Darnell-Graffe. 7, 2, 9. Phenix multiplies phicas paints.
The two forts of branched Durell. One, and the double kinde with a dealer.

and the last fometimes in marsh and wet groundes, as well as in the edges of plowed groundes. Vigil callethin Infalix Lolium, because of the harme it did the fieldes.

Darnell is called aige in Greeke by most Greeke Authors, yet Diago by some, and Lolium in Latine, yet Pliny calleth it Aras well as Lolium; and of some Trisicum temulentum, and by Lonicerum Trisicum fatuum, it is called also Zizania from the Arabians that so call it; the Italians call it Gioglio and Loglio; the Spaniards Taio, and Zizania the French I vraye, the Germans Rueweys sen; the Dusch Luleh, and we in Fnglish Rye and Darnell: the secondis called going Phanix by Dioscovides, and so divers authors doe call it in Latine, a seminiscolore phanice, others callit Lolium rubrum to distinguish it from the former called Lolium album. Dodoneus from Pliny calleth it Hordens murinum, and thereupon the Germans call it Muis Korn, Baubinus calleth it Gramen Loliaceum. All therefiare entituled according to Lobel his intended illustrations, and are some of them mentioned by Baubinus in his Pinar and Prodonus.

The Vertues.

Common Darnell, as Galen faith, is held to be hot in the beginning of the third degree, and drie in the end of the second, it thereby attenuateth, resolveth, and cleanseth, it troubleth the braine and sences, procuring troublefome dreames, if the feedes happen into bread, and if the feede happen into drinke, it will caufe a kinde of giddy drunkennesse: the meale of Darnell is very good to stay gangreenes, and other such like fretting and eating cankers and putrid fores: it also clenseth the skinne of all lepryes, morphewes, ringwormes, and the like, if it be used with falt and raddish rootes : and being used with quicke brimstone and vinegar it dissolveth knot and kernells, and breaketh those that are hard to be dissolved, being boiled in wine with Pigeons dung and Linstede; and is profitable for the Sciatica, if it be bathed in the decoction thereof made with water and hony: it is like wife thought to help conception, if a woman be perfumed with it, and the meale of Barly, Myrrhe, and Francumsense; yet Cornarius thinketh Darnell is unprofitable to be nsed in suffumigations, and therefore addeth the Myrrhe, and Francumience to the decoction for the Sciatica : Darnell meale applied in a pultudraweth forth fplinters and broken bones in the flesh : if the feede be cast into the fire it will cause such a marner of smoke, that it will make all that are in the roome to fall a coughing, and willingly to depart to be eased of the smoaker the red Darnell boiled in red wine stateth the laske, and all other fluxes, and womens bloody issues, and restrained to the state of the neth urine when it passeth too suddenly from one. Some doe hold that if it be bound unto a woman being put in a crimfon leather, or a fearlet cloath, it will flay the abundance of the courses. Ovid the weth by this verse, Et careant lolijs oculis vitiantibus agri, that it was accounted to be hurtfull to the fight, and therefore Planta objected to one that was ill fighted, that he fed on Darnell.

CHAP. III.

Hordeum furium. Way-Barly.

Lthough heretofore there was but one kind of this wilde or Way-Barly knowne yet by the diligent fear h of others, there are some others found, which shall be shewed together.

1. Hordeum faurism vulgare. Common Way-Barly.

This hath divers Graffer like leaves, but somewhat hard, and among them fundry benty stalkes, a foote high, bearing small whitish yellow eares, with long and somewhat rough beardes, whose swithin the huskes is lancke and small, the roote is threaddy and perisheth not.

2. Hordeum spontanemm elatim sive majus.

Great Way-Barly.
Theother doth in all things refemble the former, but that it is the same and taller, and commeth to neare unto the former sadde Rye-Graffe, that many have taken it to be the same, as the same may well be so called also.

midle kye-teraite, that many have taken it to be the lame, as the forset may well be so called also, 3. Hadeum spontaneum pumilising. Dwarfe wild Barly, 3. Hadeum spontaneum pumilising. Dwarfe wild Barly, with small grayish leaves than the common fort, and the spike or ear so nearely resembling common Barly, both in the double rose and beardes, that one would fixely say it was sowned Barly, both at one ly the small nesses and the parts contradicted it.

The Place and Time.

The two first forts are found in dipadry places with us, yet the fifthere usually than the other, but found by those that are expet upon madde walles, and at the force of other walles, and the wayes sides in the fieldes every where: the last was onely foodly Beel in Spaine, and communicated to us.

Itigenerally taken to be Holeus Pliny by the best Herbalists now slayes since Anguilara sirst so called it; and that you may modelled how Pliny describeth his Holeus. I will here set it downess it is lib. 27.cap. 10. Holeus in facin rafeiur sicis, aristas bin incermine tenues, culmo quale Hordeum restibile; bec circa epint silligata, vel circa lacertum educit è corpore aristus, hanc quiamb in Restidain (others have it Aristidam) vocant: others cill it Hordeum spurium or spontaneum; and some others Hordeum morium: Thalius callethit Graminis Loliacei 3. genus; it is callethy the Dutch Hase coren, and by us Wall-Barly, Way-Butly, or Way-Bent or Bennet.

The Vertues.

Ithin power, as Pliny faith to draw thornes, &c. out of the sch: fore fay that it causeth haire to grow; but Lobel faith that the lye thereof maketh haires yellow.

Hordeum fourium five fontaneum .

CHAP. IV.

Avena sterilis & Ægylops. Wilde Oates and Haver-Grasse.

Here are divers Graffes that are like unto Oates, some more or lesse, whereof these that are neerest thereto shall be shewed here in this Chapter, and the rest in the two next that follow.

I. Bromes herba sen Avena sterilis. Common wilde bearded Oates.

The ordinary wilde Oate groweth both in leaves and stalke somewhat like unto the manured out, but that it seldome rise the solid being seaderer, smaller, and softer, the suffed heade is spread in the like man, having such allowinged huskes, with longer awnes at the ends of them, but gentle, and not prickly, man, having such allowed huskes, with longer awnes at the ends of them, but gentle, and not prickly, man, having such allowed such as such as though it had no substance in it: the roote lading by tender small cote stalkes, the seede is small and lancke, as though it had no substance in it: the roote lading.

Avena service mainer. Small wilde Oates.

This wilde Oate is very like the former, but lesser in stalke and lease; the sparsed toppe consistent of many staderlong chassis earlier, bearded onely at the ends, and hanging downe their heads with small seede on them like the former. Of this kinde there is another that beareth not his Oaten toppe untill the other be past.

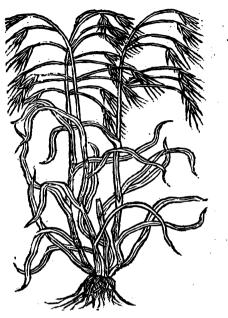

3. Egylops Narbonensis. French Haver-Grasse.

This Haver-Graffe hath divers Graffe-like leaves of a pale greene colour: the stalke is joynted in three or foure like with leaves at the toppes two or three heads, set one above another; which are round and looke such that and striped with divers beards at the ends of them, wherein when they are ripe and looke sushest long, hard and striped with divers beards at the ends of them, wherein when they are ripe and looke sushest long, hard and striped with divers beards at the ends of them, wherein when they are ripe and looke sushes long, hard and striped with divers beards at the ends of them, wherein when they are ripe and looke sushes long, hard and striped with divers beards at the ends of them.

CHAP. 5.

1. Bromos herba five Avena ferille.

3. Feftuca five Egylops Nat bonen fis. French Haver-graffe.

The Abeatom of Plants.

This other Haver-Graffe is very like the last, both in stalke and lease, the toppe onely is in part like unto the bad one, and in this to the fall flaver. Graffe, having some beardes see every huske, within which lye long to be browne seeds: the roope also is somewhat like the last, but the head from whence the sibres proceed, is not

The Place and Time.

The Place

One power, or rather Poots Office. The second is called both by the Durch and us. Dravick, and Dravick Office.

The Vertues.

Th mut knowne to be used to any Philicall use.

CHAP. V.

Gramina Avenacea arvorum. The field Oaten Graffes.

Here are some other forts of Grasses resembling wilde Oates, and called Oate Grasses, whereof some grow in the Fieldes, others on the mountaines, of those that are found in Corne grounds, and other

neids, we will speake of in this Chapter, and of the other in the next.

1. Gramen Brownides maximum birum. Great hairy Oate Graffe.

This great Oate Graffe is all hairy, the stalkes and leaves are greater then of Oates, soure or sive cubirbing, whose panishe at the topic spreadeth into many chasty bearded eares hanging downer their heads, the more is bushly, this groweth in the pastures about London, as also in Esex.

This Corne-Grassen Brownides segetum lations panicula. Great Corne Oate Grasse.

This Corne-Grassen Oate-like talkes, three or source cubits high, the leaves are shorter and narrower, the more is pread much divers stalkes with chastye bearded eares in branches, comming forth at a joynt, broadest below, and spitting small upwards.

2. Gramen Analyse sum in cause.

This bath, (hort narrow, leaves / formew hat pairy and a little hoary withall, the ftalke hath few joynts, the panidesigneed like the last but leffer, and is somewhat hoary: This is sometimes found leffer, and are both found in Minus, the borders of Cornelields, both in Kens and Minus. 4. Gramen Avenaceum pratenfe. Medow Oaten Graffe,

The leaves hereof are thany growing next the roote, long and narrow, the ltake is lefter and lower with fuch a punkleat the toppe, bur leffer spread and not hoary : this is in many Medowes.

5. Gramen Avenaceum/quamofa gluma: Scaly eared Oaten Grasse.

This hath narrow leaves, a little hairy, a spanne long, the flender stalke hath such alike panickle as the last, but that the fealy eares fland fingle, every one upon his owne fmall thredlike footestalke. 6. Gramen Auenaceum pinnata longinscula pica. Winged Oaten Graffe.

O. Gramen Avenaceum pinnata tongenjeues, vv inged Caten Crause.

The stalke hereof is stander, senterimes higher, and sometime lower, the leaves are narrower than the last, the maniele is somewhat long but stind hand not much spreade, each part being as it were winged or devided into indry peeces, upon one is being so the leaves are last a senter being as it were winged or devided into indry peeces, upon one is being so the last a senter last a senter being as it were winged or devided into indry peeces, upon one is being as it were winged or devided into indry peeces, upon one is being as it were winged or devided into indry peeces, upon one is being as it were winged by the last of the senter last of the senter last of the las

of some inches long, of a whirish greene colour, divided into many winged branches many parts being set on both strotthe branch, and each part divided like a Fearne leafe.

8: Gramen Aquenaceum mairorum ereltum. Vpright Wall Oaten Graffe. This Graffe groweth upright, a spanne and sometimes a foote high, the leaves are almost as small as any Graffe the spliced head is an handbreadth long, sparsed or divided each simal care being bearded, the roote is thready: this setten found upon old mud Walles that close in Fieldes. 9. Gra Fftff

1 . 2. Gramen Bromoides plcamm hir futum & lieruja lactore panicula. The great hairy, and great Coine Oate-Graffe,

9. Gramen Avenaceum supiaum arvense. Low Medow Oaten Graffe.

The leaves hereof are as fmall as the laft, an inch, or an inch and a halfe long, the stalkes are slender and weake, lea-ning downewards with a few bearded huskes spike fashion at the toppe.

10. Gramen Avenaceum supinum flosculos Secatinis. Long winged Oate Graffe flowring like Rye.

This Graffe tpreadeth many flalkes not being able to rife up, of a cubit long, full of joynts, and fmall thort leaves on them, of a whitish greene colour, the toppes are furnished with foure or five Oatelike heads, butmore winged and with short aunes, somewhat hard and slowring like Rye.

II. Gramen Avenaceum exile mollicellis folis. Small foft leafed Oaten Graffe.

This small Graffe is very like the Gramen exile during that it may easily be miltaken, and differing from it onely in the leaves, that are longer and foft, as the whole plant elfe is not halfe a foote high, and in the spiked roppe, whose parts are winged.

12. Gramen Avenaceum altero alteri innatum.

Small Oaten Grasse one head set on another. This fine fmall Graffe refembleth well the Gramen Britanicum maritimem, having divers haire like leaves and hard, with fuch like fpan long stalker, some whereof beare their fmall sharpe huskes at their toppes onely as others doe, and

others out of a tuft of leaves in the middle of the stalke, fendeth forth an other thore stalke with such like shape huskes on them as the other.

The Place and Time. All these forts grow in the fieldes of this Land, some in one place, and some in another, as they have been observed either of plowed or fallow grounds, and slower in the Summer scason.

TRIBETS fica & Filicea par fine or Filices paricule, ore. nd the red Ferne-like Orale.

12.11. Gramen Avenaceum altero, alteri innatus exile mollicellà foliji.
Small Oaten Graffe, one headfet on another,
and small fost Oaten-Graffe.

The Names.

Gaste iscalled in Greeke a) posses mages Torayear, quod in agris proveniat, and moz, id off, herba by Theophrastia, which common to all herbes: in Latine Gramen a gradiendo. The severall names of all these Grasses, are exwho is common to an increes: in Latine Gramen a gradiendo. The feverall names of all these Grasses, are expended in their Titles, as much as is convenient for them, being all of late observation, not specified that I know, but before.

The Vertues.

the isno especial property knowne to be in any of them but are as yet onely knowne by their face and name,

CHAP. VI.

Gramina Amenacea nemerum & montana. Wood and mountaine Oaten Graffes.

HE rest of these Grasses, that doe resemble Oates shall be expressed here, whether they be found

in Woods of on hills and mountaines, &c.

I. Granes montaines, Avenaceme Cluss.

Mountaine Oate Graffe with hoary huskes.

This hath fiender roynted stalkes a cubit high, with very narrow and long leaves, and at the toppe a long spiked head, bowing the head close with woolly short huskes, containing seede like

anto those of naked Oates, the roote is made of divers long fibres.

Sometiment avenaceum alterum. Mountaine Oate Graffe, without hoary huskes. There different not in any thing from the former, but in the spiked head, whose huskes are not hoary as

Gramen Avenaceum variore gluma fricatum. Oate Graffe of Denmarke: This mile hath flender weake cleare stalkes, a foote high, with long leaves on them, and at their toppe a weake The grate nam tiender weake cleare trainers, a toole ingu, with one leaving Oatelike feede, the roote is stringle, alterum. adhirgunning under ground. The like hereunto, but with rush-like leaves, and woolly heads, Banbinus akth Granen avenaceum lanuginosam glamis rarioribus.

4. Gramen avenacemm Xerampelium Danicum. Red Oate Graffe of Denmarke. This is somewhat like the last, but with much lower stalkes, cleare and reddish, the huskes at the tops of them at more upright and longer, having the like Oatescede in them. A lesser sort hereof was found about Greene- Alterum, min a hungry foile.

Fffff 2

1 3. Gramen montanum Avenaseum, & Avenaseum rariore gluma frica two. Mountaine
Onte Graffe and Oate Graffe of Denmarke

4 5. Gramen Avenacenm Xerampelium Danicum ea Avenaceum locultis tubris. Red Oate Graffe of Denmarks, and Oate Graffe with red haikes.

6.7, Gramen glumis varijs, & Bromoides frue Averaceum nutante coma spicata.
Party coloured Oate Graise. And with few seedes.

TRIBE! 10.8. Gramen Avenaceum villofa glume, er B. 8. Grames Avenue in Vine Euros, Or A venue cam program, Or A venue am program, Or A venue of Control of Con Wood Oaten Greffe.

5. Gramen avenaceum locustis rubris. Oate Graffe with red husbes?

The roote hereof is long and white, like unto Quiche Grasse, creeping in the ground, having next the ground narrow thort leaves, where the stalke is reddish, but longer up higher, the buskes that are fet sparfedly at the tops. all on one fide for the most part, are of a darke reddish purple colour, and white within, with small feederin them.

6. Gramen elamis varis. Particoloured Oate Graffe. A

The leaves hereof are greene, long, and narrow, from among which rife two or three, fmooth and brittlens-ked stalkes, a foote high, bearing a short spike of small huskes of divers colours the wore is thicke, covered with a rough white barke.

7. Gamen Bromoides five Avenaceum panoigrahum nutante coma fricata. Oute Graffe with few sceles.
This is somewhat hairy all over, the leaves are of a sad greene colour, set on stalkes and or three cubits high, and at the toppes a spiked bending head, having seven or eight small long husked, with sew seeds in them, this groweth neere woods fides in many places.

8. Gramen Avenaceum fulvarum. Wood Oaten Graffe.

The weake stalkes hereof are halfe a yard high with soft long narrow leaves on them, and at the tops of them a few short huskes, and open like unto some of the Oate Grasses before: the roose runneth creeking in the ground.

9. Gramen Avenacehin, exile. Small Wood Often Graffe.
This is flenderer and smaller in all the patts thereof, but standing a little affere up reptight, the roote hereof is fibroug and therein differeth most from the other.

The stalkes hereof are two cubits high, with small narrow leaves, four or the inches long, the spiked head but somewhat long and hairy bushes distinctly set one above another, this is often found lesse by the halfest beroces are threddy and yellowith.

The Place and Time. There doe all grow in Woods and by Wood fides, on hils and the like places, where they flowrift all the Summet time.

The Names. The first is remembred by Clufus, the fifth, and fixth by Banbinus, the rest have not beene specified by any other

The Vertues. None of these are used in Phisicke to any purpose that I know?

CHAPI VII.

Gramen Miliaceum, Millet Graffe.

Here are divers Graffes, whose Featherlike toppes, doe in some fort resemble the bushy toppe of Millet, whereof I meane to entreate in this Chapter, and unto them adde one or two other, which are called Sorghinum, because they are more like unto Turkie or Indian Millet then the former.

the common Millet Graffe, rifeth up with a joynted flender stalke, with two or three somewhat large leaves and at the toppe, a bushy spreading tuste of many long Featherlike springes, consisting of many small birds, within which lye small seede, which the small birds greedily devoure: the roote is bushy and fine baskes, within which lye small seede, which the small birds greedily devoure: the roote is bushy and fine small seede.

2. Gramen Miliaceum alterum. Another Millet Graffe.

Thiother Millet Graffe, hath a fmall weake stalke, a cubit high, with a few narrow leaves, foure or five inches begrowing at the bottome, and two or three thereon at the joynts, the featherlike tuft at the toppe is spread Berginner, but the chaffie huskes are much smaller and finer a the roote is fibrous and reddish. Gramen Arundinaceum paunicula miliacea. A third fort of Millet Graffe.

This hird fort hath fundry reede like leaves, growing from a white fibrous roote, yet shorter then the last, a. mongalichriseth up a stalke or two, about a cubit high, with two joynta thereon towards the toppes, and narthe mildinger leaves standing at them, at the toppes whereof standeth such a feather like toppe as the first, of but three inches long.

4. Gramen Sorghinum. Indian Millet Graffe, or Pipe Graffe.

Theindian Millet Graffe, which the Flemmings call Pipe Graffe, and Lobel thereupon Gramen Sonorum Flanhere, because the boyes there make them pipes of the hollow reedelike stalkes, growing halfe a yard high or hin, with faire long Lilly-like leaves thereon, and a spread spiked toppe of many parts above, somewhat like monte Indian Millet, and larger feedes therein then in Millet, the roote is fibrous.

Thiother fort hath hollow stalkes like the last, but they are weake, bending downe to the ground, and shooting after stalkes like the last, but they are weake, bending downe to the ground, and shooting after stherein, whereby it rooteth a fresh, having narrow long leaves on them, the stalke seeming, as it were runner through them, like to a pipe, and at the toppe such a like spread spiked head as the former, whose heleinthe feverall parts are finaller.

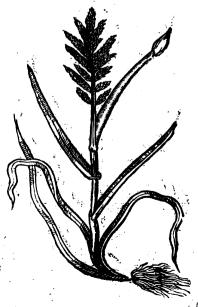

The Place and Time.

They doe all grow in Fieldes, and by the hedge fides, as well in our Land, as in any others, although observed

1. Gramen Miliaceum vulgare. Common Millet Graffe.

4. Gramen Sorgbinum. Indian or Turkie Millet Graffe.

but by few, that are curious in these minutes, and flowrisheth at the same time with the rest. The Names.

The first is called Gramen Miliaceum, by Lobel and others, and is the fourth kinde of Graffe by Delegant, the The first is called Gramen Miliaceum, by Lover and Olices, and Predromm: The fourth is called Gramen, the two next are mentioned by Baubinus onely, in his Pinax and Predromm: The fourth is called Gramen Sorbis two next are mentioned by Banemun onesy, in the Finance and the fifth Graffe by Dodoness, and Gramen fonorum Flandrorum, as is before faid, and is the fifth Graffe by Dodoness, and Gramen and Graffe, but I fall. effigie by Lobel, and Gramen sonorum reanaronum, as is vetere and specific barnell Graffe, but I follow the Laise or Sorebinum by Tabermont anus and Gerard, who calleth it in English Barnell Graffe, but I follow the Laise or Dutch name. The last is of Banhinus his relation likewise.

All these Grasses are neglected, as not usefull in Physicke, and therefore left to the small Birdes to feedenben. as they docupon many other forts.

CHAP. VIII.

Gramen Paniceum. Panicke Graffe.

Here bestundry forts of Graffes that refemble the head of Panicke, some newly, and other longer knowne, some large, some small, all which cannot be comprehended in one Chapter, Impliftere fore thew you some here, and the rest after them.

I. Panicum Sylvestre herbariorum, Wild Panicke of France.

This Wild Panicke hath some neere resemblance unto Millet, in the spreading of the tulted head being composed of sundry parts, each neere resembling a Panicke head, and yet called Miliam sylvestre by some. the joynted stalke with leaves thereon are very like unto Panicke, yet much lesse in all, and therefore is by many like wife referred to Panicke, the roote is fibrous also like unto Panicke.

2. Panicum (gluestre simplici spica. Panicke corne Graffe with single cares. This fingle Panicke Graffe, hath weaker and smaller stalkes then the former, and scarferiling upright, with

thorter leaves on them, the toppes of the stalkes are severally furnished with a spiked rough head, sicking to any garment it toucheth, and small at the toppe full of small whitish seede.

3. Panicum Sylvestre Dalechampy. Wilde Panicke Grasse of Dalechampin: This Panicke Graffe differeth from the last in that it groweth more upright, two foote high, the stalkes have fundry Graffe like leaves on them, but longer and broader, with one usually under the hairy spiked head, which Accidus. Sticke fo fast, to their garments that it toucheth, that it is hardly placked off. There are two other forts hereof.

> 1. Panicum /ylveftre herbariorum. Wilde Panicke of France,

4. 2.3. Panicum fyloefire ariffu longusfiica sumplici, Sylvefire Dalechampij, & ejus varietus. Bearded, single eared, and wild Panicke Graffe,

TRIBE 13. two found in our owne Land, which is smaller, the other at Santa Cruz in Africa, which is larger, and with a

bege spiked head, else little differing. 4. Gramen Paniceum arific longis armatum. Bearded Panicke Graffe. Tiebearded Panicke Graffe, hath stalkes and leaves, not much unlike to the second sort of Panicke Graffe, but The rand taller, having divers browne heades at the tops, one above another, armed with long and sharpe beardes ages like unto corne: the roote confifteth of many long fibres.

5. Gramen Paniceum minus. The lefter Panicke Graffe.
This is lefter then any of the other before, having low bending stalkes a spanne long, and sharpe long leaves like tinto those of Cockes foote Grass, fer spanied long brownish chaffie spiked eares, like tinto those of Cockes foote Grass, fer spaniedly at

6. Gramen Paniceum/Jluestre Anglicum, & Africum. Wild Panick Grasse of England and of Barbary. We have in divers woods with us, a wilde fort of Grasse, whose spike doth well resemble the Panickes befresh we have had one like it, brought out from Barbary, differing onely in the largenesse thereof, both in leafe adhead from our English.

The place and Time. The Graffes grow usually among rubbish, and in waste grounds, and sometimes also in good and manured tide bearing their toppes in Sommer, as others doe.

The Names: The full as I faid, is taken by Clusius to be Milium Sylvestre, by Matthiolus Camerarius and others called Panimilitre, and thereupon Lobel addeth berbariorum, because it was so accounted by the most. Casalpinus calwil amicastrella species. Lugdanensis taketh the third to be the Herba alba Plinis, and Tragus the second to be Milosaberba Plinif, which Cefalpium calleth Panicastrella, and Lobel Panici effigie gramen simplici spica. The forthand fifth, are Labels lecond and third Panici effigie gramen. And the last hath not beene mentioned by any

The Vertues. line second or third, or any of their species be the herba alba of Pliny, then he saith it is hurtfull and dangerous franell, but especially for sheepe to seede thereon : there is nothing else recorded of them by any.

CHAP. IX.

Gramen Paniculatum pratenfe. The Medow tufted Graffe.

F the kindes of Graffe that are called Paniculata, (that is with fmall heades like Panicke, or round and long Catkines, called Panickles) there are divers forts, some growing in the fields and Meddowes, othere in the plowed and Corne grounds, a third fort is diftinguished by growing on hils and in woods, and a fourth fort in the moift plashes of fields, and in the waters: In this Chapter I will first speake of

1.3. Gramen prateufe paniculatum molle, & aureum coma nutante. The foft Medow tufted Graffe. and the golden wited Graffe.

2. Gramen Paniculatum Germani.um odoratum, Sweete Dutch Graffe with a tufted head.

those that grow in the Fieldes and Medowes, and then of the rest in their order.

1. Gramen pratenje paniculatum molle. Inc iore mediow chiles care, tieg from This foft Medow Graffe, hath fundry long and fomewhat broad foft or woolly Graffe-like leaves, tieg from 1. Gramen pratense paniculatum molle. The fost Medow tufted Graffe. a small ruft of short white sibres, and from among the leaves rise up a stalke, two of three, about a cold high, with some sew leaves upon it, and at the toppe breaketh forth a soft woolly spiked head, much divided, whose bloomings are reddish.

2. Gramen paniculatum Germanicum odoratum. Sweete Dutch Graffe with a tufted head. 2. Gramen panientatum Germanicum oaoratum. Sweete Duten Scale And full of joynes, thooting out fibres at creey

Gramen pratense vilgatius majus. I he greater ordinary Modow Graffe,

Gramen pratenfe minimum album. I he leaft white Medow Graffe.

4. Gramen pratenfe minu The leffer tufted Medow Graffe.

4. Gramen pratenfe minimum rubrum. The least red Medow Graffe.

joynt,

The Theater of Plants. TRIBE 13.

jus, the stalkes are two cubits high, with but few joynts on them, whose loaves are almost as long, and some then exceede the height of the stalkes, being narrow and small at the ends, bearing on each a much more close deshing so much spread a Panickle, as the former, and which for the sweetenesse of them, are tyed in small and laide among garments, or linnen to perfume them. s. Gramen Danicala multiplici.

Golden tufted Graffe.

This golden headed Graffe hath many long narrow leaves. nemto other famili Graffes: the stalkes are a cubit high, making tufted toppe, made of fundry Pannickles or foikes missing uncertainted, and of a faire but pale yellowifb co-but therores are many and blacke, ipreading here and merunder ground.

4. Gramen protense paniculatum majus.
The greater jutted Medow Grasse.

This common Medow Graffe, hath many Graffe-like leaves instrument them fundly stalkes halfe a yard high, bearing a found them fundly stalkes halfe a yard high, bearing a found that the toppe of them, somewhat resembling the stabilities head of the Water-reede. Hereof there is anothe kirtfort, and two other forts imaller then they, the one with white tufted tops, and the other with reddish tufted

5. Gramen panicula multiplici:

Medow hard graffe with manifold tufts This nich up with divers (pannelong stalkes, joynted, and institution downewards, the leaves are small like graffe, addended head or Panickle is very much divided, and who ris ripe growerh hard and of a fad reddift colour, the posser athicke buth of white threds.

The Place and Time. Therefow all of them in Fieldes, and Medowes, and are

interperfection in the Sommer time, when others are.

A The Names.
The fifth is called by Lobel, Gramen paniculatum molle, and by Influentis, Gramen lanofum Dalechampij: the second is called h lubinu. Gramen paniculatum oderatum, and Germanicum isiloadded, usually by divers other Herbarists. and Gramen Mouby the Inhabitants where it is natural. The third is calby Luidunensis, Gramen aureum Dalechampij, & by Bauhim, Gramen panicula pendula aurea : The fourth is called both hibbland others, Gramen praterie major unigation, whereof slaid, some are in degree lesser and lesser then others: the billed fort, being the Gramen minimum of Lugdunenfis,

with Bashium maketh the last of the Gramina tremula, calling it Gramen minimum paniculis elegantissimis. The h Buhmu calleth Gramen panicula muleiplici, and faith that they of Mompelier called it Gramen minus durinfenin, and that there is a greater and a leffer.

The Vertues. The Medow Grasse is of most use in Physicke, next to the Quiche-grasse, yet the seedes of these, and not the man, as the rootes of the other, and not the feedes, ferve to open the obstructions of the bowers, and to expell the lone, if the decoction thereof be drunkes being used outwardly they helpe to discusse windy swellings, and bdmmours, that will hardly be repressed or dissolved, the greene hesbe it selfe, is never used Physically that I takine, but the dryed herbe, when it is made Hay, is boyled in water a good while, and then bound to the we of Hories, or Cattle that are chappefalne by too long abitinence from meate, and doth prefently helpe

Medow hard Graffe, with manifold tufts.

Gramen Paniculatum arvorum. Corne Graffes with Panickles.

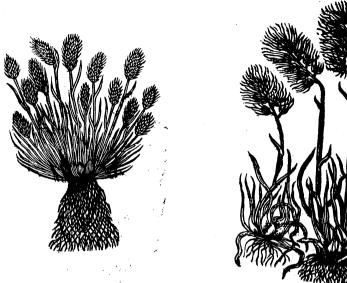

Henext fort of these Panickle Graffes to be entreated of are those that grow in the Corne fieldes, or those that have beene plowed, and doe lye Ley.

1. Grames arvense panscula crispa. Curled Panicke Grasse.
This Grasse hath descending from a threddy root, reddish scale bleads, and thence rise partow Grasse

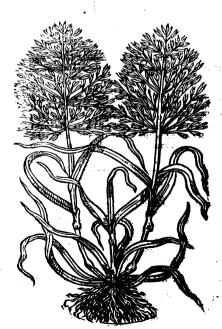

leaves, and low stalkes, bearing a head of many tusts, set one above and against another consisting of the unid reddish threds, issuing from a small buske. I have thought good to sudde the figure of that Graffe that Buske. menfis calleth Bulbojum Dalechampij, because Banbinm saith it is this, but net well expressed, but surely I Diskchamdubtit is another forc. 2. Gramen segesum panicala speciosa, The great Corne Graffe

lingoodly Graffe groweth up with a few long foft greene leaves, like to those of Millet, forme below, and omapon the tall (tiffe, round, fmooth, greene (talke, a yard and a halfe high, bearing a brave inflormer) per ad-deemany (lender (prigges, very like to the mited head of the Millet graffe, but more beautifull: the rootemimil raft of fibres.

1. Gramen b I ofum Dalechamoii. Corne or bulbed Panickle Graffe. I. Grames grutnfe panieula trifps.

The Vertues.

The Graffes, especially the purple spiked Medow kinde, is thought to come necre the properties of the other fel Galles, but because we have no certainty hereof, we leave it and them untill we can learne to what diseases thry may be most conducible.

CHAPA XIII.

Gramen spicatulus montaunus & nemorosum. Mountaine and Wood spiked Grasse.

He other forts of spiked Graffes, as I faid, were of those that grow on hills, and in Woods, which shall be here expressed. 1. Gramen mentanum spicatum Clusij. Clusim his mountained spiked Grasse.

From a long reoce, of a fingers thicknesse, parted sometimes into two or three stringes with many fibres thereat, and somewhat hairy at the toppe, shoote forth fundry heads of leaves each containing fricting somewhat long, thicke and halfe hollow like a gutter, very like unto those of the greater Thrift compoling one another at the bottome, a little bitter and sharpe in taste, from the middle of whom spring up stiffe fachion, from the middle of whom spring up stiffe fachion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion, from the middle of whom spring up stiffe fashion the stiffe fashion the stiffe fashion that the stiffe fashion the stiffe fashion that the stiffe fashion the stiffe fashion that the stiffe fashion the stiffe fashion the stiffe fashion the stiffe fashion that the stiffe fashion that the stiffe fashion the stiff fashion the stiffe fashion the stiff adofagreenish colour.

2. Gramen Spieatum anguftifolium montanum, Mountaine fpiked Graffe with narrow leaves. This Graffe differeth onely from the eight Graffe described in the last Chapter, in that it hath longer and much Brower leaves, flenderer stalkes and longer, and in the place of the growing, for it groweth onely upon hils and

somines, flowing and flourishing earlier then most of the other, namely in the middle or end of May.

3. Gramon fitvarian angustifolium spica alba. White spiked Wood-grasse.

The roote here of is yellowish growing allope in the ground, with small fibrea at it: the leaves which rise from

The roote hereof is yellowith growing allope in the ground, with small shreat it: the leaves which rise from that, are many but very short and narrow, scarse source or sive inches long, the stalkes of centimes exceede not the largest of the leaves, wherein stand small white spiked shead, scarce an metholong, be set with short haires.

4. Gramen Carpophyllenns spica, manistipies. Double spiked grasse with Gillostower leaves.

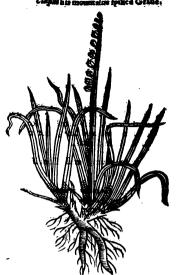

1. The largest composed of a bush of many reddish hairy sibres arise sundry short narrow leaves, sike unto those of Gillostowers, among which spring very many sleader stalkes, naked without joynts or leaves, scarse growing dest the leaves, sustaining very short reddish spikes many set to gether.

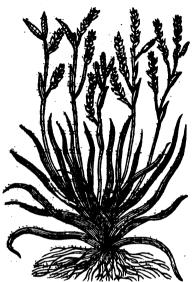

5. Gramen Carpophyllenns spica varia. Variable spiked grasse.

The blacke rootes hereof are small long and threaddy, bushing thicke together, from whence spring long and many leaves, like those of Gillostowers among which grow study small naked stalkes, bearing: a slender long hall head, sometimes single, and sometimes divided or branched into several long parts, made of many lakes.

This graffe bath many thicke firme or fleshy long and pointed leaves, lying in a round compasse, at the head of beroot, like to those of Gillosowers, not having any nerves or vaines to be seenom them s' none hash as yet essent to the for Gillosowers, not having any nerves or vaines to be seenom them's none hash as yet essent to be or bead, what forme it beareth, but it may be Bankium hath seene it, in that he placeth it with the some of spiked Grasses.

1. Gramen Mentenen Spicetom Chilis. Clafin his mountaine follied Grafie.

7. Gramen files genius Celumna.

2. Gramen spice untante longissime. A long spiled Graffe with a bending toppe, or Capons saile Graffe

brownish corned head. 8. Gramen spica nutante longissima.

7. Gramen Spica gemina Co

ble spiked Graffe.

A long spiked Graffe with a bending top,or Capons taile graffe.

From among many long and narrow graffie-leaves, which by time & age, grow fomewhat rounder, arifeth a flender ftalke, about two foote high, with two or three finall leaves at joynes up to the top, where thandeth a very long spike, ben-ding a kinde downewards; composed of small and hai-

sy milts, which grow grayith being ripe, with finell which feeds within them, the roote is fibrous and firings.

The Phoater of Plants.

g. Gramen frice Attichlate Urgibilate. A goodly Firginia graffe with a joynted fpike.

This goodly Virginia graffe groweth great, with thinry faire large and broad Graffelike leaves, very fmall pointed formwhat hard in handling, the falke is fortherwhat internal pointed for first party, each of them almost halfe as intil speece, being almost round, yet a little flat: the roote is as of the first party. lany and liveth long.

the Place and Times.

The Names.

The first of these is so called by Cluffor as it is in the title, who saith he found it or the like, on the Sea coasts of flairs, Gerardhath it by the name of Gramen maritimum alternm. The fecond, third, fourth and fifth, are men-Fladers, Gerard natu it by the name of Grames maritimes alterum. The fecond, third, fourth and fifth, are menind onely by Bashimse by the fame titles they beare here flaving that whereas the initialeth some of them by the same of Caryophyllam, and as I thinke lesse a meninguous, for Caryophyllas berbs different much from Garyophyllis, to the leaves whereof, and not unto Caryophyllas, these Graffes have resemblance: The first is called by Gastar in borth Games Apisana Rabiques quast professions, the Graffes have resemblance: and Lavisian. The seventh is called by Columna Grames Nouveloops, and by Bashimas, Grames specimes, Collaboration in the Caryophyllis specifically the collection of the second of the second specific of Master Goodiers invention: The last came from Virginia, all Master Isla Tradition the Younger brought it from thence also, with a number of other seedes and rare

We have no evidence what properties these Graffes have in Phylicke, but are onely left as food for Cattle, but the first but the naturalis of those places where it groweth, to be most fingular to cause Cattle to give abudance of milke. and controlled to the controlled

CRAP. XIV.

Phalaris. Canary Graffe.

Fithis Graffe there are three speciall varieties to be declared in this Chapter, but there are divers other baltard forts which shallbe shewed in the next-

1. Phalaris vulgaris. Common Canary grafic. The common Canary graffe is but an annual plant, to be new fowne every years with us, by them the will fee it grow, bearing joyneed fieldes halfe a yard high, with graffie leaves on them like Barley, and the tope a round chaffie head. Somewhat pointed above, whole bloomings are yellowide, wherein lye flat round thing feels, bigger then Miller and life then Linfeede, of a yellowide life then Linfeede.

ing fede, bigger then Millet and liftle then Lineeric, or a yellowish colour: and form wisher like to the feed of Sofamone: the mote is fibrous dying every Winter with us.

2. Pholowis femiles nigro.

Canary graffe with a blackish fielde.

This other Pholoris different not from the former, but in big somewhat lesses different not from the former, but in big somewhat lesses both in stalk losses, and head, and chiefelyin the seed of the big sormer.

3. Pholoris but both femiles also.

White bulbed Canary graffe.

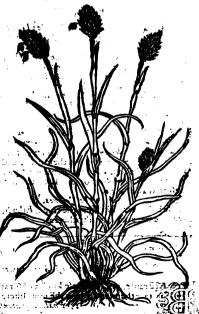

This Graffe also groweth very like the former, but with smaller and regrand these feight cettains allow.

This Graffe also groweth very like the former, but with smaller and regrand these feight cettains, and leaves on them and the roote more fost and gentle, the spiked heads are insilter and a little losses, and not fully so close growing together, foster also in handling, and bringing smaller, but whit in scale is them then the former: the rootes are many small white bulbes, growing in tusts together with long shores, desirable the regret with long fibres, desirable thereby they are fastened strongly in the yound and dye with every yeare as the others doe, but encored into great tusts. crafe into great tufes.

The Place and Time.

Allthese forts have beene found growing in Spaine, and hought us by Bool, with some ballard forts, and many other tings: The first hash beene of many years knowledge, and bushe. us. from the Canary llands with those finall securing birds, which wee call Carary Birds, whose took these seeds are. Loss faith it groweth also in Province of France. Bashinsus faith that the ferond came out of Make, where those birdes feed on it. They all are ripe with us in August 760 Names.

The Vertues.

The chiefest use that these grasses are put unto, is for Gentlewomen to weare on their heads or arme, as they would doe any fine flower or pretty toy to behold, as also put into wreathes and Garlands, that the County people make for their sports and pastimes, And hath no use in Physicke for any Medicine that I can heare of

CHAP. XVII.

Alopecuros. Foxtaile graffe.

S I handled the Phalaris, fo will I the Alopecuros. that is speake of the genuine kind in this Chapter, and joyne unto it fuch as are likest thereunto, and speake of the baltard kinds in the Chapter following.

> I. Alopecuros genuina, The true Foxe-taile graffe.

The true Foxe-taile graffe groweth up with two or three foft hoary stalks about a foote high, with small long, and parrow foft leaves on them, as honey as the stalks, whereon Rand foft woolly, or hoary heads, fornewhat long and round; befet round with foft haires, of a pale straw colour, resembling the taile of a Foxe, whereof it tooke the name: the roote is small, and made of a few fibres which peritherh yearsly

2. Alopecuros altera Anglica, & Flaudrica. Another Foxe-taile graffe like unto the former.

This other Foxe-taile grafile hath leaves and rootes not much unlike to the former but longer. and the stalkes grown higher, the heads also are rounder, and shorter, and nothing to woolly or hoary.

3. Alopecaros maxima Anglica

The greatest English Foxeralle graffe.

This greatest Foxe-taile graffe groweth to be halfe a yard or two toote high, sometimes having faire large leaves like unto Wheate but larger, fet at the joynts, and at the toppes, large great, full foft and woolly heads like the former, but much greater and longer, either higher or lower.

The Place and Time.

The first of these is not found naturall in England, as the others are, but groweth in diverse places about Mompelier in France, we onely have it in our gardens for curiofity.

1,2-3. Alopecures genuins. Maxima ey alters deglice.
The three forts of Foxe-taile Graffes.

Constant Commence The Names Lis cilled in Greeke Moniere Michellen and fo in Namer.

Lis cilled in Greeke Moniere Michellen which is Cauda vulps, and so they call it at Monplier as Libel saith; of the County to call it suspine Stelephards, Lugdinensis calleth in gramen tomensolum Aloparent vera Pling & Thropherassi. The second Lobel calleth as it is in the title, because he found it in England as and services of the West parts of this services alled it alopecuros maxima Angle Britannica, and hath not mowne to the before. The Vertues isho fixed all property found to be in any of these for Medicine, but to be worne onely as a toy, in mens CHAP. XVIII.

Granien Alopecurodes. Baltard Foxe raile graffe.

Here are livers forts of these wilde or bastard Foxe-taile grasses, some greater, other lesser, all which a meane to comprehend in one Chapter, seeing they are of no great moment, and but to content the fearer of the greater first, and the lesser after them

1. Grassen Alopeanoides major. The greater bastard Foxe-taile grasse.

The greater of these wild Grasses ries major. The greater bastard Foxe-taile grasse.

In grassen Alopeanoides major, resembling the former, but not so soft or Woolly-like the spite is somewhat great and long, resembling the former, but not so soft or Woolly-like the spite state of the spite spite spite spite.

CHAP. XXII.

Gramen Caninum bulbofum & nodofum. Bulbed and knobbed Quich graffe.

Meothie Rinde of Doge graffe, isto be joyned fome other graffes, whole rootes are knobbed or bulbed, yerthatifort which Bubbinus maketh mention of in his Prodromus, growing in the water, I will referre to the next Claffis, whereunto it is proper.

T. Gramen Caninum bulbofirm nodofum vulgare. Common bulbed and knobbed Quich graffe. This kinds of Quich graffe hath for his rootes, three or foure, or more round white knobs or bubes, one set upon the head of another, with divers fibres underneath them, from the uppermost of whom fringeth forth diversiong hard graffie leaves, fharpe at the edges, 'and in the 'middle of them a joynted stalke, spingen forth diversiong many grante leaves, that he are the edges, and along panickle, foread into many parts like with three of four furth like leaves upon them, at the toppe whereof is a long panickle, foread into many parts like with the foreast of the long little in any Redofum, whereof Oates, whereunto fome have compared it. Lobel exhibites in another fore hereof differing little in any Redofum, pur, but the root, a which are small and round; and set at diffances all along the rootes, and as sweet as the o-

This small Graffe hath a small whirish round knob or balbe for the roote, with small fibresunder it, shooting forth from the beard thereof another, formewhat like unto a bulbe, but much finaller, and like a flender knob, with shall joynted stalke above it, and a long narrow pointed leafe at each of them being foure or five inches long, adathe toppe one short foft spiked head formewhat like unto the head of the Cats saile graff.

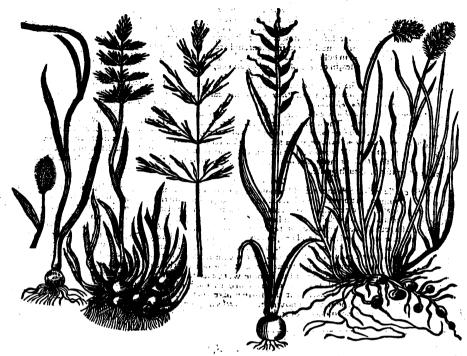

Thirdouble bulbed Graffe, hath a greater round tweere bulbed roote below, covered with a reddish skinne, adone like a leffer at the head thereof, the uptight flatke is not a foote high, joynted and kneed, like unto a Where straw, having source or five narrow grass-like leaves on them, and at the head thereof a small long panickle made of diverse huskes, each standing by it selfe, like the huske of an Oate, one of which appeareth small reddish bloomings.

4. Gramen bulbofum Alepinum: Diffhe bulbed grafie of Aleppo. This Alepps graffe liath's firme white round sootey covered over with a netted outer skinne, and small white interunderneath, from the midft whereof come forthirtye of three fireked finikes, above a foote high, and with Many graffic leaves for on them; the spike is somewhat like to the Wall Barley, breaking our of a broade lease whose point riseth above it.

Hhbbb 2

5. Gramers

1,2. Gramen Caninum balbefum vulgare es common knobbed Quich graffe. And another with a small round spike,

5. Gramen bulbosum Messavense. The Sicilian bulbed Grasse.

Let me adde this plant here, for I know no fitter place to infert it, although it be not answerable to the rul. whose description is thus. The roote is very small and round somewhat like many a wilde. Saffron roote, and of the table of a Chefnut, having onely two or three long leaves, as finall as haires, with fome thater on the falle on the toppe whereof groweth a finall long and round knob or bulbe, of the bignetic of an ordinary beane, fone-what yellow or browne on the outlide, and having three rough circles about it, equally diffar one from mother, but white within, and of the substance of a Chesnut.

The Place and Time.

The first groweth not so common with us as the creeping rooted Grasse, yet sufficient plentifull in many plowed fieldes in the Land. The second necre Basses. The third in Spaine. The south necre Alaps in Syria. The last both nere Verona and Italy, and at Drepannen, and Messans in Sicilia. The Names.

The first is called Gramen nodosum avenacea pluma by Bauhinus, who also doubteth whether it may not bethe Egilops Pliny, which hath a kinde of bulbe; other scall it Gramen bulbefrem, suberafam, or nodofam : The fecond is mentioned onely by Bankinnu in his Prodromus and Pinax, by the fame title it hath. The third is the second Grames node sum budgism by Bankinus, and the Lein Lagrous in Lugdonensis, who tooke it to be the Coinc of Theophrashus, it. 8.c., 16. Casalpinus saith it is called by the common people in Italy, Perlare, and Oryza sylvestris. The last intentioned by Inhannes Baptistic Corression in Miscalaneous medicinalism specase quinta, Salacob. where her sigh that it is called Bafy li by the Sicilians, that usually fell it in the Markets, and by some others there where it growth, Cast ancalor, from the sweete taste like Chesauts, that both room and heades have in eating, Montagnas also, as he there saith, mentioneth this roote, and that they of Versus call it Eutrofium, or Aculium.

The Vertices,

The first knobbed Quich-graffe is found by corraine experience not onely with us, but in Savey, General to have in classification of the corresponding to the contract of the corresponding to the correspon where it plentifully groweth, and is used to be more effectuall to provoke urine and to breake the stone, to case those torments of the belly, that come by loolenesse, crudities of humours, and obstructions, and generally is beid fafely to be used in any the like causes that the other is, and with as good successe: The third Mycona faith hee could understand of no physicall use, it was put unto, but that Hares were much delighted to rest by it and to digge up and eate the rootes: the last is used for food being windy withall that is not used Physically.

drage :

CHAP. XXIII.

Gramen geniculatum. Kneed Graffe.

F that kinde of graffe that groweth in the uplands there is onely a greater and a leffer as that bee thewed in this Chapter, but there are others growing in the waters, and neare the Sea fide, which shall be declared in their proper places.

1. Gramen geniculatum majus. The greater Kneed Graffe.

The greater of these grasses hath many long trayling branches upon the ground, with sundry great into on them, and shooting out ficres from those joynes that lye next the ground, so that it doth sometimes run reguie foote in length, with one long leafe at each joynt, small at the end but broadest below, from which as

will are the toppe come forth divers small long spikes of chaffie huskes of an overworve colour, which basind joynes are to full of a molt pleasant juice that it seedeth Cattle much more than any other Hay, and the those those Farmers that have it growing in their grounds, doc keepe the Hay thereof for their chiefe winmovilion, and in flead of Provinder; the roote is bushing and fibrous.

2. Gramen geniculatum minus. The leffer Kneed Graffe. Throttler kneed graffe creepeth not fo much on the ground as the former, but fpreadeth more upright with tabulate, whose joynes are not altogether so great as the other, the stalkes send forth spiked heads at the tops, before what larger then the former, and of a sadder overworne colour: the roote is threddy like the precedent. The Place and Time.

They both grow in most medowes in fundry places of this Land, but have beene especially observed, the greatingrow about Wilton, in a great medow lying among the bridges at the townes end, belonging to the Eatle of minute, and the other at Wa minster, both of them in Wilishire;

The Names. Parliam as not well knowing these referreth the former fort to the kinder of Gramen datifylon, or Ischemon, tonic of the divers Panicles it beareth together in a tuft, and calleth it Aquations as Tabermontants and Gerard Estat both mistooke it for that other which groweth in waters in our Land as well as others: they have their both on the great joynts or knees on their stalkes.

The Vertues. We have not knowne these used to any other purpose then is formerly declared,

Hhhhh 3

CHAP. XXIV.

Gramen Daltyleides five Ifchamen. Dew Graffe, or Cockes foote Graffe.

Athough formerly there was but one fort of Ischemen knowne, yet fince for the likenesse of the micles or tufts thereof, there are divers others referred effecteum o as freies thereof.

is of cults thereof, there are givers officers referred the common Cockes foote Graffe.

1. If chemon fylve fire latine fifth. Common Cockes foote Graffe.

The common Cockes foote graffe hath fundry effects reddiff joynted stakes with faire graffy keeps. on them formewhat dented on the edges, broad at the bottome and fmall to the end, of an harfn or binding tile. on them formewhat deners on the edges, or oan at the contours aim the series of a brownish colour when they are night the roote is made of many fibres.

2. Ischemon stveftre spicie villosis. Another Cockes foote grasse.

This other graffe hath purplish stalkes, a cubit high, with fewer and much narrower leaves on them, the spiked heads are more in number then the former, and more hairy, having as it were short yellow beards for on both sides of the panicles, wherein lye the seede: the roote is bushie like the other.

Ischemon sativum sive Gramen Manne esculentum. Dew Graffe.

The Dew graffe hath likewife faire joynted purplish stalkes, and larger graffie or reede like leaves on them. fomewhat hairy or wolly at the bottome of them, and about the joynte at the toppes of the stalker stand larger foikes or panicles, and more also set together, made of many small chaffie buskes, with long white seeds in them, somewhat greater then Millet, and lesser then Rice, standing all as it were on the one side the reouris greater and more bufhy, whose plante differeth from the former no otherwise almost then a managed from the wilde plant.

4. Gramen Scoparium Ischami panienlis. Brufh Graffe.

The brush graffe hath a rocte confishing of many very long hard threds or fibres, a cubic long or more (whereof are made in France where it is naturall those brushes that wee doe usually brush our heads, &c. withall) the falkes are hard, flender and joynted, about a cubit high, with fmall long leaves on them like unto the fecond fort of Ischemon here before fer forth but sweeter in talke, at the toppes of the stalkes stand five or fix or more bright long panicles, like unto the Cockes soote but larger, flatter and lesse demed.

5. Grames Canarism Ischamis passiculus. Cockes soote like Quich Grasse.

The Cockes soote like Quich grasse might as well have beene numbred sations the Quich grasses as among thef; being as it were indifferent betweene them both; it hath running joynted rootes like the ordinary Ouich praffe, and so both stalkes and leaves some what resemble it, but the head is dispersed or spread into such like sender long panicles as the Cockes foote graffe, the small chaffie huskes whereof conteine rougher seede.

> I. Ifchemon (plueffre latiore folio. mmon Cockes foore Graffe

3. Ifbanton fativitus frue Gramen Mansa efculentun: Dew Graffe,

6. Granes

6. Gramen Daltylon repens

Creeping Cockes foote Graffe.
This small graffe fendeth forth from a sparsed thready
not many long slender and weake branches, trayling or orging upon the ground, and shooting forth roots at the ions, the leaves that grow at the joynts are final and pulishing and narrow, and at the toppes of the stalkes which rife not much above a spanne high, foure or five fall sender blackish spikes within the huskes whereof hethe feede.

7. Gramen Daltylon Egyptiacum. Egyptian Cockes foote Graffe.

The roote of this Egyptian Graffe doth fomewhat accounder ground like unto Quich graffe, but much kik, the leaves are very small, for upon small stalkes of whand breadth long, having foure finall long panicles fet utheir tops and no more, opposite one to another like a doffe with imall feede inthem.

This is Alpinus his figure and description, but Journes Minim Mindense a Chirurgion having lived long in Enwhath fet out some notes upon Alpinas his Egyptian part, and among others giveth as a little differing fi-gar, with the toppe pannicles distributed into five or fix pate refembling a starre, and therefore calleth it fellatum, on of the soppes whereof I have shought good to joyne to the other that the difference betweene them may be

> 8. Gramen Dallylon Africanum Cockes foote Graffe of Africa.

This graffe of Africe is in most things like unto the last, by gowing a little higher, the leaves are as finall, and the spikes or panicles somewhat longer and bigger, more mented or fet as it were with graines: the root ercepeth about as the last and abideth extremitie of our winters.

The Place and Time.

The two first are usually found manufall in divers places of Hely, and Narbone in France, as also in divers places

Gramen Dallylon Egyptiatam. Creeping Cockes foote Graffe.

of our owne Land, but he third is usually sowen as Corne is in their fields in many places in Germens, yet it in sayd to be naturall in Italy: the fourth in the Lie which is not farre from Orleannes a the fift is sound in Space and Narbone in France, and so is the fixt also, and is there the most common: the two last are knowneby their titles; they all keepe the same time that the others doe.

It is called in Greeke I & 400, and so likewise Ischemon in Latin, it is allegraken to be Latinia pling by Angular, and called Sall crus Apulei by him also, and Gramen Ischemon by all other outbook overly Leanierus was deterved in taking it to be Coronopus, because the Sclavossans called it Cornis per Bashings and Takerman was deterly make mention of the second a the third is called generally Gramen Manne, and some addectionament extits of so much use among the Germanes, yet Thalism and some others call it Gramen acadeatum. Cords upon Dioscovides also calleth it Frameanum Germanicum Schoolen Organ species who Isalism call both this and the fist Sanguinaria, Sanguinaria, Sanguinaria, Sanguinaria, Sanguinaria and Capriola: the sourth Lobel calleth Gramen Scoparium Ischemi passiculus at it is indetitle: the fist Lobel formerly called Gramen Canarium alterum, but after wards Gramen Canarium Ischemi passiculus, Lugdunensi: Gramen vulgare Dalechampi as Banbinum saith, but I thinke he is mislaken, set I canoc such so. others call it Gramen as it it were the sint of Dioscovides, and so Clussus also taken it to be, calling it Gramen legisimum: the fixt is called by Lugdunensis, Gramen vulgare Dalesbampy as Banbinum south it tusy but not so in the other at the seaventh Proper Alpunus hath made memica of in his booke of Egyptian plants, and said that the Egyptians call it Neisemelmsalo or Gramen crucis: The last is not remembred by any before, and therefore this title is sufficient for it. They may be all called Gramen Daelylon or Daelylosies, as Banbinum dock from beforme of the pannickles, representing spread singers, and thereupon might as well bee called in Englis Finger Grasse.

Cockes foote grasse bruised and layd ro any place that bleedeth, doth stay the blood presently, whether from the nose or wound, yet if the rough spike be put into the nose and rabbed it will make it bleeds thus the divers manner of using it workes a contrary effect, both to draw blood and to stay it: being boyled with Axangia, that is, so suct and some houshould bread doth quickly heale the biting of a mad dogge: the same also applyed to hardmore stisses to be bleare eyed, or else being bound to the necke in the beginning of the sayd disease, doth quickly discusse the same also applyed to the same to lock red & to be bleare eyed, or else being bound to the necke in the beginning of the sayd disease, doth quickly discusses the same also applyed to the same also apply

CHAP. XXV.

Gramen Arundinaceum. Reede graffe.

Of the Reede graffes there are divers forts, fonce grow on the land and others in the water, those that grow in the Vp-land grounds, shall be entreated of in this Chapter, and the other bereafter.

1. Calamogrofis five, Gramen Arandinaceam major. The greater Reede graffe.

The greater Reede graffe rifeth up with many joynted stalkes and large sharpe cutting leaves on them like to those of the water Reede, but lesser: the toppes of the stalkes are furnished with divers hard long spikes or heades, somewhat like the common Reede, which when they have stood long doe open, and having a flocky substance in them are carryed away with the wind the root is full of white strings, and some joynted ones, which spread in the ground. There is a lesser for thereof, whose toppe is not so full of spikes, as

having but one or two thereon.

2. Calamografis altera Norwegica. Reedegrafie of Norway.

This other Reedegrafie of Norway groweth not so great but harder and rougher, both in stalkes and leaves then the former: the tpoky tust at the toppe is larger, more spread into severall panickles, sharper also and rougher in handling: the rootes hereof like wise consist of many long strings. We have one like hereunto, growing nege Hackney, it is be not the same (our milder Country altering the roughmesse) saving that this bash a tust of hair type threeds growing at the head of the roote.

This Reede graffe is in ftalke and leaves fomewhat like the next woolly Reede graffe, but the flalkes are joynted in two or three places, two or three cubits high, with narrower leaves the sper and almost two tubits long, and a little ftriped withall: the coppe pannickles are fometimes a foote or more long, parted into many king spikes, which are soft as slike, and of a shining over-worne murrey colour: the roote is white with thicke shings, which spread in the ground sometimes.

4. Calamografia

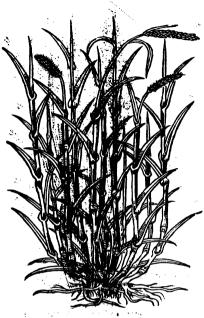

2. Calamogroffis eltera Norwegica. Reede grafte of Norway.

2. Graines Armedinaceum minus The leffer Reede grafie,

3. Calamogroffis filue Di Joennis.
Reede graffe of Saint tobus Wood.

Minus.

Anglica.

CHAP. 26.

4. Calamogroftis sive Gramen termentesmi The foft or Woolly Reede graffe.

This woolly Reede graffe, is in the roughnes, dryneffe, and forme of the leaves, not much anlike to that fort of Foretaile graffe before spoken of in the Chapter of Foxetailes, which they for Mompelier called Pleislofthenanthum, but much greater, and not woolly as some related them: the stalkes likewise being two or three cubits high, and with few joynts are rough, bearing large spiked heads, set all along a panickle, reddish for some time, but growing to ripenesse of a thining filver like whitenesse, and as foft as wooll in handling, from whence it tooke the name, the roote is form what hard and rough at the toppe, with divers long fibres is uning and the rough at the toppe, with divers long fibres is uning from it. This description is according to the Dates copy, translated by Love immelle.

S. Calamografia toro a passicula.

Round tutted Reede grafic.

This fort of Reeder graffe bath narrow long leaves fornewhat fofter and gentler in handling then the others before yet not caten by any cattle : the tuffor panickle it felfe is more round, and thicker, with filderer heads, fer close to-gether like fmall knots of knobs, but formewhat flat on one fide, the bloomings hereof are of a yellowish purple colours fome panickles likes wife are found to be more long and narrow the rootes are fmall and firing y.

6. Calamogroffic moutana errodic five Scirpm Trait.
The greater Mountaine Reede graffe.

Tribe 13.

6. Calamograft's montana enodic five Scirpm prime Tragi. The greater Mountaine Reede graffe.

This greater mountaine Reede graffe groweth up with fivorg Italkes, as high as a man, without any joynts on sear the most, having thereat fort, and not hard long leaves: at the toppes whereof are many long that dashe spikes, set more spariedly then the others, each whereof is of a bright reeddish yellow colour, and set up right. Another fort hereof is much lower and smaller, the spikes being smaller and shorter, and not stream, of a darke red colour: the roote is somewhat hard, but with divers fibres thereat. "The Place and Time.

the fift fort, both the greater and the leffer grow in most Medowes that are findy, rather barren then fertile. Second and third are expressed in their titles. The fourth in the borders of dry fields, and by the hedge sides is a countries of this Kingdome, especially in Dorfes like. The fifth also in the like places. The last groweth is most Woods that are on bills and mountaines: they flourish in the Summer time, and their stalkes perish The 28 ames.

The Greekes call it water yours, Calamogroff is also and Gramon Arundinaceum in Latine, Lobel calleth the first claumin price Babylonicum, and Baubinus Gramon arundinaceum price multiplici. The second is not remember in the force Lobel noted it in Norway, when he were into those parts with the Lord Zanche Ambassadour. The third loss to be knowned by the title: The Sourth is called by Lobel, Gramon tomantosum Calamogroft is quo-Land walf Gramen plumofum, extant in his Dutch Booke, and it may be is that Gramen arundinaceum piumopublishis Banhinu describeth for the 44. in his Prodremme, or very like it. The fifth also is not remembred by my about before. The firth of both forthe is called by Tragms, Scippi prime of alternam genus, and is thought be the lawn Lychnanthemos of Thalism, and by Bauhinus, Gramen arundinaceum enode montanum. The Vertues

Ihreinme of these Graffes serviceable for any Physicall use that we know, neither doe any Cattle feede throughy reason of their hard and sharpe cutting leaves except the sixt, and that but seldome neither: the stalkes dissolution are platted into mats, for Country women to lay and dry their new preffed cheefes on, and for o-

CHAP. XXVI.

Gramen Nemerofum glabrum. Smooth Wood Graffe.

Here are two kindes of Wood graffes, the one with smooth leaves, whose sorts shall be entreated for this Chapter, and the other with rough or hairy leaves, in the Chapter following.

1. Gramen nemorosum capillaceum panicala alba. White tusted Wood graffe.

This small grasse growerts thicke and close together in a tuft having a number of greene leaves rifing from the roote, being as small as haires, and of a foote long, the stalkes rise up among them a cu-

Gramen nemorosum majus spica rnfescente.
The greater browne Wood graffe.

4. Gramen nemornm exile durum. Small hard wood graffe.

bit or more high, smooth and bare almost without joynt or leafe on them, the toppes whereof end in a skrider white panickle, not an hand breadth long, composed of small huskes set with beardes: the roote is small and

threddy.

2. Gramen nemore sum majus pica rufescenne. The greater browne Wood graffe,

The greater Wood graffe hath a number of narrow graffie leaves springing from the roote, among which come forth many smooth round stalkes, without any joynt or lease on them, at the toppes whereof stand loos smooth brownish spiked heads, seperated a little one from another, and as it were a little bearded: the roote is a bush of many fmall fibres or ftringes.

3. Gramen nemoro/um minue. The leffer Wood graffe.

3. Gramen nemorofuse minus. The lefter Wood grafte.

The lefter fort differeth not from the greater, but that it is in all parts lefter and lower, the small chaffie teared eares being smaller and nothing so soft, but rather hard and a little more sparse.

4. Gramen nemorofuse exile durium. Small hard Wood graffe.

This small graffe hath divers small hard leaves a span and a halfelong, the stakes are slender, with very sew joynts and leaves on them, at which joynts, and at the toppes also come forth small long chaffie spiked beades. The Place and Time.

These according to their titles doe grow in Woods frequent enough in our owne Land in divers places, Banking 1 nere according to their titles doe grow in vy oods request enough in sail owner land, in divers pate, Bakki2016 faith the first groweth plentifully in an Oaken wood not faire from Michel field in Swiferland, and flowrish when others doe.

The Names. These have their names in their titles, being called Nemerofum or fitvaticum by all Authoris that have writen

The Vertues. These Grasses are not used in Physicke, nor are they any good fodder for cattle, but are utterly neglected both by man and beaft.

CMAP. XXVII.

Gramen nemorum birfutum. Hairy Wood Graffe.

this kinde of hairy Wood graffe, there are some more forts then of the precedent, as shall be prefently shewed.

It is greater wood graffe hath divers long and somewhat broad leased hairy wood griffe.

This greater wood graffe hath divers long and somewhat broad leaves turning downswards, rights are the sound leaves turning downswards. fing from the roote, smaller to the end, grayish underneath and greene above, set about the edges with which

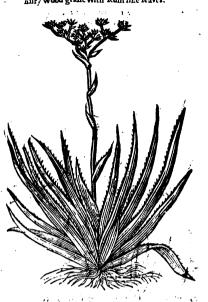

Gramen remorum hirfutum majue. I he greater hairy wood gratie.

2. Gramen westornes birfatum majus alterum pretta tuber of a radice. A greater carely havy wood graffe with a knobbed rootes

3. Gramen nemorum hirfutum latifolium minus jancea panicula. The leffer broad leafed hair, Wood graffe with Rush like leaves.

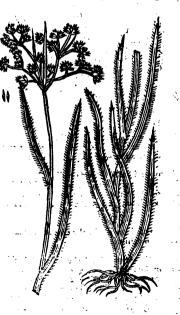

Gramenbly futum anguftifoliummajus alterum. Another fort of narrow leafed hairy graffe.

4. Gramen nemorum bi futum majus angustifeltum.
The greater narrow leafed hary Wood graffe.

6. Gramen nemorum hirfutum minus angustif liam. The leffer narrow leafed hairy Wood graffe,

imall long haires, the stalke from among them groweth to be two foote high, with leaves at the joynts, and fer at the toppe with divers small greenish flowers in little huskes which contains small feede when it is ripe; the roote is a tuft of many small long threds.

2. Gramen nemorum hirfutum majus alterum pracor tuberofa radice. A greater early Wood graffe with a knobbed roote-

This earely Wood graffe hath larger leaves then the former, of a deeper greene colour and as hairy allo, on the Halkes are leaves at the joyntes, as in the other, and fuch like heads or knaps of flowers, the roote is thicke, jone. what there and browne, almost like a Tormentill roote, with a number of small brownish haires covering it yer

3, Gramen nemorum birfutum latifolium minus juncea panicula. The leffer broad leafed hairy Wood graffe with Rush like panickles.

This lesser Wood grasse is very like in the growing unto the first or broader fort, but that the leaves hereof are narro wer and the panickle or tuited head, at the toppe of the small stalles, is smaller and somewhat resembling the 9. Gramen birfutum capitulo globofo. Globe headed hairy Wood groffe. toppes of Rushes.

4. Gramen nemoram hirfutum majus angustifolium.

The greater harrow leafed hairy Wood graffe, The greater narrow leafed Wood graffe, is very like in the manner of growing unto the first fort of Wood graffes, but that the leaves are much narrower, therter, and turning downewards as the first, the stake is bare without joynt of leafe, having at the sop three small rough and almost round scaly heads fet together: the roote is small and long with fmall fibres fet thereat.

5. Gramen hir sutum angustifolium majus alterum

Another fort of narrow leafed hairy graffe. From a small reddish fibrous roots riseth up a stalke necre two foote high, and fmooth, usually bearing at the toppe a fort white panickle, some what spread, and made of sundry finall scales as it were, in every one whereof lyeth a small round blackish seede: the leaves are few a little hairy and fome of them compassing the stalke: the whole panickle hath two small leaves set at the bottome thereof, the one nath two imail leaves fet at the bottome thereof, the one rising higher then it, the other lower; this faith Banbinus, groweth in the moilt fieldes of Michelfeld by Baffil.

6. Gramon nemeram his latum minus angustifelium.

The lesser narrowleased hairy Wood grasse.

This leffer Wood graffe is leffer then the last fort, having many long and narrow leaves growing at the roote, as hairy as any before, the stalke hath two or three joynts, and short leaves on them, and at the toppe divers small heads standing upright, each standing on a small hairy footestalke; the roote is somewhat long, like a Cyperus roote with a bush of small long threds.

7. Gramen nemorum hirfutum minimum.
The least hairy Wood grasse.

The least hairy Wood graffe bath more store of narrow long hairy leaves then the last but elle in all things it agreeeth with the fixt in heads and flowers, but being whiter then

8. Gramm bir fueuto five exile ferrugineum. Small hairy browne Wood graffe. This Wood graffe is as fmall as the laft, but with leffer flore of leaves, the heads on the stalkes that are not above foure or five inches high, are Woolly and too fully round but a little flat and of a yellowish browns colour, the roote is finall and fibrous.

9. Gramen hirfuram capitulis globofis. Globe hended hairy Wood rieffe. This Wood graffe hash long figures as broad as the third fort here before, with fome small fost haire about the edges, the stalkes are about a society, with joynts and leaves on them, the toppes being surnished with two or three cound fof: whire weetla trade, composed of many small filver like threds : the roote is small and thred-

The Place and Time.

All thefe grow in Woods, while about High gate, and other places, and flowrish in the end of Summer, except the second, which is earlier thereany of the rest by a moneth or two sometimes.

The Names. The first is called by Labeland others, Gramen birfutum nemorofum, Baubinun giveth the figure of the third, and of the fifth, but I have thereand added alterna to diftinguish it from the fourth, being of later invention: The or the atth, out a nave thereunen anden asserting to alternate to the strom the routh, being or later invention. fix is called Coperilla Could's Softwar in hortisand Gramen exile hir fundamen Coperiodes by Lobel, Gramen semistra Dalechampy by Lingdonness; said Gramen hir future can horning. Schonogroffis five Gramen Indiann. Rush Graffes.

Here are divers forts of and araffes. Some that grow in the upland grounds, some in the watery and

This gallant Both Graffe hath a great many fast flender fund flakes, eight or nichte her aucht or halfe abende were her and form among whom rifeth up two of the flender fund flakes, eight or nichte her aucht or halfe abende below and frank ber aucht or halfe abende below and frank ber aucht or halfe abende below and frank ber aucht or halfe abende below and frank bearing at their popes out from betweene two kaves which are rather like wire.

This small Rush Grasse is very like the former, but that it that unth smaller restrike to roste from smong four inches long, rising out of the browner had make or hole, for at the toppe of a least should find on the wipe like with the like there, and a small find on the wipe like wind which spring up divers joyness (talks with fach like there, and a small fine of the wipe like wind the former, but of a browners had charge on the many in the like the whole, plant the having two input serve the cast as in the former.

There are as in the former.

Dalechampins his finall Buth graffethate groweth in did by place, but the greene leaves rifing from a very long white fibrous roote; whence foring idivers joyned stalkes with some sew leaves on them, and at the toppe a sparked or open spiked head somewhat like unto the Holestone Salamannum of Clusius consisting of many purplish hunders.

Clusius confilling of many purplish husics.

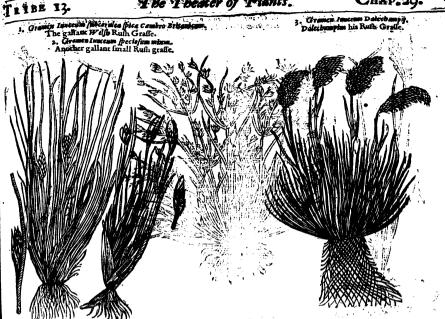

4. Gramen Inncessor vinleare. The roomston Rush graffe.

The leaves of this common Rush graffe are almost round. Even of eight inches long, among which the stakes are a span long, beare at their heads several small papicing the fashion one above another a the roote is com-

posed of brownish yellow threas.

5. Gramen Inncents flygarum major exticulars falls. The greater joynted wood Rush Grasse.

The stalkes of this Rush grasse are sometimental and very pittens, the leaves are almost round with many serial crosse joynts on them; the susted began arthotoppe of the stakes that are neare two cubits high are much spread into many rush-like pannickles and somewhat slat also, the roote creepeth a little set with many start the start of the star 6. Grame fmall fibres.

Gramen lunceum flust icum faifa panicula. The greater joynted wood Ruth Graf

6. Gramen Innceum fylvarum minus articulato felic A leffer joynted wood Ruth Graffe.

6. Gramen Iunceum sylvarum minus articulato folis. A leffer joynted wood Rush Graffe. The divers stalkes of this Grasse that rise from the hard spreading roote with many fibres thereat doe take roote the in the ground and beare fuch like joynted leaves, and imall pread painfield heads above, very like unto held but finaller by the halfe in each. And there is a fmaller also whose leaves are long and stender, but not wism. logated, the pannickle whereof is smaller also but sparsed in like manner.

7. Gramen Iuncoides Iunci fpar a panicula. Rush Graffe with rush-like sparsed heads. The falkes hereof are flender, somewhat flat and almost two foote high, the leaves are smaller then the common fortabout two spans long; the toppes likewise are smaller and spread with whitish heads a the roote is ydlowith, spreading it selfe with long tibres. Iiiii 2

e di il

7. Gramen immeridardunes franfa paningla. Ruth Graffeimich rathe iske sparted lowes.

8. Gramen funceum perum five Holofium Martholi, Tole Graffe

9. Gramen mantennen Imcenm capite formefe Mibuttaling Kinft Graffe with tellybrads.

8. Gramen Iunceum parvum feve Holoftium Matthielt & Gramen bufonie Flandrorum. Tode Graffe. This small Ruth grasse (which the Flemmings generally call Padde graffe, that is, Tode grasse, and taken to bee the Holostium of Matthiolus in his last edition) groweth not much above a spanne high, whose leaves are very small, and those on the slender stalkes and branches from the joynts lesser, whereat and likewise at the toppes grow forth small yellowish chaffie heads or huskes, with short aunes as it were at theends, each upon a short Med un co footestalke one above another : the roote is fibrous and reddish. There groweth about Highgare and some other wet places one or two other forts hereof differing from it in fmalnesse, and likewise the one smaller then the other, whose heads are thicker or closer set together.

o. Gramen montanum Iunceum capite squamosa. Mountaine Rush Grade with scale heads From a small fibrous roote rife up two or three rush-like leaves about halfe a fooce long; the falkes are fmooth and without any joystor leafe thereon rifing a foote high, at the toppe whereof from betweenetwo rough leaves, the one being long the other floort flooteth forth a fealy head, small at the toppe somewhat recembling the head of the *Photoris* Canary Grasse.

The Place and Time. Some of these graffes grow on hills others in woods or neare them : the first on a high hill in wales called Berwin continually covered with clouds and milts, and watered with fundry showers of raine, when at the same time the Sunne will shine faire in the vallies below it : the woods neare Highgate and the medowes thereabout doc nourish many of the other varieties: the last was found on mount Baldur, and doe all flourish in the Sommer moneths of Inne and Inly.

The Names, By the name Xiraro in Greeke, and Gramen Jancenm or Inneoides in Latine beall these planes knowne i The first Lobel had entended to call Nardo Gaugiti forrie smilis capitario planta, but. I have altered it and selfered it rather to these Rush Grasses whereunto it is most like, and so is the second also, being neither of them mentioned by any before : the two forts of the fixt, the feaventh and the two fmaller forts of the eight are not the wife extant in any other author : the third fourth fift and eight are fo emittaled by others as they are here for downe, yet Thalise calleth the eight Gramen epigonato caulon, and Banbinen Gramen nemoro sum caliculis paleacentout I thinke it is feldome in any wood : the last Banhinus so called as it is in the title. The Vertues.

All these forts of Grasses have beene so lately found out, that there is no knowne use made of them in Physicke; and for the eight although Matthiolus in his last edition gave the figure of it, entituling it Holostium, and with out any description, and seemed to referre it to that of Dioscorides, whose propertie is to binde and consolidate flesh whereof this is no way gulity, but it is altogether infipede like a graffe and without spee like a rush, and is therefore called Holostium Matthioli ever since by all authors or by these other titiles it beareth for it is not yet knowne what that true Holoftimm of Dieferrides is, not any knowne plant can bee found in all things to equal ir fully.

Proces. Rushes.

tiere are divers forts of Ruffies, fome great fome fmall fome fort and throath, others hard, fome barren others bearing fixeds, found their pointed, others not fome on the Landgeyther in uplands or neare the Sea, officia in the fresh waters from agains tweet, others not at all tof shote I means to our cate in this Chapter this are not further, for or choic timbes the one called Schamopher or Instantial asso, and the other Inness anguilofs or Operus adoratus, I have spoken in the first Classics of this worke among the other inness anguilofs or Operus adoratus, I have spoken in the first Classics of this worke among the mount sweete herbes, and first of the fost primocrit force of Rushes in this Chapter.

The greatest Bull Rush.

The greatest Bull Rush.

the con-

14-54

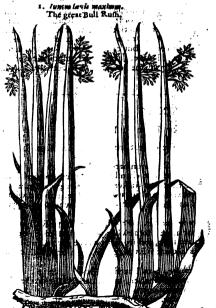

most colour, greater then any of the other forts of Rufhes, having certains sheathes like leaves compassing them gene colour, greater then any of the other forts of Kulhes, naving certaine inequalities and source and buttoner, and pointed at the ends button (harpic, full of a white pith which are ferviceable (the outer rinde his gilled away) for lighth, being divers of them bound together and dipped in Suce or Tallow's towards the expensivithich on the oberlide breake, fouth fundry intell brownish chaffic heads, each upon without roottalke, whether the protests of a blackish browne colour, and growth formewhat great and growth find of their brides in the roots is of a blackish browne colour, and growth formewhat great and growth find of their brides in the roots for the common finds of Railby.

This aft it in all things like the former but much lefter and shorter having a whitish pith within them as the attribution for the like tites, but that the heads are longer and the tark or pannish is close and not spread open untentitis: the rootes hereof are not great as the other, but are a buth of livings of shreds.

3. Innem levis panicula sparfamajor. Another fort of great smooth Rushes. This other greater lost is like the last but with fewer store of Rushes, of a darkith greene colour, and the tufe abor brownish pannicle is more spread at large, and each part standing on a pretty long footstalke, and is broad blow and pointed upward : the roote is bushie like the last.

4. Junem lapu glomerate flore. Round headed Ruffies. foundheaded Ruftes have divers thooses rifing from the roote like unto the found fort and pitthy within like i, the chiefest difference consistent herein that the turted heads stand somewhat close together and are round. not ainted at all. Inuces lavis papicula fparfa minor. Small Rushes with dispersed tufts.

This different from the greater fort before described, onely in the smalnesse of the plant, and growing in dryer gounds, which may peradventure cause the imalnesse.

2. 3. Inneus levis panicula for/a mojus er glomerato flore. Another fort of great (mooth Rush and pound headed Rushes.

CHAP.

saucus acutin Cambrob-iravicus. Wall hard or Stape Ruther

6: Inneus exigune montanus mucrone carens. Small smooth pointed Rushes.

6: Inneu exiguat montanus mucrons varente. Small hand long thred above in the high The roote hereof is small blacke and thredby, smeeting action and long thred above it, it has also three small long leaves at the foote of the stalke-of an inch long, like unto Rushes.

three small long leaves at the foote of the Italke of an inch long, like unto Kuines.

7. Inncellus five Chamefebenos. Smell or Dwarfe Rushes.

Dwarfe Rushes grow not above an inch on two high although they naturally grow, by ponds for him these or foure Rushes somewhat great and thicke for design proportion, plung from a throughout roote, the him these observed to bring any heads for seede, and therefore, is called approved to be the highest to seede, and therefore, is called approved to be the highest had been considered in the factor of the highest form.

Lobely, mentioned in the Adversaria by the name of Innahus, it growers formewhat higher, and begin round.

Many of these Rushes and shourish chiefly untill the end of Angris of September 2 yet abide. Seeme all

the yeare.

Solid in Greeke so called a love of fundaments of the place of Angult of September, yet abide given all the yeare.

Solid in Greeke so called a love of fundaments in the place of the place cus sive Scirpus medius, and saith it is the same that Tabermontanus calleth suncus splinatures a the third is the suncus out out on garis alter of Tragus, suncus sevin & vulgaris of Cords, Dodonest and Lobes, and Oxyschanes by Angui larn and Lugdunensis: the fourth Lobel calleth glomerato flore and Innens Simply by Matthiolus and others, and Inneus Levil by Lugdenengs: the fift is Baubinus his title and fo are the two last: the Arabians call it Dis, the Italians Giunco, the Spaniards Inneo, the French Ione, the Germane's Bintzen, the Dutch Biefen, and we Rushes. The Vertues.

The feede of Rushes of this foft kind especially faith Galen and Diefebrides, tofted faith Pliny being drunke in wine and water, doth ftay the flux of the belly or Laske and womens Courfes, when they come downe two abundantly: it provokethallo Vrine; but it caufeth headach: it provoketh fleepe likewise, but it must be given with caution, least it bring a dead sleepe with it: the bottome or tender leaves or part of the Rushes next to the roote being applyed to the bitings of the Phalangians or poysonous Spider healeth them; the roote saith Phay boiled in water to the thirds helpeth the cough. Phay maketh mention of an Ofenna Inneinnum made of Inneus as sweete as that of Rofes, but fure it was not made of any of these forest of Rushes, but of the Imagin odorum, sweetesfuling Rush. Galen sheweth excellently the property of the seedes of Rushes, that it is compounded of an early effence tomewhat cold, and a watery somewhat hot: so that by drying the lower parts it doth leasurely send up vapours to the head, whereby fleepe is procured.

CHAP. XXXI.

Innens after five Arnens. Hard or Sharpe Rufhes.

F this kinde of Rushes there are also divers forts, some great, and some small, some bearing seeds others barren or bearing none.

1. Inneus acutas vulgaris. Common hard Rushes. Our common Rushes that serve to strew the roomes and chambers in houses growen in the same manner that the former fort doth! but that sometimes the stalkes as it were give Rushes one from out of another, and not all from the soote separately as others, and are also hard and sharper pointed, with little or no pith within them, the tusts are small, hard, spread abroad and short, that breake out towards the toppes as the

other forts does 2. Oxyschanos sive Inneus acutus Alpinu. Cambro britanicus. Welsh hard or sharpe Rushes, The Rushes of this fort are many about halfe of footelong or more, somewhat great hird and sharpe pointed, from among which rise up, naked Rushes or stakes halfe a yard high, and from betweene two short leaves breaking forth a sparsed pannickle, of sundry small chassic hike unto Reed grasse, of a brownish colour: the roote is a bush of brownish hard fibres.

This finall Rush groweth very like it but closer and not so much spread open.

4. Images maritimus capitulis Singlis. See hard Rushes with blackish round heads of seede.

This hard Sea Rush hath singly skinny browns heads, set next about the hard long slope roote which hath manning the skinny browns heads, set next about the hard long slope roote which hath manning the skinny browns heads, set next about the hard long slope roote which hath manning the skinny browns heads, set next about the hard long slope roote which hath manning states the skinny browns heads, set next about the hard long slope roote which hath manning states ship the skinny browns heads, set next about the hard long slope roote which hath such same ship the skinny browns heads, set next about the hard long slope roote which hath such same ship the skinny browns heads, set next about the hard long slope roote which hath such same ship the skinny browns heads, set next about the hard long slope roote which hath such same ship the skinny browns had ship the skinny browns heads, set next about the hard long slope roote which hath such same ship the skinny browns heads, set next about the hard long slope roote which hath such same ship the skinny browns heads, set next about the hard long slope roote which hath such same ship the skinny browns heads, set next about the hard long slope roote which hath same ship the skinny browns heads, set next about the hard long slope roote ship the skinny browns had ship the skinny browns heads, set next about the hard long slope roote which hath ship the skinny browns had ship the ski

ny fmall fibres under it, out of which rife thickeround hard, long and very sharpe pointed Rushes, from among which rife other Rushy stalkes three cubits high sometimes, bearing at the toppes from betweene two short leaves a number of blackish round heades a little pointed, sometimes but one and sometime two or three standing close

C. Juneus acut me maritimus alter. Sea hard Rufher with whitish round heads of seede.

joyned together, hanging downe from a short sootestalke, which when they are tipe open into three parts show. ing imall and fomewhat long feede within them.

5. Mineits acutun maritimus alter. Sea hard Rufhes with whitish round heads of feede. This other Sea Rush groweth after the same manner that the last doth in all things, as well in height as in thicknesse or greatnesse, onely the heads of seedes are rounder, and not pointed, and breake out of the Rushes, two or three inches under the toppe, or sharpe pointed ends, about Midsomer each of those round heads will becovered as it were with a white downy or cottony matter, which bindeth and dryeth exceedingly.

6. Iunem acutm maritimus caule triangulo. Sea thatpe Ruthes with three square stalkes. The roote hereof is preeping and fibrous sending forth a few thore leaves, and long three square stakes about a foote in length, very sharpe pointed at the end, two or three states under which breake forth sundry scaly and woolly heads of a brownish colour.

7. I jugus sentus maritimus Anglicus. English se hard Rushes.
Our English Sea Rushes differ little in the growing from the other Sea Rushes, but that the pathickle is longer

and flenderer composed of many chaffie huskes.

This French Rush hath many sleader tought and pliant long and sharpe phinted Rushes, of a pale greene colour, from among which silect a small stalke, little longer then the leaves, between arther tought sheet leaves, whereof one is exceeding long, and the other are short, in the middle of whom standard large rotme these composed of many long sharpe huskes set in cares, of a pale brownish colour, wherein lye intall sender little bodie is brown some small, and creeping, set with divers short sho

The Place and Time The first growers in many sow moist neglected grounds and fields, where it faketh un most i roome, and doth little good: The second was found by Doctor Label, in his life time, upon the hill in which the faller farm, in sundry the wet and moorish grounds, in many places thereabours. The third about Markons as Label saith, and betweene Saint Ishns de later and Bayon as we have been enformed. The sixth both on the Namestan shore, and in the way from Mompelies of the Sea. The second many of our English coasts. And the last about Narbone in France also. and doe all flowing in the end of Suppose.

The Names. The Greekes call it O Evocato Oxyfebenes, and in Latine thereafter, Institu acutus & after. The fift is called Inneus acutus & vinlgatior by Lobel and Dodoness. The fecond hath not begin fet forth before, and therefore both the name according to the place of the growing thereof. The third is all but now made knowne to all. The fourth and fifth are fet forth by Lobel and Pens in their Adversaria, under the title of Inneus maritims duplex. The former Banhinm calleth Imans acusus, capitulis Sorghi Oxyfchenos Disferridis. The later is referred by him unto the Inneus Edolofchenos major of Ingdunensis, and was brought by Bockistrom Bayen, by the name of lunus Coriandri seminerotundo, and taken to bee the true Oxyfchenos of Dioscorias. The fixth Banhinus calleth as it is in the

phritle: The feventh is seculiar to our Coalts and hath the name accordingly. The last is the Inneus maritimus Internation of Lobel, whereof I cannot finde that Bankinus hath made any mention. The Vertues.

The properties of this hard Rush, are referred to the former, working the like effects as it is thought, but more

CHAP. XXXII.

Innem acumine reflexo. Hard Rushes with bending heads.

Here are yet some other kindes of Rushes to be handled, which because I would not huddle together, I must distribute into sundry Chapters, that so every species may be under his owne genus, as necre as may be. I. Innew acumine reflexo major. The greater bending Ruth.

The greater of these turning Rushes, groweth after the manner of the greater foft Rushes, hath for his rootes formewhat round heads, covered with blackish browne coates or filmes, and

undertiem, to of threds, from which heads rife fundylog Rushes halfe a yard long of more, breaking godwy under the coppe, which bendeth or turneth downwards, out of a round skinny head into many timy round heades, franding on thort footestalkes which have as it were five corners, full of cornered hapevery small yellowish feede, of a little harsh

2. Iuncus acuminereflexo alter.

Another turning or bending Rush. This other hath the Rushes more then halfe a yard lore having a blackish thining tust or umbell, breaking forthiwo or three inches under the turning end, and linding without any footestalke, which are composed allofteds or thrumsand blewish at the toppes.

3. Iuncus acumine reflexe trifidus. The triple tufted Rush.

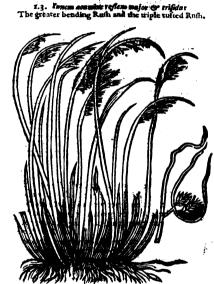

Theroote hereof is blacke, joynted, and fibrous, the Rulles are many, flender and foure or five inches long, inflakes are parred at the toppes into three, and feldescinto fower flender long Rushes, three or foure inde long a peece, betweene which come forth three full chaffic tufts or panickles.

The Place and Time. They all grow in France and Germany, and keepe the incline that others doe.

The Names .. Thefirst is called by Lugdonenfis Innens Melanerania of Thephrastus, who taketh it also to be the Juneus Onsibenos famina of Theophraftus, Gasner and Taber-

mumu call it Innem lavin, and may be Thaline his imm Lychnanthemos. The other two are remembred by Bauhinus in his Pinan and Prodromus, but in my opiniuthelaltis the small Inneus maritimus alter of Lobel, as whose will compare them shall finde.

The Vertues. We have no other certainty of the Vertues of these, but a likelihood to be as effectuall as the last kinde of

CHAP. XXXIII.

Innem aquatiem capiculis Equiferi. Aglet headed Water Rushes.

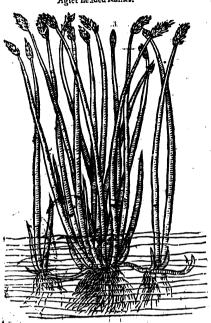

Here are two or three forts of this Aglet headed kind of Rush, which for the difference sake from the other kindes of Rushes, I thought good to entreate of by themselves. I. Innem capiendio Equiferi. Aglet headed Rushes.

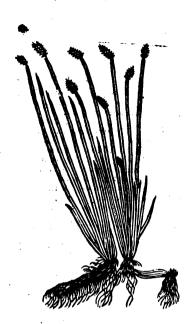

This lefter four bringests torth from a creeping fireading roote, flored with many intricate fibres, divers flender naked Rufhes about a cubit long, full of whitish pith, and having at the bottomes of the certaine reddish skinners compassing them, and bearing each of them at their toppes, a small catkin or Aglet the first head of an Alparague, blooming with small white threds, like a Plantane head, which fall away

2. Inneus capitulis, Equifoti alter. Another Aglet headed Ruih. This other Ruth hach fundry thort Ruther viling from the creeping roote, from among which, other flender and the Ruther does fpring about a foote high, each of these bearing such a like Aglet as the former, but somewhat TRIBEIL

1. Inneus aquaticus capitulu Equifeti.
Aglet headed Rufles.

2. Inneus Equifett capitulis alier.
The other Aglet headed Ruth.

13. Immeellen capitulis Equifeti fluitans. Floring Rushes with Aglet toppes. This (mall Rull) hath from a small threedy roote, commeth forth a very small flender bowing Rush, which dividerh it felf into many other small Rushes shout two or three inches long; floating upon the waters, where it growith Wiltiebt Tome grow upright and others doe bow or bend downe againe, each of them bearing a small growith. Wherept tome grow upright the former, with a small long R pull growing by it head like the former, with a small long R pull growing by it.

There all have beene found in our owne land, as well as beyond Sea, the first not onely in the ponds and waters of a small village called Austrope, hard by autro-pe, but in divers places with us also, the other in the brookes and ponds, of been wales and England, in sundry places and are to be seene in the end of Summer when they slowish. The Names

The first is called by Lobel Inneus aquaticia minor capitalis equifeti, and by Lugdunenfis Inneus clavatus Dilechampy. The second hath his title sufficient to expresse it, not being described by any other. The last Banbians to calleth asit is in the title, yet calling it minor, as he doth the first major.

The Vertues. There is no property knowne to what malady any of these may be applyed but are held unprofitable as a great many others be.

CHAP. XXXIV.

Inneus cyperoides floridus. The flowring Cyperus Rush.

Here hath formerly beene knowne but one fort of these slowring Rushes, but Banhinin hathadded

This preater flowing Cyperus Rush (as it is differing from all the other forts of Rushes, soites.

This preater flowing Cyperus Rush (as it is differing from all the other forts of Rushes, soites.

This preater flowing Cyperus Rush (as it is differing from all the other forts of Rushes, soites.)

The preading the control of the contro creeping or ipreading roote like the Rushes, bushing with many fibres, from whence ipring round smooth Rush creeping or ipreading roote like the Rushes, bushing with many fibres, from whence spring round smooth Rush like stalkes two or three cubits high, bearing at the top a large spread tust or umbell of pale blush coloured sweet frequency of states and a state of the s

long tharpe pointed Ruth like leaves, two whereof rife higher then the stalke, and at the toppe five flowers, one

bring after another, after which come two fmall round heads guerther on each footestalke, of the bignesse of the Candy bitter

The Place and Time the full groweth in watery disches pooles and plathes, in most The interest of the Street of the Street of the Street of the Kingdome: The other hash beens observed in Swiffing fundry places, and are flowing has all the Summer long, moning the feede in the meane time. The Names,

Although this hath so Greeke name, yet it hath found divers line name, being called by Tragus Calamogrofia feemide, by Makini Lugdanenfis, Camerarius, and others, Imneus floridus, by bol, Inueus Cyperoides foridus paladofus, by Cordus, Gladiolus palati, by Dodonaus, Gladiolus agnaticus, who findesh it erromain them that call is Inneus floribus, but is in as great an error indicto follow fordes, that calleth it Gladiolus from the false than the Carae, wasking Theodonaus the Carae was the Carae of the contraction. radation of Gaza, making Theophraftus his Cyperus to be Gla-dan alloy (it may be) milled him before, whereunto it hath no confondence, faving a little in the leaves, hee also taketh it to h Sugaium Diofcoridis, wherunto it agreeth as little, fome also be spression Desporates, which we agree as little, some allocally listeness Theophrafts, and Louiserus Carex altername. The place all it Ginnes florido. The Dutch Water Lifel, and General Water Gladioll, following Cordus, who confoundeth Theophramisis Cyperis, with Dieferishis Gladiolus.

The Vertnes .: Manhidus faith it is thought to worke the like effects that the the forts of Rushes doe, but according to Cordus his mi-hing it to be Gladiolas, he saith it is good to helpe the paines of women in their delivery of childing, being boyled in wine and

1. Innen floridas. The flowring Rufh.

CHAP. XXXV.

Spartum berba five Innem. Matt weed or Mat Rushes?

Lthough the Spartum Plini be a kinde of Rulh, growing rather in dry then moilt places, yet because the other sorts of Grasses that serve with us for the same purposes, to make Mats and other such like worker, doe grow in wet and Moorish grounds, neare the Sea side, and are called by the fame name of Sparsam, I must rather then divide it place it with the other.

it. Sparsam Plani five Innoun Hippanica. Spanish Rushes.

The Spansh Rush rifeth up with a number of round Rushes a cubit long, each whereof is parted a

histore the ground, into three or four more flender long, tough and greene Ruffles, fomewhat broader at his, being whitish in the middle, which soon after have both their edges to drawne together, that it maketh trakeme round, so that the partition is hardly discerned, and then grow harder, and whitish, when they are the week them in trailes, and in the round mats wherewith the floores of chambers are matted, as they are weight there and brought over to us), from among which rise up fundry stalkes, somewhat higher then the kenbering at the toppe a small long head of many sharpe pointed huskes, after which come small long seede, kemplome of the other Graffes: the rootes forcad in the ground into many tufts, matting therein that in foreplaces they take up two toote fquare or more.

lim there specify the particulars, the Rushes are more interest modifies. The softer Spanish Rush.

This other Spanish Rush groweth in the very same manner and order, that the former doth, and different from teally in these particulars, the Rushes are more fine and flender, softer also and bearing a shorter tust at the top, taking out of a skinny banks or hole: the roote hereof doe mat like the other, and grow in moister places.

3. Sparism marinum meltra. Our Matweed on Marram.

This Matweed hath divers long hard, and very sharpe pointed Rushes, piercing their legges that are not boothering among them, the stakes have soft spiked long heads, like unto the cares of Rye, and blooming like it the notes of the source creepe in the ground, and falten themselves strongly therein.

4. Sparium mariumm nestras atternm. The other of our Sea Marweedes.

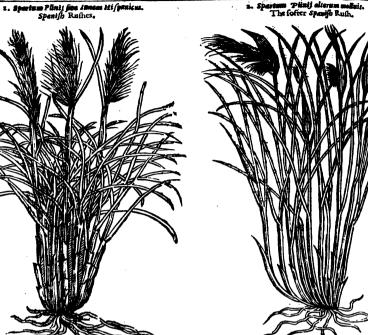

This other Marweede is in the growing like the former, but that the rushes are broader and shorter, and the

This mail Marweed harh shorter smaller and hander rushes, the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high, having small thin long the stalkes are a cubit high. wrought into little baskets or the like.

Ç.,

THE 12.

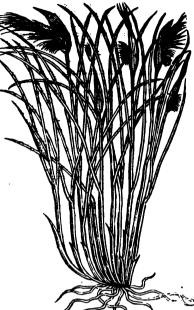

5. Spartum parvum Batavicum & duglicum. Small Matweede.

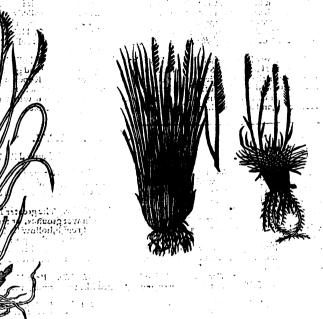

Spartum matinum noftras. Our Matweed or Marram,

2. Spartum Plinij alterum melinis. The forcer Spanife Ruft.

4. Spersum marinum nostres alterum, The other of our Sea Matweedes.

6,7. Sportum Narbonenfe es minimum Auglicum. The imali French and English Matweedes.

6. Sparstin Narbonense. French Matweede.
The French Matweed hath smaller rounder and whiter leaves or rushes then the last, and closer growing togethe like unto the smallest and finest four of rushes, and are about a spanne long aprece, or somewhat more: the
small ender stakes have small single heighed whitish spikes on them, smelling like Mosse: the rootes are small bott threds.

The smallest English Matweed harh many smal stender round rashes like threes, almost four or five inches long, swing thicke together, and many smal stender round rashes like threes, almost four or five inches long, swing thicke together, and single like the swing thicke together, and single like the status consisting but of one or two small rowes: the rootes are long and yellow, like the former small English

8. Spartum Bafflerie capillaceo folio. The Germane Matweed.

The Germane Matweed bath landry rullies rifing from the small threddy roote, which divide themselves into struy the Rullies, sometimes but hate a frost long, and sometimes a foote, there hath beene no had or spike small the struy the Rullies, sometimes but hate a frost long, and sometimes a foote, there hath beene no had or spike small the structure of the structure o

Deriving our ingatum. Party coloured Matweede.

The result inflors of this high weed are followe above foure or five rising from the roote parted real and greene, where training from the roote parted real and greene, while training the party of the spatial come all to be of one colour, this was found on the falling by Franching Franching Training. The Spatian Antiribody of Clustus I have fet forth in my former Booke, under the title of Grant Plantager.

The two former form grow not onely in Spaine, but in divers Mands belonging thereto, as the Conserver, Made-

Aprenate, a property frewed you the Sparram Grecorum, which is a fibrably kinde of Brooms. to doe I this be called Sparram Reported by the Sparram of Pliny, which was in his time as plentifiedly growing in Spaine as now, and therefore the Tractybercof was called Sparram comme, wherein new Carthage, called Carthagena now standeth, and therefore all Writers call it Sparram long terms, onely Dalechampine upon Pliny calleth it Innew Iterica few Hispaniens, and Bashinin, Gramen position priminal partial company and called Sparram Plini; or berba alternam, by all that Bankinin, which is spartam feigulage passible brevs followed include. The thicken the Sparram berba terria maritimum of them, who calleth it Spartam feigulage passible brevs followed include. The thicken the Sparram berba terria maritimum of them, who calleth it Spartam of the court of the cou

Lobel calleth Spartum noftras alterum, and Bashinus, Gramen Spartenso Spicasaus latifolism. The fifth is the Sper Lobel calleth Spartum no firm after sm, and Baumann, Oramon specific being to be found with us as well as with tum noftras parvum of Loves and 1 nave auded angulam. The fixth is the Gramen Sparteum Monspillens of Basthem, Bauning callett it Gramen sparterm Innergotium. The inxel is the gramen Sparterm Monspiling of Bashing, but it being sent to Doctor Lobel from thence was named as it is in the title, which is not much differing. The seventh was found in our owne Land, and for the smallnesse called minimum. The two less are called by Bashinus, Gramen Sparterm, with the rest of their titles as I here set them. The Italians and Spaniages, call it Spane, and the second sort Albardi, The Dutch Halm. And we in English, Helme, and Matthewede, has the people all along the Coasts of Norfolke and Suffolke, call it Martam, and may be called Sea Rustings as well. The Vertues.

The Vertues.

We know of no use the latter in Phylicke: but are employed wholly by the the the latter in all the places where it growed (I meaner the Shariff kinde) not onely for Mats, small and great, for the history, small kinde, and baken so with the farmes the thing entire of the control of the same state the purposes, shoots, Coates, Repersor Contained many other such like as but the ferond in being lefter, and not fit for such purposes, are used to fill sacker so serve item for his does with stray to be upon, our Sea kindes are used by diverse, both with us and in the Low Countries for Mats, Hassocker, and diverse that such like meane workes very serviceable.

CHAP. XXXVI.

Equipment. Horsetaile or rough joyneed Rushes.

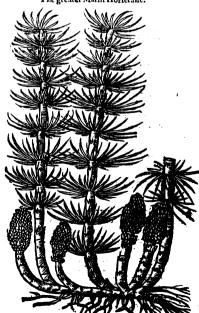

Sa Complement to fall a this history of Rushes, let me joyne this mato them, for I thinke they may very well be both for their forme, although differing in roughteethe, joyne, and potture of leaves, as place of growing, wherof there are many forts, both of the moorish and woland grounds, as shall be showed.

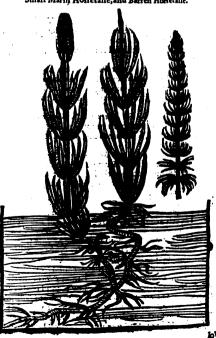

1. Equifetum majus palustre. The greater Marth Horsetaile. The greater Horsequie that groweth in wet grounds, at the first springing bath heads somewhat like to those of Asparagus, and after grow to be hard rough, hollow stalkes, joynted at sundry place up to the toppe, a foote high, fo made as if the lower part were put into the upper, whereat grow on each fide a bulh of finall long Rush like hard leaved sach part refembling a Horictaile, whereof it came to be to called, at the toppes of the stalkes come forth small catkins like unto those of trees: the roote creepeth under ground having joynus at the content of the stalkes come forth small catkins like unto those of trees: fundry places.

2. Equisetum palustre Linarie scoparie folio. Broad leafed Horsetaile. The roote of this Horsetaile creepeth, and is joynted like the former, the stalkes like wife are a cabit high, bol-

1. Equisetum majus paluftre. The greater Marsh Horsetaile.

7. 8. Equiseum Lunceum fine matum et ramosum. Naked, and branched Rush Horse taile.

low and joynted in the lande more than feet with leaves after the feet fifthin but that they are the their then those of Tode Farand like almost unto those of Broome Tode Flax, greene rough, long, and casie to breake, what jule or catkins it beareth

the hot been conferred a large of the state in homelic formers the chiefelt difference refteth in that it is !! faller, and the leaves or briffice as fome call them fewer and hoter that are fer at the joynts.

4. Equifetime electrine brevioribus folige.

Bairen Marth Horfe taile.

"Thisother small Horse taile differenth little from the last, faving that this is often found not to beare any feede as the others doc, und yet Banhimus calleth it Palyformon, as being plentifull abering feede ar the foynts at some times and in some places.
5. Equiferent omnium minus tennifolium.
The smallest and finest leated Horse saile.

This Herfe taile that for the imainefic and finenefic of the langrowing in the lower wet grounds in the woods about Helier not fare from London, delerveth alfo to be numbred while refl. growing in the fame manner that the others doe, wanter retegrowing in the lame manner that the others association only antice foremanded parts. This feether the odifier funds, which with Baubinus in his Probremus is the third calling a fanifestum palafter, remailing to longificum fairs, onely negoting higher and the leaves foreman the longer.

6. Equiferum minus polyflaction.

Many headed Horfe taile.

La the formed and various recent in the forested failes and

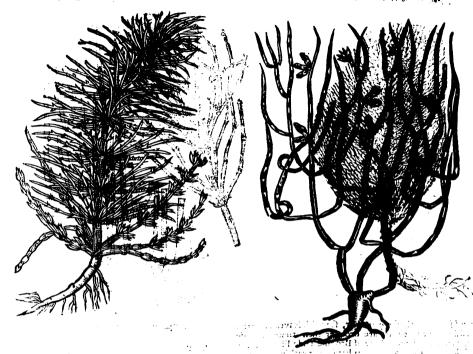

lathe joynted and juming rootes, in the joynted stalkes and .. nat:30 minot from the former small ones ; but in this, that at the joynts it beareth three or foure fine small stalkes with

simil dose former trans ones tout in this, that at the joyus is pearent the one in a limit takes with a simil dose spike at the fine of the maine stakes, more loosely set of more opening then the rest blooming very pale binsh flowers. I have been the rest blooming very pale binsh flowers. I have been the stakes, more loosely set of more opening the stakes. Rush consider this takes, more loosely set of the stakes, more loosely set of the stake Kkkkk 3 mati legal land

27 . Equifte The greater medow Harlezaile.

to smooth and polish their workes of wood and bone then any other; the roote is joyned likewife and

8. Equiferem Lunceum ramafam. Branched Rufh Harfe mile. This differeth onely from the laft, in growing with many falkes from the copy of one shot full rifeth ont of the ground, and that many of those stalkes doe branch themselves forth into others, all of them full of joyng and without leaves.

9. Equisetum nudum minus variegatum. Small party coloured Horfe taile. From a small blackish creeping roote spring up sandry small hollow pale gueene Ralkes of a stoote and some much lesse high, sull of joynes, the lower joynes whereof are blackish and the upper whirsh without leaves (yet is most likely to bee the same Mr. Tokusan in his Gerand faith hee: found with small leaves, and callest Hosse taile Coralline, howfoever this may famerimes freme to differ both from Gefier and his) at the toppe whereof standeth a small short head, somewhat like a small catkin, the growne whereof being white bath eight or an very fmall sharpe pointed leaves under it, which being troden on will cracke and make a noyle.

10. Equifeium feridum fuh aqua repens. Stinking Horfetaile.

The flinking Horfe rafte groweth up both in and out of the water, with fundry branched flalkes, but fliped athwart, and fet with fhort leaves at every joynt, having divers imili threds growing at ipate on them, greene while it is in the water, but taken forth and dryed it becommeth gray and brittle; eafle to be subbed into poother with ones fingers, and falling also into pouther of it selfs: by lying and smelling somewhat like unto Brimsonerit groweth not onely in the ditches of the bathes of domina means Paden but in Laform and Baffit also. And these be the forte of Horse taile that delight to grow in waters and wet grounds onely, and are not to be found effective. There are some other form that are sometimes found growing although feldome as well in the lower wet grounds as in the uplands, which for their double habitations I shought good to separate by themselves, and speake of them in the last place.

1 1. Equisetum pratense majur. The great Medow Horse taile. For the forme and manner of growing this differeth not from the former but, in growing greater and balling with more flore, and longer leaves then any at the joyata, each leafe being also joyated with intie, feare difernable joynts.

12. Equifering a venfe lappioribus feth, in Corne Horfe taile. This Corne Morfe taile groweth very like the laft, but greater in bulke although foffic what thorter in leavel, and not joynted at all that ever I could observe, you know from the last that ever I could observe, you know from the last that grounds of the Corne fields, and often planning any which shey fallow white grounds for great, there will be the last because the corne fields, and often planning any which shey fallow white grounds for great, there will be the last because the corner fields. like a small bush. 13. Equisetum

This finish Wood Horfetille groweth like the rest, but the joynts are farther seperate in funder, and the leaves lang few are somewhat small and long withall, the rootes are like the rest.

14. Equisatum mentanum Creticum. Mountaine Horsetaile of Candy.

This mountaile horsestale is somewhat like unto the eight fort here here fet downe, having divers Rushie with leaves on them, branching forth both above and below, in leaves on them, branching forth both above and below, in leaves whereof respectors in mail feeds within the coote is been and after them small long and gound reddish huskes somewhat small feeds within the coote is

CHAP, XXXIX.

Pappras. The Paper Reede.

He ancient Reede called Papprus by Theophrastus, Dioscoridas, Pliny, and others, whereof the Paper, and bookes were made, that were used in their and their former times, we may out of their writings describe unto you, if it be the same which Alpinon and others say, groweth now in Egyps, and they call by that name: however we will shew you what they said it was, and how it grew, and with all shew you how Alpine and others describe it now, and likewise shew you another fort thereof, as

1. Papyrus antiquerum Milotica. The Paper Reede of the ancients growing in Nilus. is taken. This socient Paper reede (which Theophraftm, & from him Pliny, do describe) growing say they not in the depth of the River Nilm, but in the pooles of Egipt, whereing the River Nilm hath broken out, and in the River it selfe due River in the depth of the fireame, but neare the banker, where the water is offely about two cubits from the bore, or lefte, whose roote is of the thickenesse of a great mans wrist or fist, as he can graspe, (Pliny hath an armes bore, or lefte, whose roote is of the thickenesse of a great mans wrist or fist, as he can graspe, (Pliny hath an armes hore, or lefte, whose roote is of the thickeneffe of a great mans writt or hit, as he can graspe, (Pliny hath an armos hidsele) about tenne cubits in length, so eading divers of the long but, small and thicke rootes, above on the toppe of the mudde and earth wherein it groweth, from whence rise three square corned stakes, (they are in the fextermed Papyros, which I so translate, for of leaves they have no mention) of source cubits bignesse almost, spreading into many parts, and growing smaller to the toppe, where it carrieth an unprofitable bush or mis without any fruite or seed. This is Theophrasse his design word for word, as necre as the description could the state of seed, which Plum hard almost it form.

The Paper Reede of Nilse now growing.

khonght into sence, which Pliny hath altered in some miner and curtailled in others, ferring downe Thyrfus for morana curcaises in occurs, iccining cowine 2 system for Coas, they being of different forme, yet Veftingium faith the intexpresses them both, and leaving out Theophra-fu his four cubits greatnesse, which is somewhat diffialt well to understand and to apply to the purpose : bestore will I here give you the description therof, as therefore will I nere give you the description theros, as a share fift, and Vestingiass since bath amended it. It rishes above the water, from a reede like roote, with may shres thereat, with fundry three square stalkes, sometimes seven cubits high or more, with a pithia the midle, with leaves both above and below it, the greater mone, with the bottome are large (and three square as Almare sith, but Vellingiam faith nothing thereof) bending downeward like to the Burre reede or Cyperus, the lefter meunder the tufts at the toppes, which are composed diversiong and apright threds, let thicke together, and sill lowers at the toppes of them, which passe away without seede, as it is thought, for none hath beene obfired. This is their exact description of it, so that by comparing them both together, we may fay that the roote sike other Reedes, but much greater, that is as bigge as an wrift or arme, yet not of ten cubits long, for that faelthinke is more proper to the stalke, from the roote wheroppe of the tuft, the stalke it felfe (cannot be of four cubits greatnesse, for that compasse exceedeth a great me but) are about foureteene or fifteene inches comple, which may very well agree to the, naturall largest wath of Paper, which was thirteene inches as Pliny tondeth it, which was after it was wetted with the war of Nilss and imported out, and thereby enlarged, while love out from the ftalke, those inward being leffer and leffer. The plant fay the ancients is fweete and weely the Egyptians, before that bread of Corne was bowse and them for their food, and in their time was and the fweetcaselle firthed forth, the reft being that, the roote ferveth them not onely for fewell to burne, but to make many forts of veilels to use, for it

Redad much matter for the purpole: Pappra isfe (fay they) that is the stalke, as I translated it before, is profita-the many uses, as to make Ships, and of the barke to weave, and make failes, mats carpets, some kindes of garment and ropes alfo.

Papprus Siciliana. The Paper Reede of Sicily.

This other Paper Reede (which may be the Sari of Theophraftus, mentioned by him, next unto the Papprus, lib.

Alforder, p. which as he faith is very like it but leffe; being three square also), riseth size or seaven cubits above the water, having many three square and soft leaves broader and longer then those of Cyperus, or Sparganium: the hakes are many, this of pithy woodl, functh and naked, withour any leafe unto the toppe, where it beareth a live large thicke mit of close fet flender flakes, with final Mossie flowers on the heads of them, and a few short large under the min; which become fruitelesse, not bearing my feede: the roote is somewhat long like a reede, with the min; which become fruitelesse, not bearing my feede: the roote is somewhat long like a reede, with many fibres therest.

The Place and Time.

The Places and Lime.

The places of both these Reedes are expressed in their titles, the former properly in Egipt, and Syrid, as Their phrases also, neere Babylon as Pliny saith. The other groweth in Sieilia, and as its thought in Italy, and other places, being in growth much leffe then the former, and flourish in the end of Summer.

It is called in Greeke manie 9 and in Latine Papprus also, the stalk was called \$ish \text{9} whereof were made \$ish \text{which the Latines call Charta or libri, because the translators set libri, or cortex for \$ish \text{9}, not knowing other wise the property of the word, but as \$Piny\$ sheweth, there was no Charta leaves of Paper made of the bute, which show divided into thinne sakes whereinto it maturally parterly, the librium. wife the property of the word, but as Pliny sheweth, there was no Charta scaves or Paper made of the bate, but of the inner foulds, which they divided into thinne stakes, whereinto it naturally parteth, then laying them on a Table, and moiltening them with the glutinous water of the river, they prest them, and after dayed them in the Sunne, and according to the largenesse thereof was the greater prise, but because the later times of that old age, grew so copious in writing and transcribing Bookes, that they could not at any price, get infinite for their use. Attalian as it is thought first at Pergamus, invented the skinnes of bealts to be defined and dryed, sit to serve that purpose, which ever since have beene called Pergamus, sheeters or Bookes of Parchment, for it is said that the straightful straightful this Library at Pergamus with 200000. volumes, written on this Parchment. This by Ecology. that purpose, which ever time nave beene cancer of games and interest on this Parchment. This by Enforcement furnished his Library at Pergamus with 200000. volumes, written on this Parchment. This by Enforcement of the Garantie The Garantie alleged to the Country of the Count Attalus furnished his Library at Pergamus With 200000. Volumes, Written on this Fatchment. I his by Ensachius & Guillandinus de Pappro is called Papprus Egyptia five Biblus Egyptia. The second is called by Ensachius. Biblus seconda, by Guilandinus Pappris altera species, qua Paperus in Sicilia vocatur, by Lobel Papprus Nilosius, by Banbinus Papprus Syriaca, and Siciliana, and is likely to be that Papprus that Alpinus said, growth now in by Baubiniu Papprus Syriaca, and sourcemen, and is likely to be the Sari of Theophragus, and as I faid before, is most likely to be the Sari of Theophragus, which some doe thereupon call Pfendo papyrus.

The rootes of the ancient Papyras was much used to be eaten, as is before said, either raw, boyled, or realled, by the people of Egipt in former times sucking the juice, and spirting out the rest as T beophrastm, Dassonids, and by the people or Egip in former times accuring the juice, and spiriting out the set all large periods, and Pliny doe shew, it was used as Diofeorides faith, to open the closed mouthes of Fishilaes being put into them, the manner whereof is to take the dryed stalkes of Paper, and to lay them in soake, which being bound about close manner whereor is to take the dryed trainers of raper, and to lay them in loane, which being cound about close with a thred, is to be dryed againe, and then being unbound is to be put into those Vicers, whose mouthes are too studenly closed, thereby noteasily to be cleanfed and healed, which this being put thereinto, by the heate and mostlure of the Vicer, is caused to swell to that bignesse it had when it was greene, or soaked, making a hire way for the cure, in which manner also Guilandinus in Papyro, faith that the Chirurgions in Italy used the pith in the stalkes of the Milium Indicum, Indian Millet. The burnt ashes thereof were used to stay running Vicer, in any place of the body, but especially those in the mouth. But the ashes of the writing Paper it selfe, that was made of the stalkes performed it better : but whereas now adayes many by mistaking the ancient word Chara, doc use the ashes of our Paper, which is made of linnen cloutes, for the same purposes aforesaid, they eme grossely, and besides doe no good at all therewith, but in the stead thereof divers learned men doe advise to the the dryed stalke of Typha, to performe the same effect. Theophrasis declareth that they formerly used to burnethe rootes hereof inftead of fewell, as also applyed them to make many forts of utentile, or houshold vessels, for they yeelded much wood and very good, for as he saith, they made Ships thereof, and of the Bibles (which I shewed, the Translators not knowing the true meaning of the word, did turne it into Corres, the barcke) the stake they made failes, and coverlete, a kinde of garment alfo, mats, and ropes. Alpinou faith that the Egiptions use the after of the burnt stalkes of this their fort, in the same manner, and to the same purposes that the formed was need to be put unto. And besides, saith that the distilled water of the stalkes is very profitably used to take away the pinand web, and other milts and darknesse happening to the eyes.

CHAP. XI.

Harundo. The Reeds.

IF Reedes there are two principall kindes, the one sweete, called Calamin aromaticity or elevating where of I have spoken in the end of the first Classis of this Booke: the other not sweete, whereof there are many lorts, Dioscovides numbreth up five, Naftos five facta, Thely five Famina, Syringias five fin-laris. Donax five Cypria, and Phragmites five Vallateria. Theophraftur hath many more, and Pliny num-breth up five and twenty: most of which being knowne onely to us by the dry Canes, I shall give you the figure of some here, and speake of those that are proper to these neerer climates in this Chapter.

Our Common Reede shooteth forth with many great round hollow stalkes, full of joyats, somewhat closely Our Common Reede shooteth forth with many great round hollow stalkes, full of joyats, somewhat closely set one unto another, to a great height in some places more then in others, with long and somewhat broad had greene leaves at each of them, sharpe on both edges and somewhat compassing the stalke, at the bottomes braing a long and broad spread soft brownish pannickle at the toppe, whose chassing or downy, seede, shyth saws with the winde: the roote is white, hard, round, long, and with divers knobbed Joynts therein, running associated the winde of the stalke stalked from divers of the joynts: the whole stalked yeth and perisheth every years, yet is usually cut downe before Winter, when as it is growne white to serve for many purposes.

This rate Reede is like the former, in the manner and greatnesse of growing, differing onely in the leaves, which are each of them halfe a yard long, and two or three inches broad, with sundry great ribbes of veines running along them, and parted at the ends into three or source parts, some what like unto the Finger Hartistongue.

tongue.

3. Flarando Donax. The Spanis Reede or Cane.

The Spanis Reede different not in the manner of growing from the former, but in the greatestic, the canes of stalkes being harder, thicker and rising unto two mens height sometimes, whose joynes are more separate in sunder, with larger leaves at them, and a larger pannickle at the toppe. Very like here anto are the Reede that grow

inteladies, but by real on of the greater heate they grow 1. Harando Vall stora five outgaris. Our common Rec economic and greater, to that they lerve in flead of timbook to build their houses and to cover them.

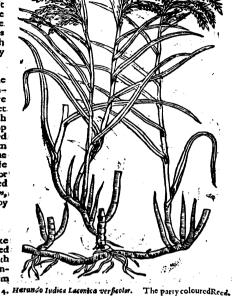

4. Harundo Indica versicolor. The stript or party coloured Reede.

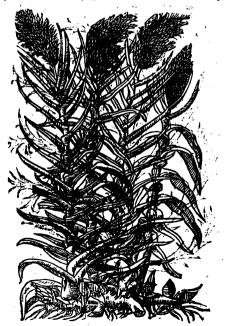

This Reede is in the growing like unto the last, growing amountail place as great and as high, although it be not with us, the chiefelt difference herein conflicteth in the selong leaves which are p.rted with white & green like the Lades Laces or printed graffe but with larger ftripes there is another fort hereof growing in Bengala which is feather and more pliable and apt to bend, whereof they

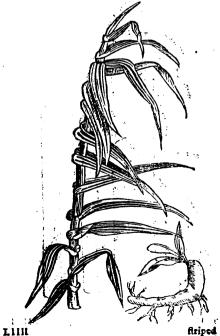

is the Sugar Cane or Reede groweth (naturally both in the Fift and West Indies but planted in lunday warme counnie kobee seaven or eight toote high, whose Canes are biget, then ones thumbe, full of a sweete pith, thicke fet with joyns and very long but narrow leaves at them. with divengrat ribbes in them, the tuft or pannickle at the top is like unto the other but thorser : the roote is not fo hard or woodly but spreadeth knobbed joynts and heads at them wheely it may be encreased, and is almost as sweete as the Cont: In the naturall places this yeeldeth forth of it felfe ofentimes or elfe being cut a certaine white juice or liquor which being dryed and hardned in the Sunne was called whencient writers Sal Indum and Saccharum Indum, which was used before Sugar was made out of the Canes by

6. Harnudo ramofa live Epigeios Lugdunenlis. Low branched Reede.

Thebranched Reede hath the lower part of the stalke with fort joynts onely without any branches, covered with a yellowish barke, but upwards it shooteth forth bunches on all fides, and they againe other leffer brandam to the toppe almost at every joynt, and all of them 1 Horsed Donax. The Spanifb Reede.

Harundo Elegia, Sagittalia, & farlia. The small writing Reede, the Arrow or Dare Reede, and the greater and lesser solid Reede.

2. Arundo grattimes denkara The thorny Reade.

friged athwart, with lines and scales thicke set on them without any leaves that were seene on it, being onely found by chance, in a sacke full of Cost and Ginger as it was brought from Arabia.

7. Horando miner sure Elegia. The small writing Care.

This small Reede may seeme to be the same with the last recited, and so Lagdanensis doth take it correcting Plain where he mentioned the Regide Heesia, that it grows that or high but spreadeth about the ground like a bush in golerant to cattle while it is fresh, saying it should be rather Epizeios: but Bellonium in his sirst booke of Observations and 47. Chapter saith he squad this Reede growing in a valley on mount Athos, which the Greeke hallowing with him called Flessia, whereof they made writing pens, as also lib. a c. 86. in the River Iorden, knowing there as seens before, for throughout all Tunker they tile no pens made of Goose quills as we doe, and those writing pens which we have seene have beene brought us out of Tunker they doe declare it to bee a small Cane with investike unto other Reedea hollow like a cuill. whereas that Epizeios of Theophrassua and Luedanensh have intuiting pension other Reeder hollow-like a quill, whereas that Epigeios of Theophrassim and Lugdunensis have greated a three and the characteristic and the ch niteris which is bigger and folia nor hollow-

8. Arundo graminea aculeata. The thorny Reede. This Reede shooteth forth thicke and short rootes with sibres at them, from whence extend on the ground his Retainment in the state of the final seasons and flores with final and long many joynted round Reede-like final kessabour a finger thickneffe, threading out into branches with finall and long entering the column fines at diffances, whose lower parts being broad compasse the joynts, growing narrow to the endwhich is very sharpe, hard and thorny; yet it hath neyther flower nor feeder that ever could be observed, and is simply without talks or but a little actimony therein: it groweth in moist grounds and watery places as other

The Place and Time. All thele forts of Reedes delight to grow in waters or watery overflowne grounds, the feverall countries are specified in their titles or descriptions, and are all ripe about the end of September.

The Mames. It is called in Greeke what and in Latine Calamiu and Harundo or Arundo as fome writes ir, whereof the mas according to Theophrafts is the Naffor fartta, the folid or fluffed Reede, and the femina the hollow. The first is Phragmatin as Ruellius and Dodonaus calleth it and Vallarie or Vallatoria, as Lobel, Dodonaus, Lugduneusis and others doe call'it, and Arundo paluftris as Muchiolus and Tabermontanus doe, but Anguilara calleth it Canda fining Dioforidis, and Gordus Calimnus vulgaries the fecond hath beene onely found withus; the third is called diands done Stica by Matthielus and others, and Donax five Cypria by Dedonans, Lobel and others, and Italica min by Camerarius, for indeede it is one and the same fort whether it grow in Italy, Spaine or else where, almanhone country greater and higher then in another, according to the foile and climate the fourth is probable nameto be the same that Theophraftus calleth Laconica; although it was entituled Indica by them that sent it : the his generally called Arundo Sacebarifera and Sacelarata by all that have written of it: the fixs is as I sayd the Arundo Epigeios of Theophrastus by Lugdunensis, which Bauhinus calleth Arundo repens, for what cause I know not, and Chamesalamus, and thinketh it to be that which Gefner in horiz calleth Arundo humilis, and Copia Elegia asit was termed by them that hadit, but furely the Epigeios is differing from the true Elegia as I have before flewed: the seaventh is called as I sayd before Arundo Elegia by the Grecians with whom it groweth. The last Mis to called by Alpinus as it is here. The Arabians call it Cafab, the Italians Canna, the Spaniards Cannas, the Inch Canna and Refeas, the Germans Korb, the Dutch Riet, and we Reede.

The Vertues. Galos faith that the rootes have a cleanling quilitie but not that pe and the leaves allo: The fresh leaves bruised. or the rootes applyed to those places that have thornes splinters or the like in the flesh doe draw them forth in a for space the same also applyed with vinegar helpeth members out of joyst, and case the paines in the loines, the field leaves also bruised and applyed unto hot impostumes, inflammations or S. Antiquies hie, easeth them the shes made of the outer rinde of the stake mingled with Vinegar helpeth the falling of the haire, the same things doe the other forts of Reedes as well : the flower or woolly substance if it happen into the eares, it sticktherein fo fast as that by no meanes it will be gotten forth againe, but will procure deafenesse withall : Some haveasit is fayd observed, that the Ferne and the Reede are at perpetual enmittee the one not abiding where the other is, as also the amitie betweene the Asparagus and the Reede to thrive wonderous well being planted among Recess. They are also put to many very necessary matters both to thatch houses, to serve as walles and defence ngardiners in the cherithing of their plants, to Watermen to trim their Boates, to Weavers to winde their rane on, and divers others uses. The Sugar that is made of the Sugar Reede, hath obtained now a dayes so contimal and daily use that it is almost not accounted Physicall, because of the temparenesse of heate and moisture theria nourishing much and helping coughes and hoarsenesse of the throate, and is used to be put into cooling as well as heating and warming medecines.

PLANTÆ PALVDOSÆ

AQVATICE ET MARINE MVSCI ET FVNGI.

MARSH, WATER AND SEA-PLANTS, VVITH MOSSES. MVSHROMES.

CLASSIS DECIMAQVARTA. THE FOURETEEN TH TRIBE.

CHAP. I.

Aving declared all the Grasses of the Vplands, with Rushes and the Vplands, with Kuines and Reeds, in the last foregoing Tribe, I thinke it fittest to joyne those o-ther Herbes & Grasses, that grow either in the Marshes or Waters, or neere the Sea side, before I entreate of the other Maritime Plants, & then follow on mt supra.

Trifolium Paludo(am. Marsh Tresoile.

The Marsh Trefoile riseth up with a spongious flexible stalke halte a yard high or more, with sundry smooth, thicke and somewhat broad darke greene leaves set thereon, at and foliations, three alwayes joyned together, and fanding on a long footestalke, from the middle of the stalkes up to the toppes, where comment forth a long bush or spike of fine pale bluth flowers, each of them confliting of five round pointed leaves, with a long thicke pointed umbone in the middle, which t gether with the leaves thereof are covered with a fine hairy downe or frize, which addeth the greater beauty to it, after which are past, come small round heads in their places, containing in them brownish yellow seede and bitter: the roote is long and white, creeping in the mud all about, and shooting aftern at the joynts.

The Place and Time. It groweth onely in wet and mobrish grounds, and will not abide out of it, for the stalke doth quickely grow lancke and withered being broken off from it, it flowreth in Iuly. and the feede is ripe in August.

It is generally called Trifolium palustre, or paludosum, and is the Menianthes of Theophraftus, which he faith groweth

Trifelium patedofum: Marth Trefoile,

invatery plashes, whereupon it is called by Lugdenen it, (who giveth two figures being all one.) Menianthes palifter Triophrasti, which different from the Menianthes of Dioserides, being the Trifotium Asphalisites or titumind.

[58] Dedonesse taketh it to be Isapprum of Dioserides, by correcting his Text, and yet it will not be, and besides

the correction of Trifolium his him and order with the correction of the second of the sec int, that some called it Trifolium and others Fibrinum as Taberhoot anis also doth, who maketh two inth that some called it Trifolium, and others Fibrinum as Taberhoot anis also doth, who maketh two intheteof, mejus and minum, and both names made from the Durch appellations. The Germanes calling it Biberthe in the College. And the Low Durch, Boen boomen, but of the birchnum. We call it in English generally Marsh and the college of the co Trefoile.ver tome Marth Claver.

The Vertues,
Weknow of no property in it to be applied as a tendedy for any dileafe, but if you will take it to be Isoprum; westown the frede is bitter as Mepprum is, then Dissertes the west that the frede is good against the cough, and the gires of the brelt or chell, for as Galen faith, it clenfeth and critteth tough and grosse humours, and unakering the gires of the brelt or chell, for as Galen faith, it clenfeth and critteth tough and grosse humours, and unakering the gires of the brelt or chell, for as Galen faith, it clenfeth and critteth tough and grosse humours, and unakering the gires of the brelt or chell, for as Galen faith, it clenfeth and critteth tough and grosse humours. then the eafter to be expectorate or spit forth; it is also good to purge or clense the liver, and helpeth those that

Calche palastris valgaris simplex. Common single Marsh Marigold.

He fingle Marth Marigold (for I have spoken of the double in my former Booke, although I give you the figure of it here againe) hath divers great broad round deepe greene shining leaves, a living dented about the edges avery one on a long thicke round fielhy stalke by it selfe, among which rise up far thicke stalkes, award high or neere, with some leaves thereon, and at the toppes divers faire great gold yellow stowers, the sunto Crowfoote showers, but much larger and shining, the roote is composed of smary long strings, which grow deepe in the myre.

It joyeth onely in waters, and watery ditches, and by their banckes sides, and slowreth somewhat carely promune that good while, and is past before the end of April.

The Names ...

hisgenerally called Caliba, and to put a difference betweene it, and the Calendula which is also called Caliba inbelled Caleba paluftris. Trague callethit Caliba Vergilin, and Gefner, Caliba paluftris, who allo faith it was called flome Ferraria from the dikene fle of the lease unto an Horse shape, Cordus callethit Chelidania paluftris. mil Tehermontanies Populage, for what cause I know not nor yet why two forts, whereasthey are all one although

Calcha paluffris quigaris fimplex. Common fing's Much Murgold.

Caliba flore tieno. The double hearth Marigold.

leffer or greater in one place then another. The Dutch call it Dotter blogmen, And we Marth Marigolds of Great Gouldes, and in some Countryes Bootes.

The Vertues We have not understood that any hath applyed this in Phylicke for any griefe or difease.

Cotyledon Paliffrit acrit Septentrimalium.

CHAP. III.

Cotyledon paluftris. Marth Benny wort.

greene leaves, a little hollow in the middle and unevenly dented about the edges, each standing on a small long footestalke, the flowers are very small and white, comming forth under the leaves, the rootes are very imall fitres that doe not grow deepe in the ground. The Place and Time.

It groweth alwayes in wet grounds, marthes or bogges, as on Hampfrede heath, and in many other places neere London, and How-reth in Iuly.

The Names. It is called by most Herbaristes in these

daies Cotyledon palustris, and aquatica, Lobel call thit, Cotyledon aquatica acris Septentrionalium. and in his observations maketh a doubt if it be not the Callitriche of l'liny, but is taxed therefore by Columna, who calleth it Ramment w agnation ambilicato folio, making it a Raranculus, as it is most probable, how soever it be termed Caryladon, from the forme of the leaves. Our Anotheraries as well as they beyond Sea, did use this kinde inflead of the true Vmbilion Venera, being deceived in that the forme thereof doth somewhat resemble it, but sure they have amended that error now, in better knowing the true plant. It is called in some Countries of this Land the White rot, because if sheepe seede thereon, it will kill them.

The Vertues. By reason of the sharpe taste it cannot but be of an hor quality somewhat like the Crowsecte, and therefore requireth respect in the use and not a current tradition, we have no certaine property recorded of it.

CHAP. IV.

Ranunculm palustris. Marsh Crowfoote.

If this kinde of Crowfoote there are divers forts, which shall be declared in this place, being reserved

T. Ranniculus paluftru flammens major. The greater or Math Spearewort. This greater Marth Spearewort hath a long joynted roote flored with many blackish fibres from whence rifeth up a thicke joynted smooth stalker wo toote high, swiffied with large and long shi ning, and smooth thinner leaves then in the next, some being more then halfe a foote long, and two or three inches broad, but inaller up to the toppe, where fland a few pate yellow Crowfoote like flowers, but larger then in

The lefter Spearswort groweth up with more flore of tappy greene stalkes, with longer, thicker, and narrower the lefter Spearswort groweth up with more store of tappy greene stalkes, with longer, this ker, and narrower to the second tappy greene stalkes, with longer the second tappy greene stalkes and tappy greene stalk leaves thereon, and more trose of pale yellow flowers, like other forts of Grow frene, the feede that followith is like other forts of Crowfeete : the roote is nothing but a bush of threades or fibres that grow deepe in the mudde.

This other dented Spearewort is altogether like the laft or is the very fame bur that this is oftentime found, ha

this other dented spearewort is attogether the tholast, or is the very tame but that this is oftentime found, having the leaves dented about the edges in ance plents, then in the other, for both of them is often fene, the plaine with tome dented leaves, and the deated with four plaine leaves among them.

4. Raniments framework leaves are leaves among them.

We have had another fort of Spearework leave us from Bayon, growing in their Marthes seem the Sea coalls, whose leaves are long and narrow. Althou pointed arther ends, the flalke is branched and beareth larger yellow flawers then the laft, the rootes are like it.

5. Ranunculus flamment flore albo minor. Small white flowred Spearewort. This little Scearewort hath fuch like long leaves as the leffer Spearewort hath, flanding upon long footestalkes but leffer and narrower by much : the stalke is bare without leaves, faving that at the toppe where the sowers breake forth it hath two small long leaves, the flowers are smaller then the common small fort, but pure white, the feede and rootes are alike alfo.

TRIBE 14.

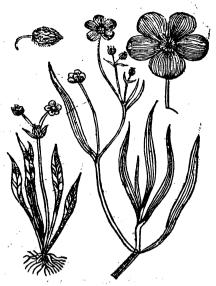

1,0,3. Renausalm flammene major, miso r ep-felie ferrate. The greater and lefter Marsh Crowfoote or Spearewore, and with dented leaves.

nculus palustris Sardonius latis. Round leafed Marth Crowfoote.

4,5. Ranunsulm flammem maritimus Bayonenfis Go alter flore albo. The French and small w hite flowred Spearewort.

7. Ranmen'us Sardinius lantiginalis. The true Sardinian Crowfoote.

6. Ranun-

CHAP. 5.

8. Rannuculus aquat cus Hepatice facie.

Rannacalm Hederacem aquation ater Crowfoote with Ivy leaves

10. Ranunculm he derala folio aquaticm. Water Crowfoote with Ale-coaft leaves.

6. Ranunculus palustris Sardonius lavis. Round leafed Marsh Crowfoote.

This kinde of Crowfoote shooteth forth a round hollow stalke necre halfe a yard high, branching forth into fundry parts, the lower leaves whereof are more round then those aboye, and are divided, some into three, which are the first and lowest, others into five divisions, and each of them dented about the edges, somewhat like unto Coriander leaves, of a pale greene colour and smooth, but those up higher on the stalkes and branches are still more and more divided, fo that some of the highest have no devision or dent in them, at the toppes stand fmall yellow (yet Gorden faith he hath observed some to beare purplish) slowers, after which commeth a small long round head of many crooked seedes ser together, as in other sorts is to be seene, the rootes are a bush of small white

stringe: the whole plant is as sharpe and virulent as any of the other forts, here or else where described.

7. Ranuncius palustria Sardonius lanaginojus. The true Sardinian Crowtoote.

The true Sardinian Crowtoote groweth very like unto the last, but somewhat higher with such like leaves,

but more divided and hairy, like a small cotten upon them, in other things there is little or no difference.

8. Ranunculus aquaticus Hepatica facie. Water Crowfoote. The Water Crowfoote shooteth forth from a small threddy roote, a long trailing tender stalke with fundry jaynes thereat, at every one whereof that are under the water standeth divers fine jigged or feathed leaves, almost like as if they were fibres, but that they are greene, but toward the toppe those that grow above the water, have none of those fine leaves at the joynts, or very tew, but onely round leaves upon short footeslakes, cut in a little and dented about the edges, and with them come forth likewife small milke whiteslowers, of five round

leaves apeece, with fome yellownesse in the middle, after which come small rough heads like a Crowfoote.

9. Rannaculm Hederacem aganticm. Water Crowfoote with Ivy leaves.

This small Crowfoote groweth up with diversariangular leaves upon slender trayling stalkes, shooting out fibres at the lower joynes, and with the leaves which are sometimes marked with a blacke spot, come forth small leaves to the lower states of the leaves which are sometimes marked with a blacke spot, come forth small leaves to the leaves of the leaves which are sometimes marked with a blacke spot, come forth small leaves to the leaves of knots of yellow flowers likewife upon fhort footestalkes. 10. Ranna

no Remembre Helente folio aquaricus. Water Crow boote with Ale-coult leaves. This Water Coowfoote excepted likewife, and shooteth fibres at fundry joyntsof the Ralkes, whereon stand This water one was a formewhat like unto those of Ale-hoose, or Ale coast, having palish flowers, rate of five pointed leaves with roundiff heads of feed after them.

The Place and Time.

All these forts of Crowsectergrow in Moorish and wet grounds, and somewhats at the brinckes of Waters, and Ditches. The first is searce to meete with but the two next, and the two last are plentifully encugh in but places of the Land, the fourth and fifth came out of France. the sixth and seventh, are found likewise in the places, but not so troughn as the other following. They flower in May, and Lune, and give their seeder the Names.

the Greeke name gar proper, and the Latine Rannneulus, doe most fitly agree to this herbe, in that Frogges the Greeke name surgers, and an exactine transmension, does not not never expension herbe, in that Frogges bather thickelt refidence where their grow. The first is the Lingua Pliny of Lipdunens, with Thalius in Coducalled Ransuculus or Argustana, and the twelfth of Cordus in Historia, the Ransuculus standards and the twelfth of Cordus in Historia, the Ransuculus standards and Landaucus the Florence Ransuculus of Tabel and Landaucus the Florence Ransuculus the Ransuculus the Florence Ransuculus the Florence Ransuculus the Ransu interit fanumentus of Argustara, and the twelfth of Cordsu in Historia, the Randoccus flumment aquatilis interit fanumentus of Lobel, and Lugdinners; the Flummula Ranunculus of Dodonatily, the Randoccus aquatilis in the Lobel, and Lugdinners; the Flummula Ranunculus of Dodonatily, the Randoccus aquatilis in the Cordsus of Thailus, and Lanceolasus minor of Tabermontanus; tome take k to be Pliny his in the sum of the control but the annual others, and the Ranunculus painstrie apy folio levis of Bauhinus, but by Lobel, Ranunculus willing rounding of olio. The seventh is as I take it the true Sardonius of Dioscorides, described by him in the semaplic, and called by some in his time Apinus Sylvestre, and called also Rammentus Sardonius by Augustara, and the front Ranunculus of Matthiolus, and of Cordus in hift. Banbinus calleth it Ranunculus palustri Apit historinofus. The eight is called by Lobel Ranunculus aquaticus hepatica facia, and foit is generally called of allecharills with us, by Dodoneus, Ranunculus aquatilis, by Lugdunenfis Hepatica aquatica, and by Thalins Hypitapaluffris, by Bandinus Ranunemlus aquations folio rotundo & capillaceo, who maketh that other of Ca-Appendix panagers, by granter that other for the when as they are both but one, even as that Trichophyllon of Columnical olection it, Lugdanensis callech it Ranunculus Hederaceus Dalechampy, and Baubinus Lenticula quatica trisulu. The last hath not beene mentioned by any before. The Dutch call the first fort Egelacolen, because if sheepe methereof it dothenslame and exulcerate their entrals, which disease they call Egel, as Dodoness saith, some call in English Banowort, and others Spearewort. The Vertues.

The Marth and Water Crowfeete are no leffe sharpe and exulcerating, then any of the other forts of sharpe (mwfere, and therefore whatfoever hath beene faid before of the properties of them, may fitly be applyed to the, for any of the remedies there fer downe, and any of these may be used, if the other be wanting, either for Beer fores, rough nailes, warte, nicers, or any foule markes in the skinne, &c. and for previty, not willing to remethe fame things, expressed in the Chapter of Ranunculus Crowfoote before, I referre you thereunto.

CHAP. V.

Plende Alphodelus palaftris. Marsh or water Asphodill.

ere are two forts of this Bastard Asphodill the one greater then the other as shall be shewed in the subsequent discourse, for of the other Asphodills I have shewed you their forts in my former booke

although I show you here some of their figures.

1. Pleuds alphadelin major. The greater bastard Asphadill.

The roote of this greater Bastard Asphadill is long and joynted, with many fibres thereat from the plant of the greater bastard and strow leaves like unto Corne Flag, but not so stiffe or hard, and straked downers. ight, yet compassing one another as they and the Flowerdeluces doe at the bottome, of a deepe greene colour, among which rifeth up affalke halfe a yard high, with divers fhort leaves enclosing the falke as it were with bleatheir bottomes, and arthe toppes frank fundry yellow flowers as it were in a spike, each of them made of faktives speece, like the other Aspodells with some threads in the middle, after which come somewhat long and purepointed huskes with finall blackish seede in them.

2. Pfeudo affhodeless minor folio Indis angustifolia. The lesser bastard Aiphodill. This lefter Afphodill hath many narrower shorter and fresher smooth greene leaves, somewhat like unto a nar-towlested Flowerdeline, but neither so hard nor so thicke, the stalke riseth from among them scarie a foote the baring very few small leaves thereon, and paler yellow small slowers at the toppe of it, which turne into three square reddish huskes containing small reddish browne feede within them: the roote consisteth of the whitifh long fibres not spreading farre or much, but increating into fundry heads.

The Place and I see,
Both their forts have been found in our owne land as well as beyond Sea in the marrish and wet grounds, the
former not onely in Laneaghing as Gerard hath recorded, but in abvers other places: and the last likewise by flum not farre from the River fide there, and in the West parts of the Land also and in other places, slowring in me and full, and feede a mometh after.

1. P fende-afpedelm major five Paluffrie.
The greater buffard Afphodill.

Asphodelus majer albus remosus

Afplodelus luteus minor. The Kings Speare.

The Names. They are called both Apbodelus luters paluffris as Dodoness doth the first, and Pfeudo appodelus as Cinfin doth They are cancer would be a supplied to the supplied of the sup be calletn the late of the late he had out of Scotland, and law it likewife in Norway to differ from the first, per furely he is militaken therein for it is all one fort.

Wee have not knowne these used in Physicke for any purpose, but I have had intelligence from my good field Doctor Anthony Salter of Exeter that he having found it in some places neare unto him, could understand of trecounties people no other name thereof, or propertie appropriate unto it but knavery, which whether they. medit fo in knavery, or knew any use of knavery in it, I neyther can learne nor am much inquisitive thereafter

CHAP. VI.

Acorm palustrin sive Pseudoiris & Iris lutea palustris. The yellow water Flag.

He water Flag groweth like the Flowerdeluces, but that it hath much longer and narrower fadde greene leaves joyned together in that fashion, the stalke likewise groweth oftentimes twise as high, bearing (mall yellow flowers, shaped somewhat like unto the Flowerdeluce, with three falling leaves and other three arched that cover their bottomes, but in stead of the three upright leaves as the flowerdeluces have.

this is the case of the state o Flowerdeluces: the roote is longer and stenderer then of the sowerdeluce, of a pale brownish colour on the outside, and of mhore flesh colour on the innerside, with many hard fibres therei, and very barsh in taste. Lobel sheweth in his Adversaria hatthere was a great roote brought from Tholofe, which was nkm for Radix China, but deceaved many in that it was no suchthing in effect, for it was in talte altringent, and in the proofe normuch differing from the former.

The Place and Time.

Itusually groweth in watery ditches, ponds, lakes, and moores file, which are alwayes overflowne with water, as at Lambeth inteditches on the bankes fide may be yearely scene, and in many other places, flowring in Inly and ripening its seede in

The Names.

This is not less which was called isees ideft, confecratrix as Gaza translateth it, but is rather Jeudoleis Pfeudoiris a bastard brother other flockerin the former ages of our fathers it was held by masytobee the true Acres of Diescorides, to ignorantly had the woldbene trayned for many yeares, until feruples began to sifin mens mindes, not finding the things answerable to their disastons in old writers, which caused them in these later times to be formewhat more inquifite and diligent, to finde out the me and genuine plants, and give them their proper names (and bahit not fo fallen our in Divinitie thinke you as you fee it bath doe in Philosophie) for thereupon although Brunfelsius call it Mum, yet Tragus called it Adulterinus, and Cordus, Gesner, Mathiclus and others call it Acorus salfas, and Lobel Acorus Mufris, Fuchfine Turner and others call it Gladiolus Intens, but Delmem Pseudoiris, and others Iris palustris lucea which Clusius in feeking of the true Acorus faith that the most judicious take it to be the Busomes of Theophrafins.

The Vertues.

The roote of this water Flagge is very aftringent cooling and dying, and thereby below half Laskes and Fluxes, whether of

Acmvs Aquetanicus.

Acomi palustris seu P seudoiris lutea palustris.
The yellow water Flagge.

blood or humors, as bleedings at mouth, note or other parts, booddy Fluxes and others of that nature, and womens too abounding courfes a the defilled water of the whole the fowers and others of that nature, and womens too accounting courses of a squared with the fowers and rootes is a foveraigne good remedy for watering eyes, both to be duringed into them, and to be clothe or founds wetter therein and applyed to the forehead, it also helperhate specially specia lime also helpeth such foods nicers as happen in the privy parts of man or woman or elie where.

CHAP. VII.

Tuffilago. Coltsfoote or Folefoote.

Oltsfoore shootethup a stender stalke with small yellowish slowers somewhat earlie, which fall away quickly, and after they are past, come up somewhar round leaves, yet sometimes dented a little about the edges, much leffer, thicker and greener, then those of Butter burre, with a little downe or freefe, over the greene leate on the upper fide, which may be rubbed away, and whitish or mealy underneath: the roote is small and white, spreading very much in the ground, so that where it taketh, it will very hardly be clenfed from it againe, if any little peece be abiding therein, and from thence fpringing fresh leaves. The Place and Time.

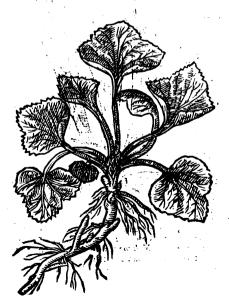

It groweth in wet grounds usually, yet as well also in the dryer places, and flowreth in the end of February, the leaves beginning to appeare in March. The Names

It is called in Greeke sayer, and Tuffilage in Latine, a notifima utilitate quam pre ophthalmicis to tuff ver-atis, and in the Apothecaries shops Earfara, and Ungula Caballina, and of some Populage, from the likeness of the leaves unto the white Popler leaves: many suppose that this may be Tiphyam of Theophrasim, at well as the Petalites, in that both of them bring their flowers before their leaves: Pliny calleth it Farranam, and Farragians: All Authours call it Tuffilago, but Camerarius maketh three forts of Bechium, that is this and the Perafites, which be calleth Tuffilago major, and the third he faith is the Caltha palastris, which as he thinketh may beused instead of Tufflings which is afturedly a great errour, the Catiba comming neerer to the nature of Ranmenlan, then Tufflage. The Italians call it Farfara, and Farfarella, and Vugbia di cavallo. The French Pai de cheval, and Paftafae. The Germanes Brandat lettich quasi V stulorum latituca, and Rosbiab that is, Vugula Caballina. The Dutch ties bladeren, that is foote leafe. And we in English Folefoote, and Coltsfoote, and Horse hoose. The Vertues

Coltsfoote while it is fresh is cooling and drying, but when it is dry the cooling quality which remained in the moilture, being evaporate it is then somewhat hot and dry, and is belt for those that have thinner theumes and distillations upon the Lungs causing the cough, thereby to thicken and dry it as the fresh leaves or juyce, or Syrup made thereof, is fittelt for an hot drycough, and for wheelings, and shortnesse of breath: the dryed leaves taken as Tabacco is in the like manner good for the thinner houmes, distillations and coughes, as also the roote raken in like fort as Dioscorides and Galen say. The distilled water hereof simply or with elder flowers and Nightshade is a fingular remedy against all hot Agues, to drinke two ounces at a time, and to have some clothes wet therein and applyed to the head and stomack, the same also applyed to any hot swellings or any other inflan-

Tuffilago Herba fine flore.

Tuffilago florens. Colts foote in flower.

nations doth much good, yes it helpeth that diffeate called Saint Ambonies fire, and burnings also, and is singuised to take away wheales and small pullies that tife through heate, as also against the burning heate of the about of the privy parts, to apply wet closues therein to the places. Maisbiolas sheweth that in the roote of the Colts foote there groweth a certaine Corresponding which being clensed from the rootes and bond up in linner clothes and boyled in tye for a while, and afterwards some salt niter added unto it, and drydup agains in the Sun is the best tinder to take sire, being stroke from a fint that can be had.

CHAP. VIII.

Cacalia. Great and strange Colts foote.

F this kinde of Colts foote as I may fo call it there are two forts described by authors which I means to shew you in this place, and unto them adde another American plant which in my opinion commeth nearest unto the others.

In Cacalia isoane retundo felie. Hoary strange Colts sqote.

The hoary strange Colts soote hath a long white roote divided into many heads, with many long lings and fibres thereat. of a clammy take like unto gum Tragacans, encreasing thereby much and shooting up many bory reddish striped stalkes, with large round leaves on them, bigger and thicker then Colts foot, and more woolly also on the upper side, yet with a greenenesse to be seene in them, but very woolly and white undenth, with some righes and veines in them of a little bitterish unpleasant taste, from among which rise up the depath, with some ribbes and veines in them of a little bitterish unpleasant taste, from among which rise up the single woolly yet reddish falkes two or three foote high, having fundry lesses on them, and all of them standard the edges, branching forth at the topic into sindry single pale purplish sowers made of time said leaves a peece, with some threes in the middle, which after they have been a while blowne doe passay into downethat is carried away with the winde. Dakethampins saith that in the middle of the flowence found hanging downe small white graines like pearles to make it answers to Plinies description.

2. Cacalia glatore folio acuminato. Smooth strange Colts score.

This other fort hath as large leaves as the former, but thicker harder greener and smoother and not hoary at albut dented or waved on the edges, and pointed also with the roundnesse and smoother the stalkes as the standard of the stalkes are in like manner smooth and stringed. Bearing the like flowers at the coppes but somewhar new the stalkes are in like manner smooth and stringed. Bearing the like flowers at the coppes but somewhar new the stalkes as the standard standa

oter, the stalkes are in like manner smooth and striped, Searing the like flowers at the toppes but somewhat paer: the roote also is alike.

1. 2. Caralta felie incano rotundo Co Elabro acuminate. Hoary and Smooth Asange Colts foote.

Cacalia Americana. Colts foote of America.

CHAP. 9.

3. Cacalia Americana. Strange Coltafoote of America.

This stranger riseth up with many round stalkes about a yard high and two somewhat round but pointed level. This stranger riseth up with many round stakes about a yard night stranger riseth up with many round stakes about a little dented about the edges, at each joynt of them, the upper leaves being smaller, and little or nothing dented, at the toppes of the stakes come forth divers branches with pure white slowers, divers small ones, made of five at the toppes of the stakes come forth divers branches with the pure with the state of the at the toppes of the stalkes come forth divers branches with pure white the version of ones, make of five leaves appece, rising out of each huske, which being past, there specede small long seede, sticking each past little downe, which are carryed away together with the winde: The roote consistent of a both of blackish three or downe, which are carryed away together with the winde: The roote consistent of a both of blackish three or flower, which abide the extremity of the Winter, both stalkes and leaves perishing yearely, but grow browning fibres, which abide the extremity of the Winter, both stalkes and leaves perishing yearely so ut grow browning the property of the winter perishing year lease, not shower. nores, which added the extremity of the vy interpolation in roots, leafe, nor flower, what foever Coments at the end, this hath no fent that I could perceive, neither in roots, leafe, nor flower, what foever Coments fish thereof. The Place and Time.

The two first forts grow in the vallies of mountaines in fundry places beyond Sea, and by the Bather, where The two hit torts grow in the values of imparations as yet I can heare of, and flower and feede in the Summer they want not moisture, but not in our owne Landthat as yet I can heare of, and flower and feede in the Summer time: The last in America, both Virginia and Canada.

It is generally taken by all our later Writers to be the wife hoe hours of Disferrides, which Galen calleth Can It is generally taken by all our later withers to bettle mentioneth not Caealia as Dieferrides bath is, yet given the same properties to Cacanum, that Dioscordes doth to Cacalia, which is not usuall with him, unlessed the means the same properties to Cacanum, that Dioscordes doth to Cacalia, which is not usuall with him, unlesse he means the same thing. These plants are called by no other name then Gacalia by any Writer but Lagdaungs, who called the scool Tussia plants for montant Dalechampy. Bankins would make a third fort of these European kinds, but I finde his description so answerable to the first fort, that I thinke it is the very same, and therefore give no further description of it. The last I acobus Cornatus calleth Valeriana Vreica folio flore also, because he had not there of that fort with a purple flower, saying the roote smelleth like Nardes or Valeriana. But I can find so such thing in it, I have called it great and strange Coltessore, and not mountain Coltessore, as some have done, because there are other herbs more properly to be called Mountaine Coltafoote, which grow alwaits on the dryer grounds. as shall be shewed in due place, and these in the moister parts of the mountaines; and because the slower are white and stand like a Valerian. I have therefore as I thinke added it to these Cacalia. For by that same did Master Tradescant receive it first from beyond Sea, of whom I received the plant that groweth with me.

The Vertues. The roote steeped in wine and eaten is good for the cough, and the hoarsenesses of the throate, which Galer confirmeth saying the same of his Cacanam, that it is without sharpenesse, and good for the hoarsenesse. Distributes addeth that the Pearelike graines which are found in his Cacalia, beaten and mixed with a terote or ointment. doth make the skinne smooth, and will stay the falling of the haire as Pliny saith.

CHAP. IX.

Lappa five Bardana. The Burre Docke.

E have three or foure fores of Burres some greater then others, and some with more woolly heads, as also a strange American fort. 1. Bardana major vulgaris. The common Burre Docke.

The common Burre Docke bringeth forth many large hard greene leaves, somewhat like unto the Butter Burre or wild Docke, but more crumpled, and of a darker greene colour on the upper fide, and and fomewhat grayish underneath, among which rise up hard and rough greene stalkes, two or three footchigh with many the like but leffer leaves on them, and many branches alfo, bearing at their toppes divers rough heads with many the like our lener leave on themand many oranches and, tearing at the toucheth it, cut of the or burres, with crooked pointed prickles, apt to flicke on any garment or other thing that toucheth it, cut of the toppe of each of them come forth many hard purplift threds, which are the flowers, with thatter they are fided and paft, turne to downe in the heads, and opening themselves shed their grayish seeds, itself of the Knapweedes, which together with the winde is often carryed away, and often falleth downe on the ground, the roote groweth great and thicke, blacke on the outfide and whitish within, sweete and pleasant in talte at the first, but somewhat bitter after. We have had from Virginia, and those other Northerly parts, another sortheres, whose Virginia. leaves are rounder and smaller, and the burre smaller, harder and with very sharpe hard crooked points, strongly sticking to what it toucheth.

2. Bardana major roses. The Rose Burre.

This Burre differeth in little or nothing elfe from the former, but in the head, which initial of the prickely burres hath many small greene leaves, set together like a small Rose Plantaite, and but fittle prickly at their

3. Bardana major lannginosis capitulis. The woolly headed Burre. This also differeth little from the first but onely that the leaves grow not altogether so greet and the heads being

fmaller are woolly all over, and the prickles not so sharpe or sticking.

4. Xanthism feve Lappa minor. The small Burre. This small Burre riseth up with a rough crested stalke, about two fooce high, with many bleckish spot upon them, breaking our into fundry branches, with two much smaller and white; leaves at every joints. Standing upon long footestalkes, divided into three parts usually, somewhat like unto a Marsh whilely leave, unevenly dented about the edges: at the joynts of the stalke and branches with the leaves towards the copies of them, come forth small slowers which shids not be the stalke and branches with the leaves towards the soluted at the forth small flowers, which abide not long, and after them two or three small close burres, a little pointed at the toppe, wherein lye two or three small lancke seedes somewhat like unto an Oate which fall not out, nor doether them the course of the cours

heades open: the roote is small somewhat long and sbrous, perithing yearely.

The Place and Time. Some of these grow not in our Country that I can learne, but neere Linfwicke in Germany, which is the Role Burre, the ordinary is plentifull enough with us by dirches and water fides, and the high wayes likewife, every Bardana major dulgaris.

TRIBE 14.

4. Zenthium five Bardana mixor. The leffer Burre,

where, but the two last are not so frequent, yet are found in fundry places, and the last in two or three places betreene Tidenham, and Chepftow in the toote way.

his called in Greeke dounor Arcium (and not Arctium, for that is Arcturum a plant with leaves like Blattaria. whereof I have entreated in the first Classic of this Worke and the 22. Chapter:) in Latine Personata, and Lappa. binany; it is called Bardans in thoppes. The first is called Personara & Lappa major by most writers. Dodoness ched it Bordana five Lappa major. Baubhitu Lappa major Arcinum Diofordia. Trayis putteth it inter vitia her-less, as he and others doe Latium and the like inter vitia fragum, thinking belike that this is a degeneration tomother good Herbes, by reason of the burres, as Cardui and Tribuli be also accounted as they thought, which sucrour intollerable for Christians to averte, who doe or may learne out of a criter Schoole then Galen, or the lames could, that the sinne of man ranged Sood to curse the earth, and to cause it to produce Cardon and Tribumuster are translated, as feverall kindes of herbes, even as Lolium and the reft are, and each feede bringeth forth nowne kinde, according as God appointed it in the beginning, from the restriction of libest fall at the least. The kind is remembered onely by Bankinin, under the title of Lappa major of ea. The third is called by Marthiolus, losses five Lappa major alsors, and thinketh it to be the Persolate Ring, for he make the mention both of Persolate Persons in the same Books and Chapter, and Lobel called it Arthing who position in Persolate Pling, leading all the last and the la loud Personnes in the same Booke and Chapter, and Lobel callett it Arctions morphania in Personne in Personne in Substitution of the Control wound to like one to another, and the description of Arcium and Arcium in Disjourity. So differing both in the fede and roote, I doe wonder how he can make them to agree. The last is allured by the Xuntoinum of Disjourity, the Suntoinum of Disjourity, and the last of the Suntoinum of Disjourity of the Suntoinum of S

The Versus.

The Barre leaves are cooling, and drying moderately, and discusses with all as of the last, whereby it is good to heale old Vicers and fores: a dramme of the rootes taken with Pine kernesses of the their that spit foule natury and bloody flegme: The leaves applyed on the places troubled with the fhrinking of the finewes or artries give much eale: the juyce of the leaves, or the rootes rather themselves, given to drinke with old wine Mmmmm 2

and an early

doth wonderfully helpe the bitings of any ferpents, as also of a mad dogge, and if the roote be beaten with a little falt and laid on the place, it will suddenly ease the patient of the paine; the juyce of the leaves taken with bony doth wonderfully helpe the Sciatica: the leaves being bruised with the white of an egge, and laid on any place burnt with fire, doth take out the fire, giveth suddaine ease, and healeth it up afterwards, the decoction of them fomented on any fretting fore or cancker, stayeth the torroding quality, which after mult be amointed with an ointment made with the said liquor Annagia, niter and vinegar boiled together. The rootes may be preserved with Sugar and taken fasting, or at other times for the said purposes, and for Consumptions, as also for those that are troubled with the stone or laske: the seeds is much commended to breake the lone, and cause it to be expelled by Vrine, and is often used with other seeds and things for that purpose; The lesse burne seeds as Galm saith have a digesting quality in them, and are hot and dry, and themely good to assuage tumours, the seeds of the roote bruited and often imposed on kernels or hard knots in the self-oft hose sides themely seed to the roote made with wine, helpeth to consume the hardnesses of the species. being someted warme on the place: the burres being gathered before they be ripe, bruised and lixid to theepe in warme water or wine, and the haires moistened therewith, after they have beene rubbed with a little niter doth make them yellow. haires moistened therewith, after they have beene rubbed with a little niter doth make them yellow.

CHAP. X.

Lapathum. The Docke.

He Docke is of a large extent comprising within it fundry forts of herbes: some whereof are fit to be planted in Gardens, as being rare and worthy plants, and therefore worthy to have some care and paines belowed on them, which are entreated of in the second Classia of this Worker others belong to the Kitchin Garden, as fit for sawce and meate, and suchare the Sorrela which are called sowre Dockes, spoken of also before in the fixth Classia of this Worke, and some are found in the feldes and wet places where they grow, which shall be described in this place. Ynto shele also I might adde all the forts of Spinage, if I had not set them forth in my former Booke, or were of Bashisms minde, that they belonged to this

family.

I. Lapathum acutum majus. The Red Docke.

The red Docke from a great and long blackifh roote on the outlide, and formewhat reddiff and yellowifh within sendeth forth many long hard and narrowish greene leaves, more pointed at the ends then in other sorts, among which rifeth up a fliffe hard flalke, three or foure foote high, fet with the like leaves, but smaller still up to the too.

1. Lapathum acutum majus. Tiered Docke.

3. Lapathum acutam mirimum.
The imalieft pointed Docke.

7. Matelanathan majus?
The greater Water Docke.

1mmmm 3

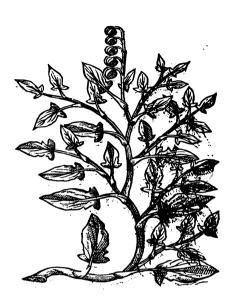

8. Hydro lapathum minus. The leffer Water Docke.

and

9. Lapathum maritimum Fatidum. The firong fented Sea Docke.

and brancheth forth into fundry fprigges, bearing small reddish flowers, and browne triangular seede after them.

2. Lapathum acutum minus. Small sharpe pointed Docke.

The roote of this Docke is long and slender, parted diversity with small fibres therear, and of a yellow colour on the infide, the leaves are narrow and long waved in on the edges, as if they were compled, the stalke and slowers, with seede following, is like unto the former, but that they stand not on sheat long sprigges, but cloter

together, some at the joynts, or compassing the stalker, and others at the toppes, and of a caker colour.

3. Lapatigum acutum minimum. The smaller pointed Doctor.

This small Docke differeth little from the first, for forme and manner of growing, but in a capacitation this being much imaller and lower, the roote is small and more yellow.

4. La pathom filvefire uniquime. The Common wild Decke.

The common Docke that groweth every where different little from the Garden Docke on Batience, but that the leaves hereof are somewhat broader and rounder at the points, and the rootes more wild the points.

This roun Docke is very like in the leaves unto the other round leafed Docke, mentioned in the fecond Classis before, in this worke, but somewhat thicker, the stalkeriseth higher, the shower is arresult, and the roote is somewhat round like unto a Turneppe, but yellow both within and without, the white short in the stalkeriseth and without the stalkeriseth and th reof is sweetish without any other thanifest raste, and is therefore not cold as the other Docker are, but hor in the firft degree.

the fift degree.

6. Lepathurs untisofum five bonus Henricus. Englife Mercury.

1 mest needes put this herbe among the Dockes, according as the best Herbarista days, rather, then wild Arraches, as some others buye done, and shew you that it bath divers broad and Jong thickes free greene leaves, upon long stalkes, pointed at the bottomer, formwhart his quays correlate stakes are many, two foote high, full of leaves, and at the toppes many spikes of greenish sources, and ster them, the roote is thicke great and long, and yellow like a Docke: the whole plant is of the oversigned with. a mealy dust, like unto Arrache, which hath caused divers to referre it to them.

7. Hydrolapathum majus. The greater Water Docke. This great Water Docke, groweth very like the common wilde Docke, but greater and higher, with larger and ionger leaves, and not to round pointed, the rootes also are shorter, and fuller of fibres, and of a darkered colour.

8. Hydrolapathum minus. The lesser water Docke. Theleffer Water Docke tath leffer leaves, long and narrow, and lower stalkes, fuller of branches, with flowers and fredes like unto the rest of the Dockes, and so are the rootes like wife, but smaller and full of long stringes and fibres. 9. Lapathum

9. Lapathum maritimum fætidum. The strong sented Sea Docke

Recause Banhinum putt the this herbe among the Dockes not knowing belike whereunto else to referre it, even Beaute Daniel I fee more of it, and fay with him that the stalke is reddish, a foote high and bending divers waies: familt I unter the frand on long footeflakker are fomewhat round, and of a darke red colour, fometimes waved about tedges, and winged usually at the bottomes, or with two small peeces like eares: the stalke is parted into may branches, with the like but lesser leaves on them, and a little dented about the edges: at the toppe of the like standeth a spike of flowers, composed of source mossile leaves a peece, after which follow leased round heads, metaining the feede.

10. Lapathum fanguineum. Bloodwort. This Dacke, because it is often used as a pot-herbe is planted in Gardens, yet found wild also, having reddish log kaves, or greenile with red bripes, the relt of the plant comming neetelt unto the red Docke, but imaller as log Karms of the proof is also, yet not lo reddish. Cafalpinus mentioneth another fort hereof, with broader and rounder rubum

The Place and Time. all thefe Dockes except the fifth and the ninth, grow in moilt and wet places on the Land, and thofe other in the places neer the Sea, that of Africa neere Sophia, and the other neere Mompelier: And beare feede in the and of August at the furthest, and some earlier.

The Numes. It is alled in Greeke Admitor amore hand on amode and the same of proventrem levere usurpatur, the word intuited by Aristoth, lib. 2, Physic flow in Saddient in hand of week it, id est verbiggation ambulare, siest alwider washing and Lapathum also, and Rumen in Latine. The first is the Oxylapathum of Disserties, and so called by Fuifin, Matthiolus, and others, but it is not the Oxalis, for Dioscoridis doth distinguish betweene them, the by rangem, vizas repaired, and coulers, out to a notate orange, not Disjersing dott dittinguish between them, the outloom the fower juice, the other from the sharpe leafe, for two is referred both to the taste and forme. Coldus a Disjersides calleth it Runner acustus, Tragus, Lobel, and Dodonam, Lapathum acutum. The second is called by Publicu. Lapathum acutum folso crispo, as Tabermontanue did, whose figure Gerard used and called it Hydrolipa. the minist. The third is fo called by Lobel, as it is in the title. The fourth is called Rumen agressia by Cordun. and Londown felio minus acutes, or resufe by Lotely Hippolapathum filvestre by Tabermontania, whose figure Gerard magnituded it Hydrolapathum magnium. The fifth was brought us out of Africa by Beel, who for the likenesse of the magnitude of the magnitude it is in the title, which we have continued, not knowing where the mplace it, until we have further knowledge of it, then of the dryed plane which he brought. The lixt is until the lixe is denplace it, until we have intener knowledge of its then or the dryed plane when he brought. In a like is the influence of the dryed plane when he brought. In a like is the influence of the like is the like of the like is the like is the like of the like is the like of Emplayathum Sylvefire, Lobel and Lugdanenfis Hydrolapathum magnum aquaticum or majus. The eighth is called Birilgathum minus by Lobel and Legdunenfis, and not fativum as Bauhinus fetteth it downe in his Pinax. The inhiby Banhimu his appellation so called as it is in the title The last is called Lapathum nigrum by some, and inhanot rubens by others, Sanguia draconic herba by Gesner in hortin, and Lapathum sanguineum by Lobel. The Athiest call the Docke Humsalb, and Hamad. The Italians Rombice and Lapacio. The Spaniards Labafa, and Irakla. The Frencis Parcillo. The Germanes Ampffer for the generall word as Samr ampffer for Sorrell. The Puth Paich and Passack, And we generally Docke, and then adde the feverall denominations as fower Docke a Sond, wilde Docke, Sandem Docke, Sec. The English Mercury is called by the Germanes Goster Henrick and Iduards, The Dutch Garden Henrick and Lammekens bore. The French Herbe de Charpentier.

All the force of Docker have a kind of cooling but not all alike drying quality, for the Sorrels are more cold then systite reft, and the Blood were more drying but the feedes of most of them be drying and binding: some of tembesides the Socress were stored were used to the most interest were stored or boyled, and for the most interest were stored or boyled, and for the more easily passe through the belly, without giving eigenstances. trung greaner good mouriflement fewings midifure to the body. The feede of most as I said, either of the funds of the fightes, declaring limits of all fort, and the subversions or loathings of the stomacke though choller, and in as helpstill trained that spirithood. The rootes likewise of the most of them except the list of Enhantement the soil Docks are drying and binding, conducing to the same effects aforesaid, but all they be no graning quality in them if to do list in the best of the same and the soil of the same and the between the country of the country o The Mirrory as it is called or good More the receive and cleening the herbe is mollifying and loofenby prelimpfithe frameling smooth flipperine file there is drying and cleening the herbe is mollifying and loofenby prelimpfithe frameling smooth flipperine file there is taken inwardly, but applyed outwardly to woundes
by the first of the least flexibility of the least flipperine file is the first of the least flipperine flipperine for the properties of he Rabarbes, and the Sorrelmant Deverally declared before in their proper places.

CRAP. XI.

Raphanus palustria five aquatieus. Water Reddish.

Here are two forts of herbes entituled Water Reddishes, which I must therefore here set together, and thew you which they are.

The Water Reddish riseth up in the water with slender weake and bending stalkes, yeelding to and The Water Readily rifeting in the water with the water water with the water water with the water made of foure leaves a peece, after which follow small and almost round pods with round seede in them; the made or toure leaves a peece, after which follow imail and airious round pous with round feede in them; the roote runneth in the mudde, shooting out fibres in fundry places. I have thought good to give you both Bankings his figure hereof, which he saith is more exact then that of Lobels, and Lobels also but surely Lobels life, as both he and I have seene such growing, it seemeth that Bankings his figure is of another fort, being to the 2. Raphanus aquations alter. Another Water Reddish.

This other Water Raddish groweth more upright, in that it seldome groweth in ponds of water, as the other doth, but in or necre watery ditches to be a yard high or better, with fundry stalkes rising from a long tough white roote, with divers strings and sibres thereat, whereon are set many long leaves, much some or cut in on both edges, at the toppe of the stalkes stand large tusts of whitish or purplish flowers, which turne into short pode and feede in them, not fo round as the former,

The Place and Time: The first groweth never but in waters or brookes, or where store of water is continually, the other as well in bottomes neere the waters as in finall watery dirches sometimes and flower after Midsommer, the seed ripening above a moneth after.

The Names. The fielt is called Raphanus aquatious by Tabermontanus and Gerard, and Banhinus addeth in profundas lacinias divisiu, (who taketh it may be the Raphanus of Theophoff us, that is like to Rocket) and palaffri by Lugdanenfi, Lo. bel calleth it Raphanus sylvestris officinarum aquaticus, and Dodonem Radicula sylvestris. Casalpinus called it Si. Symbrium Sylvestre. The other is the Rapistrum aquationm of Tabermontanus and Gerard, which Banhinu calleth

> 1. Raphanus aquaticus Lobelij. Lobels Warer Reddiffi.

1. Raphaneus aquaticus Banbini. Water Reddish of Banbinus.

Raphanus

leham aquaticus alter, for finding it did been agree with the Reddish then with the Charlocke, he altered the title as I here edere it unto you:

Tri BE 14.

Neither of both these are properly used Hylicke that I know, yet they both deforewhat hot in the mouth, and the hor Water Raddish more then the o-der, and therefore I thinke may be used ber, mu meretore I thinke may be used intelled of Horse Raddish, to warme tolk sometice, and to belpe both to proper mine and to expell winde, for which pupole, the feede is more effectuall them the bene, and the roote of more force then the leede.

2. Rephane Paluftris alter. Another water Raddifh.

CHAP. XII.

Vaccinium palustre. Marsh Whortes.

Arth Whore, hath findry flender brownish branches like threds, scarse a foote long, creeping upon the ground, and rising from a long white roote, that groweth allope and not downeright, beset with many small leaves like those of Time at certaine distances, greene on the upper side, and hoary undermeath oftentimes, the flowers rise out from the toppes, set upon long threddy footestakes, considered of five reddish leaves, with an umbone in the middle, which turne into round reddish berries, bund with fine small spots and prickes, with some lancke seedes in them, the berries have a sowrish talle, and the layer are aftringent. The Place and Time.

l'groweth in Moorish places, where it is often covered withhoffe, and flowreth in Isly, the berries being ripe in

The Names.

Delman and Lobel, call this Vaccinia palustria. Gefner in min, Refa Alpina calleth it Acinnaria palustria. Cordus whishillory Fol, 140. Oxycoccum : but Gefner doubteth it whe mother fort fromthis, and Baubinus Vitis Idaa palufridying it is the third Vitis Idea of Clusius, wherein he is manifester, for he doth but onely, name it there, and something that it is the fame, as any man that readeth the seemy easily understand.

The Vertues. Design faith it is good against hot agues, and quenchthe thirst in them, and the heate of choller: it stayeth vomitings, and restoreth a decayed stomacke, that hath lost the appenie by corrupt humours, and doth refift pestilentiall disDactinium baluffre, Marth Worts.

CHAP. XIII.

Marrubium aquaticum, Water Horehoned.

Northe Water Horehounds I must adjoyne two or three other plants, neerest thereunto bothin face and place, which I referved out from the former Horehounds, to fet here. 1. Marrubium aquaticum vulgare. Our ordinary Water Horchound

This Water Horehound groweth formewhat great and high, with strong square stakes, having ges, not hairy or rough at all, but smooth and greene: at the joynts with the leaves towards the topper, small white she should strong the strong strong at the strong strong and round, source usually set together in the huske: the roote is a tust of blackish strings.

2. Marrhbium aquaticum alterum. Hairy Marsh Horehound.

This other Water or Marsh Horehound hath square stakes, but hairy, and a little hoary and rough, whereon are set leaves by couples, as in the sormer-shairy hard and hoary, much more cut in, on the edges, even to the middle which making them seeme like the leaves of the great Mountaine Scablous, the ends being pointed and those.

are fet leaves by counters as in the commission of the great Mountaine Scablous, the ends being pointed and thape: the flowers are white and final, flanding in rough sharpe pointed huskes compassing the stalkes at the joyats, as the former doth.

the former doth.

An explaint weigram feridam Ballote diffum. Stinking blacke Horehound.

The flinking blacke Horehound thath divers topare blackifth hairy greene stalkearising from the roote, whereon are set upon long sootestalkear compassing the stilke say still of veines, a little hairy, and endented about the edges, similing somewhat strongly, two all values at a jount: the flowers are gaping and of a purplish colour, somewhat like the red dead. Nettle, in greenish hairse compassing the stalkes as the others doe, the seed likewise is blacke and round, and some settle transfer in the stalkes as the others doe, the seed likewise is blacke flowers, in the way to stocket white a miletrony grower labeles that the flowers, in the way to stocket hairs, a miletrony grower sad labeles. Candy blacke Horehound.

This blacke Horehound of candy, hash the single of the white Horehound, dented about the edges and share pointed, as big as those of stalme, and of so stalke account as it may seeme to be so coloured or dyed by art, and so are both the square stalkes, and the pappy like leaves but lesser that grow together, at the severall joynts of them, up to the toppes, where the stone compassing them, being in forme like unto those of Horehound, but blackish also, it is wholly without size or rather.

aquatics. in the like watery places, the leaves will be fometimes much leffe dented or jagged on the edges then in others, the flowers likewise stand not but one on a stalke for the most part and yellow.

The Place and Time.

The place is declared by the titles and description, and their time of flowring and feeding, is the end of Som-

The IN ames.

. The former is the Conyes aquatica of Gefuer in borting Conyza maxima ferrati folia of Thalim: Lingua major Dalechampy of Lugdunents, called Confolida painfrie by Tabermontanus, and Solidago Sarfaenica by Gerard, according to his figure, but not description. The other is called Conyza aquatica both by Thalius and Banhings, and that which hath more jagged leaves may be also the Conyza Helenitin falys laciniatin of Lobel.

The Vertues.

This is as effectuall a wound herbe as any is used, and is also as availeable to all the purposes that the other Comyza's are applyed, whereunto I referre you for brevities fake.

Conres pointris. Mach Fleabane.

CHAP. XVI.

Oenanthe aquatica, Water Dropwort.

Live are two forts of this Water Dropwort, a greater and a leffer, both which are exhibited by Lobel in his Icosel, under one title as one would thinke, but diftinguished the one by Ocasalte agastica, which is the lefter, the other which is the greater, by Ocasalte quarta Manbioli, but confounded in his Observations, both title sbeing referred to one, which confusion I would a void, and show you them both distinctly. The greater hath divers large spread leaves next the ground, and lying thereon cut into many divisions, somewhat resembling Parsley, but much smaller, among which rise crested thicke hollow stalkes, with leaves on them, cut into longer and siner divisions, bearing white showers at the topose which turns into longer much seeds. Somewhat lesser then

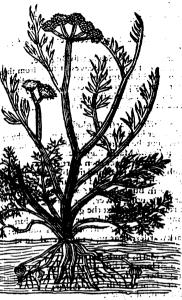

ring white flowers at the toppe, which turns into close umbels of small flat grayish seeds, somewhat leser then Fennell seeds, the roote hath sundry small white knobs growing among the strings.

2. Ornanthe aquaticaminer. The leffer Water Dropwort. The leffer hath very finely cut finell leaves lying on the ground, before the fialke beginness to rife; which then being carryed up with it fearfe feeine to be leaves but rather like the ribbes of leaves, of a darke and shining greene colour, as the stake is also, which resembleth a Rush very mearely, and below the toppe thereof, which is pointed like a Rush; (and not at the toppe as the figure expression breaketh forth a small umbell of mall which support the colours.) fweete flowers, which turne afterward into as fmall feede as Smallage but blacker, the roote hath many small kernels among the fibres, which are as small as haires or finer.

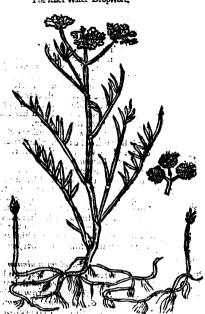

3 Ocnanthe altera miner Africana. The Guall Water Dropwort of Barbary. This other leffer fort being brought is by Beel from Barkery doch motherterly refemble the last small fort in the

6. Limonium Africanum claims er homile.

CHAP. XVII.

Limonium. Sea Marsh Buglose.

E have divers forta of this Limonium to thew you, fome whereof have beene fet forth by former An-

E have divers forts of this Limonium to thew you, tome whereof nave beene let forth by former Authours, and former by none other before now.

I. Limonium majus vulgatius. The greater ordinary Squ Martin Bugloffe.

This greater Limonium hath fundry faire long thicks or fair green leaves, riting from the toots, formewhat like into finall Bacte leaves, from among which spring divers brittle asked falks, without leaves, neare halfe syard high, branched at the toppes into thingty parts, whereon fland many finall blew-ish purple flowers, all on one inde for the most part, formewhat like unto Bugloffe flowers, but finallet, after which the purple flowers all on one inde for the most part, formewhat like unto Bugloffe flowers, but finallet, after which come long reddish feede inclosed in the backes, that the flowers flood is before the most content of the life for the flowers flood in the backet shall be formed to the life for the flowers flood in the life for the flowers flood in the life flowers f and long like unto a small red Beere route.

2. Limobium medium Anglicum. The Colchest Marsh Baglosse,

This other fort is like unto the former burleffer in leaves, and lower in the lates, being little more then a foore high the flowers are of the fame golour wish it, and almost as great, but the burlef being redding amuch lesse, high the flowers are of the same polour wish it, and almost as great, but the burlef burleft.

31. Limbusium Market sparoum. The small French Marks Burleft.

This small French fort, hat haven the surface that he had been been the last, being high street heaves, lying next to the ground but those on the stables, which are about a foote high, are the stable of the little smoothed of Sampire, the flowers are smaller elember other, but else like anto them both street in the stable of Limbusium minimus felix cordatis. The small Marsh Burleft of Limbusium list will different little from the last, but in growing sawer, were above this tackes high the most, having a tust of small chickes smooth, and somewhat round the same of them beat the most, having a tust of small chickes smooth, and somewhat round the same of them beat having a sufficient little from the early as in the same of them beat having a cust of small chickes are some higher and lower then officer burleft. Here have a harry as in it ing not pointed at all, and others having a dentiat the end, making their likes be theme of a harry as in it ing not pointed at all, and others having a dentiat the end, making their shows a more than a manuface of small redding where they spread into sundry small branches, bending a little backwarder, bearing a mather of small redding showers. 4. Limonium minimum. The smallest Sea Marin Busioline

This least Limonium, is scarle foure inches high, having from a small bong reduction parted as the toppe into sundry heads, a number of small far roundith leaves thicke for together, in the most and intelligence of a small House-leeke, the flowers are few and small that grow on the small talke, of a faint reduction between the small that grow on the small talke, of a faint reduction between the small that grow on the small talke, of a faint reduction between the small talke, of a faint reduction to the small talke. 6. Limonium Africam, Seamarth Bugtoffe of Africa.

Of this fort there are two or three differences, one low, scarse an handbredth high, whose slake is winged, like

1. Limonium majas valgatim The greater ordinary Sea Marth Bugloffe.

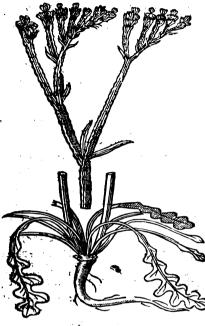

. I a Limetion Narbonen e sarvate. The finall Freesb Marth Bugloffe.

Limonium peregrinum Ranwolfij. Sea Marth Bughtfe of Syria or Spaine

7. Limanio corgener Clufij. ho tollow trafed frange plant.

untothat of Rauwolfins, having leaves on one part and bare at another, which leaves are not long, or indented like it, but somewhat round and a little waved as it were on the edges. Another fort groweth halfe a yard high, with the like windy, and the like leaves on them, as this other lefter the flowers of both forts are of a pale blew colour descents. that of Ranwolfiss. Both these forts we had from Both as formerly mentioned, taken from the fight of the dryed herbers bots which were initialed Lychnitis Committee by the free following the following which were initialed Lychnitis Committee following with mainim Fernle folio, but because neither of them in thing with us, we can as yet fay no more of them. 7. Limonio congener Clusion
The hollow leafed strange plant of Clusion

The hollow leared triange plant of the like are fillowed from the like are fillowed from the rene in any other that we know gradient, for they, are nine or ten or more, rifing from the head of a freely and the like are nine or ten or more, rifing from the head of a freely and the like are nine or ten or more, rifing from the head of the like are nine or ten or more, rifing from the head of the like are nine or ten or more, rifing from the head of the like are nine or ten or more and the like are nine or ten or more nine are nine or ten or more nine are ni rouc, each by it felfe, being small below, and ignored the trupward, with a belly as it were bunching forth, and a bowing backe, hollow at the upper end, with a peece the ton the shape, and like unto the flower of Ariff on this in Bitth-

adappe, and like unto the flower of Ariffore his of Birth wor, and round at the mouth like a halfe circle, in life of great dark purplish veines on the inside: the whole the is in of a thicke substance almost like unto leather among the ways for any at the way broken short of, so that thicke substance almost like unto leather among the ways for any at the stand from Paris, by one that received what shower or seed it bore could not be obtained. The ways for a way for a way from the print of the standard when the print of the standard when the work of the standard when the work of the standard when th dish seede vessell.

th seede vessell.

The Place and Tome.

All these forts grow in the wet fieldes neere the Sea, None in our owne land, as the first an isecond, the other three next them in France about Mompelier, and Marfelles, and Ligorne alfo, the fixt African kinde, and the other for thereof, were brought us by Boel often before remembred, from that part of Africa that the Spaniard doe N nnnn 2

Limonium Lychnitis to vaatie felio & Limer ium Finle 10hold about Sophia, and those parts, but the other two forts there mentioned, her gathered in Poringal. The last came affured from the West Indies, for so it was signified by him that sent it, but as I have shewed you in Figure 16. The rest slower in the end of Summer, and their seeds ripeneth not long after.

The Names.

It is taken to be the Anjuanov & reverness of Disserides, in Greeke so called because it groweth is rained the rights vel patastribus, and Limonium also in Latine. The first is most frequent as well beyond Sea, as on our owne coasts, and these rootes being dryed were sold in former times by counterfacturers, for Benrubrum to the Apothecaries, as Guidandium and Gesner in borth say, Dodoneus Calleth it Valeriane rubre similie, all other Authors call it Limonium. The second is of our owne Land sound out by Doctor Lobel, in the siedes neere the Sea by Colchester, and as Clussus sinh shapaine. The third is the Limonium pervent Narboners of Lobel. Comerarius, and Lungdamensis. The fourth and sith, are set forth by Bankium onely in his Pinax and Prodremus. The sixth of both sorts were never published before by any. The last is as in before said, remembred by Clussus in his History of Plantes, and I have here simplified it: but it semething meethse Lobels Thurin Limpids solium is this. The Limonium pergrisum Rentwelss, there shewed you in my sormer Booke, yet I thinke good to give you the figure thereof here with the rest. Plusy referret the Limping months Beens and calleth it a wilde Beete, but Galen saith there is no wild fort of the Bette. Gerard called it in Anglis Sea Lavender, but without any other good ground, then that the colour of the showers is somewhat accept those of Lavender. I have therefore as you see altered the title unto a more proper name as I take it, being in some and colour most like unto Buglosse.

The Vertues.

The feede of Limonium as Dissorides and Galen say, is allument, and so is this Limonium, and sayith the fluxe of the belly and the stomacke, the spiriting of blood like wise, and the abundance of womens confer, the leaves are astringent also, and are good for burning by fire a the water wherein the rootes have being doth take away the spots in garments as also in parchament.

CHAP. XVIII.

Anagalia aquatica. Water Pimpernell.

Here are divers forts of this Water Pimpernell to shew you here for of the Land sorts I have careated in the fifth Classis of this Works.

1. Anagalia aquatica five Becabanga. Brookelime.

Brookelime fendeth forth from a creeping roote that shooteth forth fibres at every joynt, sitting-

1. Anagailie aquatica vulgarie five Becalunga.

and divers and fundry greene stalkes, round and sappy with some branches on them, somewhat broad, round, appetreene and thicke leaves set by couples thereon, from the bosome whereof shoote forth long soutestalkes with landry small blew slowers on them, like in forme unto the land Pimpernels, that consist of sive small round

2. Anagalia aquatica five Becabunga major. The greater Brookelime.

This differeth in nothing from the former, but in having larger and rounder leaves, and in the flowers which of a paler blew colour.

There is likewife little other difference in this fore from the former, but in the leafe which is longer pointed.

Indeed about the edges, and in the flowers, which are of a pale whitish blew colour. There is one also of this atmosphere then it; wherein consistent the difference.

for Kiner Lien 11, 4. Anagallis agraetica folijs pategij. Small round leafed Water Pimpernell.

The leaves of this Water Pimpernell are small and round, like almost unto Pennyroyall, two alwayes at a joynt spanthe stalkes, which are four esquare; and beare blew stowers like the land Pimpernell: the white rootes are in the ground like the former.

The total of this Water Pimpernell runneth not, but is a fmall bush of white sibres, from whence spring many smooth pile greene leaves, small at the bottomes, and broad and round at the ends, the stalke is round, about a stone more after high, with divers smaller leaves thereon, set one by one up to the toppe, where breake forth many breaded spikes of white slowers.

Demonstration of the state of t

7. Anagalis aquatica angulfifolia sentellata. Narrow leased Water Pimpernell.

The roote of this Water Pimpernell is reddish, sibrous, and creeping, the stalkes are smooth straked, joynted, and southigh, having two very narrow and long leaves at every joynt, pointed at the ends without any stalke unto them: acvery joynt almost with the leaves come forth small upright branches, winding themselves one within mother, as if they had classers, from whence spring smaller sootestalkes on both sides, which sustain small white showers like unto Chickeweede, consisting of three leaves a peece, after which succeed small state which shield, that is, two set together with a three betweene them, on both sides whereof lie the

5. Anagalis aquatica tertia Lobelij, julio jubrotundo non cremeto. Lobeshis third Water Pempernell. 6. Anagallis aquatica angustifolia sive quarta Lobelij.
Long Chicaveced leated Water Pimpernell.

The Place and Time.

All these grow in small standing waters, the three first, and the fifth often found in our owne Land, the found All these grow in small standing waters, the times that the last in Germany. The fixth by Ammerge. And shower in Issue and Isly most usually, giving leadetheness moneth after-The Names

. It is called in Greeke anayannis fruders, in Latine Anagallis aquatica. The first is commonly called Begaining It is called in Greeke danganase, structure, in Latine company many the description the Germane word Bachpunghen, as is infault with them to frame Latine words from their owne applications to Similar Trick and from the Germane word Baespungeen, as is untart with the state of the tions. Anguillara, Brunfelsius, Ericius Coram, Pucosum, and others, would be bodoness, and Inspersal, the very erroniously, and thereupon Tragus and Gosper, call it Simm non odoratum Turner, Dodoness, and Laganussis the it to be his Copea, but generally now adaies called Angallis aguatica, and to Lobel, Dodoness, and others doe, yet Tabermontanss and Bashinss call it minor, because he callet the next major, and Thalism folio maxime. The third Tabermontanius and Baubings call it minor, became he calleth the next major, and a maine joile maxime. The third is called Bernla major by Tabermontaniu, and by Baubinus Anagalis aquatica major folio oblonge, as he doubthe lefter of this kinde minor. The fourth is called by Tragus Simus alternus, and Anagalis aquatica, and by Baubinus Anagalis aquatica foliy: pulegy. The fifth and fixth is called ay Lobel Anagalis tertia & quarta, Guilandius did divently thinke of the fifth, taking it one while to be Alisma of Diofeorides, and another while to be Cachleria, but neither truely. Some alfo tooks it to be Samolas of Pliny, lib. 25. c. 1 1. and Baskins calleth it Ausgalis equation foliorotundo non crenato, but some of the others before have rounder leaves. The last is called by him as it is in the foliorotunao non crenaro, due tome or the others desirely avertounded, search as a Carala, yet Amerika faith that Berula is the Greekes 241 apor, Cresses. The Germanes as is said Bachpunghen, and Wasserpungen, or bungen as Traout hath it. The Dutch Water punghen and Beck punghen. And we in English Brookslime usually for the first and Water Pimpernell for the reft following. The Verines.

Tragm faith that Brookelime and Water Pimpernall, are both of a moilt faculty, yet others fay dry, being no lesse heating then Water Cresses, and are used both in meate and medicine, as Water Cresses are, yet weaker. Brookelime and Water Creffes are generally used together, much in diet Beeres and Ales, with other things freving to purge and elense the blood and body from those peccant humours, that would overthrow the health thereof, and the Scurvy alio, for which they are very helpefull: they alio helpe to breake the store, and passe it amy by urine, which it provoketh alio being stopped, it helpeth sikewise to procure womens courses, and to expellibe dead birth, being fryed with butter and vinegar, and applyed warme, it helpeth all manner of tumours, and fwellings and Saint Anthonyes fire alto, if it be often renewed. Farryers doe much use it about their horses, to take a way swellings, to heale the scab, and other the like discases in them.

CHAP. XIX.

Nasturtium aquaticum. Water Cress.

Doe diftinguish betweene Simm and Naft artium aquaticum, as Bankinsu and Gefrer in borth doe, holding them to be differing kindes of plants and not species ejustem generu, and therefore entreste of them in leverall places, as I also mult doe in severall Chapters, and speake of those forts, that for their likenesseunto Cardamon, Cresses may be called rapda por truder, Cardamon enudron Nofturium aquaticum: for of the Cardamines, which are Field Cresses, I have encreated in the seventh Classis of this Worke, one of whose figures I give you here to shew their difference.

I. Nafturtium aquaticum vulgare. Common Water Creffes. Our ordinary Water Creffes spreadeth forth with many weake hollow sappy stalkes, shooting cut fibres at the joynes and upward long winged leaves, made of fundry broad sappy and almost round leaves, of a brownish g: cene colour, the flowers are many and white, standing on long footestalkes, after which come (mall yellow sed contained in small long pods like horses, the whole plant abideth greene in the Winter, and tasteth somewhather and sharpe like Cresses.

2. Nafturtism aquaticum Italicum. Italian water Crestes. This differeth little from the former, but in that the Balke is crested, the leaves are cut in a little here and there on the edges, and dented, formewhat refembling Parfley leaves, and in the tafte of both herbe and feede, more mild and pleasant, the roote likewise creepeth not as the others.

3. Nationium aquatieum amarum. Bitter Water Cresses.

This fort groweth greater then the first, with longer and more pointed leaves, when it runner hup to stake, but the first leaves are very large and round, little differing else from the forme, but is so exceed bitter in take. that none can away with it to eate it, unleffe it be boyled in water, and shifted againe impother fresh boyling water, to take away the bitternesse, and so some doceate it: this is often sound growing in Germanie as Thaline faith, with the former, and knowne afunder by the greatnesse.

4. Nafter imm aquaticum minus. Sweete smelling Water Cresses.

This small Water Cresse hath a small long white roote, with some sibres thereat, from whence spring sundry winged leaves made of many much smaller then the former, and somewhat long with the smallest smalling. reasonable well : the stalkes have divers white flowers upon them like unto the Cardanine, but smaller by much: the seedes are like in such slender pods and of the same talte.

The Place and Time. All thefegrow in the small standing waters for the most part, yet sometimes in small rivulets of running water: they flower and seede in the beginning of Summer.

The Names. The first is generally taken to be the Sifymbrium alterum of Diescorides, which as be faith. sew called Sium, and others Cardamine, being fo like in tafte thereunto, Matthiolm, Gafalpinm, and Taber mentan call it, Siffir briam 1. Naftmelum aquaticum unique. Common Water Creffes.

3. Naffurtium aquaticum ama Bitter water Creffes

2. Raftursium que secum trolicum. Italian water Crelles.

Cardamine. Ladies Smockes.

Creffes.

aquaticum, Cordus, Gefner and Thalim Sifymbrium alterum, Fuchfisu and Lugduner fit Sifymbrium Caldamine: Dedonam called it Simm and Laver, Ericim Cordus Creffo Laver eduratam, and Lebel Sien Crateve Ernefoliam, Anguillara tooke it to be Vella Galeni, and Tragus, Lonicerus, Dedonem and Bankin w call it Noften tiam agastican. Anguillara tooke it to be Vena Gaican, and argan, and tragians as he faith, call Creficene. Lebel and Lugdans for call it Sium Matthioli & Italorum, and Banhinm Naffartium aquaticum erellum folio lengiere. The third Italian remembreth in his Harcynia fylva, by the name of Sifymbry alterius speties fecunda, and Banbinus Nafiarijan remembreth in his Harcynia sylva, by the name of sigmony atterns sylvanian aquaticum maju & amarum. The lest is called by Camerarim in his Epitome of Matthiolus, Sissimbrian aquaticum alternm vel minus, and by Lugdanensis Cardamine quarta Dalechamps. The Italiana as is beforefaid callic Crescione, the French Cresson deane, the Germanes Brunkressen, the Dutch Water kresse, and we in English Water

The Vertues.

The Water Cressere hotter in taste then Brookelime, and more powerfull against the Scurvy, and to chase the blood and humours, and for all the other uses whereunto Brookelime is before said to be availeable, as to break the Rone to provoke urine and womens couries: the decoction thereof is faid to be good to wash scale and file thy Vicers, thereby to cleafe them and make them the fitter to heale: The leaves or the juice is good tobe anplyed to the face or other parts troubled with freekles, pimples, foots or the like at night, and taken away or wath ed away in the morning, the juice mixed with vinegar, and the forepart of the head bathed therewith is very good for those that are dull and drowne, or have the Lethargy.

CHAP. XX.

Sinm feve Pastinaca aquatica. Water Parinep.

Types Writers have made divers forts of herbes to fuite with the Sium of Dioscorides, Some whereof I have the wed you in the Chapter before, the other that are held by the most judicious to be the trust and necreft thereunto thall follow in this.

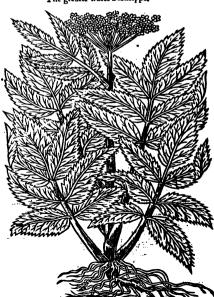

1. Simm Dioscovidie five Pastinaca aquatica major. The greater Water Parsnep.

This greater fort rifeth up with great hollow and crefted stalkes, two or three cubits high, parted into divers branches, whereon frand long wings of leaves made of many long and somewhat broad leaves pointed at the endes and dented about the edges, smooth thicke and sappy, every one whereof is as large as of a Parsnep, the flowers are white and fland in tules or umbels, after which follow the feede which smelleth well, and is bigger and rounder then Anneleede, the roote is blacke with many fibres at the joints thereof, and of the stalkeunder the Water neere the ground, the whole herbe is somewhat of a strong sweete sent. 2. Sium minm five Paftinaca aquatica minor. The leffer Water Parfnep.

The leffer fort is very like the former, but lower and leffer, the leaves being long and narrow, and dented also

2. Sium Diofcoridis five Pallinaca aquatica major. The greater water Parineppe.

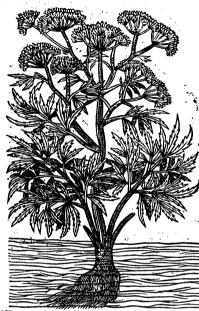

TRIBE 14 1. Siam mirus elttrum

3. Sium majus alterum angustifolium. Anocher water Parineppe with narrow leaves.

Sium minimum Noli me tangere diflum five. Impatiens Naftwij (gloeftris folio. The Quicke or Impatient Creffe;

barthe edges, the flowers are white and the feede fenall like beformer, the roote likewise is very fibrous, and both it and televes fmelling ftrong like Petrolemus. There is another of mi fort leffer then it, whofe white flowers frand in rounder mis then the others.

3. Sinne majue alternue angultifelium. Another Water Parinep with narrow leaves. Tellalkes of this Water Parinep are hollow like Hemlocke. abitor more high, whereon are fet fundry winged leaves Mette former, but divided into smaller leaves, and closer fet agency, each of them being denied about the edges, the flow-th the toppes of the branches, are of a pale yellowish greene when, which turne into small seede like unto Parsley, but tainglike Cummin or Candy Dankeleede, and the Citron rinde writher somewhat hotter then they all, the roote consisteth of number of flender writhed browne fibres, wrapped among temfelves and fastened strongly in the mudde.

4. Sistem minimum Notiones angere diffum five Impasiens
Nationally strongers folso.

The Quicke of Impatient Creffe. This hall plant ipreadeth at the first upon the ground many initial plant spreadth at the first upon the ground many fall winged leaves not much above an inch long, which so a like from a similar that it spring that the spring growing somewhat bigger, hast the leaves a little extend about the edges, the end leafes too the most part being the spring growing up with a slender stake, but fundry bases from the middle thereof to the goppe, at whose ends you many very small white slowers with slender long pointing the many very small white slowers with slender long pointing them. to de after them, and finall yellowish seede within them, wenthey are ripe, but so hard to be gathered, and impatient wher touched, that the pod breaketh it selfe upon the least touch of hand or any thing elfe, and the feed flyeth out present, which little or no taste of heare in it. Mr. George Bowles. A

endeman of excellent knowledge in Herbarisme, gave me defectes of another fort hereof, as he faith, which he had from another skillfull Gentleman a friend of his, but comie I have not yet seeme the face thereof, I can passe no further verdict thereon.

The

The Place and Time.

The first as it is thought groweth not with us unlesse the greatnesse make the difference, but in Germany. For the fecond which is very like it groweth in Kent in divers pooles, and watery ditches. The third neere Aumerican Lobel faith but hath beene found in our Land allo. The last likewise in our cand. They all doe flower in the end of Summer, and feede before the end of Angust. The Names.

It is called on in Greeke, so called sa To ober, a concutiendo quia quatitar vacillando g, perpetuo sucutium meter labentibus undis at g, semper alluentibus unde etiam laveris nomen latinis, mili quis malit ab vrinis calculig, ciente exentions unau arg, semper numentapes una called Simm in Latine, and Lavers The first is called by Tabermonianus, Gorad, and exentiendis dictum: 18 110 called Sum in Latengania Baubinus. Sium verum Disservisis of Matthiolus Thalise and Lug. Baubinius, Sum majur and Largoinim: the recolul site Simb Majur angulfifelium. It is the Simm edization of the sim of the millaken. Anguillara Called it Silanm Pliny, Cordus and Dodoness, Simm & Laver, and to doth Lobel, and addern Olufary folio five aquatica Paftinaca, The finaller of this fort Camerabid Hafleth Simm verum in his Epitome. The third is called by Lobel Sium alternum Olfa tri facie: but Lundunensis and Baubitins. Sium entering felie, Tabermenta-nus calleth this Sium majus angustifolium, and not the former as Malter Tellifum doch. The last was first remembed by Prosper Alpanus, in his Booke de plants exortes, by the name of Siam majus, but with usus it is in the title. The Arabians call it Rocashalms and Inhamshanella, or Hamchanella, The Inhams as Cafapinus flith, call the Sinn Creftione, and Matthiblus faith, they call it Sie, and Gorgoleste. The Standard Reduction, as forthe faith and Berry or Agricus as others fay. Tragus faith the Grimanes call it Branen peters, And we be needer to the filtenesses. thinke, Water Parineppe. The Vertues.

Tragus and others, from their Countries erronious appellations of the main, reduce it to be the English Diof. coridis, or Apism palastre, and therefore attribute all the properties thereof into this plant, norther bave then or any other of our Moderine Writer's left in record, any other particular known equality in it, more then Dissender and Galen have left us of it, which say it is of so much more heating facility, as it is tweeter in talle, it allo digethen and provoketh urine and womens courfes; and breaketh and expelleth both the stone in the kidneies, and the dead

CHAP. XXI.

Ernea aquatica. Water Rocket.

His little herbe which is fomewhat like the former Impatient Cresse, lyeth or rather creepeth on the ground, with long branches of small winged leaves, somewhat like thereto, but not so much dented on the ed-

ges, having but two or three deats for the most part, and vellowish flowers at their toppes, and slender pods following them.

The Place and Time.

It groweth oftentimes neere ditches and water courfes, and often also further from them.

The Names.

Ir hath no other name then is in the title, for any thing I know, not finding it mentioned by any other Authour.

The Verines.

Wee have not heard or found for what griefe this is conducible.

CHAP. XXII.

Mentha aquatica, Water Mintes.

Aving shewed you all the forts of sweete Mintes, that grow in the dryer or Vpland grounds, there remaine yet two other forts, that grow in Marshes, and wet places, which shall bee shew-

Mentha aquatica rabra. The Red Water Mint. This Water Mint rifethup from a creeping roots, running or spreading in the Muddy or water ry places, with many brownish square stalkes, branched almost from every joynt, with a couple

oftomewhat broad, yet bolimpid and deticed leaves, many times brownish or reddifficand deticed leaves, many times brownish or reddifficand at the ropped of the small famen that are purplish, sland at the ropped of the stalkes indicates, in loose round sufer side above another.

2. Menth's squartes flow bellefit is minor.

The lesser Water, Mint.

Thi other Water Mint shooteth forth a square reddiff This other Water white in located represent square results built bling blike, and fomerime a little boary, shout a foote high, when home are fet for hairy refund and fomewhat long leantwo alwaies at a joyne denied about the edges, of a driegrene colour on the upperfide, and gray if hor hoary interseath: from the joynes with the leaves come forth lose branched falkes with purplifth flowers at the toppes of them flanding in round heads: the whole herbe is of a frong fent. The Place and Time.

They both grow by ditches and water fides, in the planity grounds, where they joy belt, and flower late in the

The Names.

The Greeke name Einip Beior, which Diofcorides menticrethand many doe call this by, doth more properly be-lone to the wild Minte Mentaftrum, then unto this how erer Libel and others call it Sifymbrie Mentha, for Dioferides hath but one Silymbrium, that is fweete and like Minter, and that he faith groweth in waste grounds, the other Sisymbrium called Simm, and Cardamine, and like Mefertium, as he faith groweth in watery places as I have hewed before, fo that as I faid his Silymbria Mentha, is so watery or Marth planer it hath beene and yet is beyond Su called by some Apothecaries, Balfamina, as Tragm saith adby others Balfamina as Bester in horco Ensteans saith, Our first fort here set downe, is that which Lobel calleth Aquatica Sifymbria Montha and Gefner in hortie Sifymbriwayreste aquaticum, and Calamentha aquatica, Matthiom and Lugdanensis Sisymbrium sylvestre, and Sisymbrium by many others. The other Baubians onely remembreth by the name of Mentha resundifolia palufris miner.

1. Mentha aquatica rubta. Red Water Mintes.

The Vertues. There is little fet downe concerning these Water Mints, of any other speciall properties, they hold from the other Mints being feldome used, because there are so many of the other forts of Mints to be had almost at hand evewhere, yet their firong (weete fents and quicke taftes, doe argue them to be eff-chuall for many of the purpois whereunto the other Mists doe ferve, especially to kill the wormes, to warme and strengthen the stomacke, to expell winde and helpe those that are spleneticke.

CHAP. XXIII.

Dratuncubu aquaticm. Water Dragons.

Elides that Water Dragous that many Authours have written of, Banhinso hath given us the knowledge of mother from Braffl, which for the likeneffe be referreth unto the greater Dragons, but I

have thought good to make mention of it in this place.

1. Dracmersha mofter aquaticm.

This hath a creeping roote full of joynts and fibres at every one shooting forth fundry long sheathes or skins and with them smooth long hollow stalkes five or sixe-inches high, with broad round leaves set on them provided the adult of the ad pointed at the ends, bigger then Toy leaves by much, and of a famining greene colour, from among them also rile. diverse other smooth hollow stalkes of the same height with the leaves or not much higher, bearing at the toppeof every one, a small long head encompassed with many shore white threds. which are as the flowers, and with the head such a like leafe as the rest are but lesse and white on the inside, enclosing the head before it breake open.

TRIBEIL. which when it goweth toward ripenesse, becommeth cluster fashion like the seede head of Arms Wake Robin, which when it goweth toward ripenetie, occurring divers huskes, with small and long brownish seede therein: the talte of the leaves and stalkes, are very sharpe, hot, and burning the throate: like Arum or Wake Robin, but

is not to felt at the first chawing.

2. Draenneulus feve Serpensaria Brafiliana triphylla. The three leafed Dragons of Brafill.

The stalk only of this Dragons with the leafe and flower on it, as Banhinns faith was brought unto him, and therefore we can describe unto you no more, then that from a stalke that is reddish and crested, riseth the stalke of the leafe which is of an handbredth long, and smooth, at the top wherof growth a thin leafe of a whitish green colour, full of veines, and somewhat round, divided into three parts, ending in a sharpe point, the lower parts having each of them an hollownesse at the bottome of them, of two inches and a halfe wide apeece, and above foure inches long the flower that itood on a three inch stalke was also like unto the greater Dragous, being five inches long, and an inch and a halfe broad, of a darke reddish colour, and striped with many white veines running through the middle, especially on the outside, having also a blackish long pestle in the middle, and twyforked at the end. The Flace and Time.

The first groweth in ponds, and lakes of standing waters, but never out of it, and not in any place that I can here of in our Land, flowing in luly, the berries being ripe in the beginning of September.

The Names.

It is called by almost all Writers of herbes, Dracunculus palustria, or aquaticus, yet Lobel Anguina aquatica, and Fuchstus Hydropiperi rubeum, Gesner in hortu Aran palustre, and is Pliny his third Dracontium, with a joynted Reede like roote, having as many leaves growing thereon as it is yeares old, and thereon Banhimu calleth it Dracunculus palustris sive arundinacea radice. The other is named of Baubinus Serpentaria triphylla Brasiliana The Germanes call it Wasfer schlangenkraut, and the Dutch Water flangen cruyt, and We Water Dragons. The Vertues.

1. Dracunculm noffer aquiticm. Our Water Dragons,

It is thought to have the same property that Arum hath, but yet leffe effectuall to any purpose.

CHAP. XXIV.

Plantago aquatica, Water Plantaine,

Here are three or foure forts of Water Plantaine to be declared, some greater and others lesser, 1. Plantago aquatica major. The greater Water Plantaine.

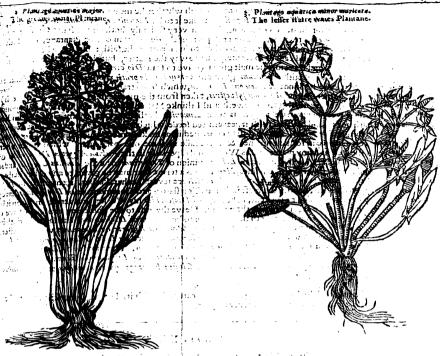

The greater Water Plantaine shooteth forth sundry long thicke greene hollow stalkes, with large long greene leaves on them with some shew of ribbes in them, like unto Phantane, but are much greater than the stalkes and the stalkes are much greater than the stalkes are much greater than the stalkes are much greater than the stalkes are stalked as the stalked ter, fiffer, and longer, and with sharper ends from among which rife up divers tall three square spon-

gy flalkes, parted into divers branches at the toppes, whereon fland a number of white flowers, compoled of three leaves apeece, after which follow three square small greene heads, containing the feede : the roote consider hof a great bush of many long fibres set together.

2. Plantago minor aquatica. The leffer Water Plantane. The lesser Water Plantane hath sundry long leaves rising from the roote, fixe times smaller and narrower then the former, from among which rife divers bare stalkes a foote high, bearing a tust of many blush coloured flowers, made of three leaves a peece like the former, each standing on a long footestalke, and all rising from one head like an umbell, after which follow rough heads like unto those of the Crowfoote: the roote consisteth of many small white fibres.

3. Plantago aquatica minor muricata. The leffer ftarre Water Plantane. The starre Water Plantane, hath divers small and long leaves, like those of the Ribbewort Plantane, burmuch fmaller, and turning themselves backewards: the slender naked stalkes which are halfe a foote high or more, beare at their toppes sparsed small tusts of white three leased flowers, and after them prickly heads, standing our with ends like unto a starre, wherein lye the feede : the roote is a bush of long white fibres.

This least Plantane spreader is the wholly upon the ground, bringing forth sundry small long and narrow leaves, standing on very slender footestakes, among which come many slender stalkes lying downs on the ground, being not much above an inch long, and ending in a small head, which sending forth small shreet complete and and

2, Plantago aquiatica minor. The leffer water Plantane

whileth roote in the ground agains, shooting forth other smaller leaves, among which spring five or fixe full round buttones, (for no flowers were observed) fanding on very fine stalkes, opening into two parts, shewby very small seede within them: from among those round buttons grow also other rowes or courses of small badebunging forth other smaller leaves and buttons then the former, the rootes are nothing else but very fine thecds or fibres

The Place and Time. There doe all grow in watery ditches, plashes and ponds of water. The first almost every where through the Ind. The second also in divers the like places with us, for Labelfaith, Doctor Penny the wed it unto him. The find I have gethered in the disches, on the left hand of the Highway from Hallower to Hophquie. The last hath occitione place named where it grew.

The Names, Molt of our later Herbaristes doe call it Plantago aquatica, Fiftula pastoris & Barba Silvana, although Tragus and Label, and divers others found it little to agree to, or refemble any Plantane, Cords on Dioscorides affuredly

1. Segitteris mejor latifolie.
The greater broad Arrow heads

2. Segitterte wher latifolia.
The leffer broad Arrow head.

The Vertnes. These are held to be of the property of Water Plantane, that is cold and dry but Lugdanens's faith they are cold

Tribulus aquatieus. Water Caltroppe.

Here is a greater and two leffer forts of this Caltroppe to shew unto you, which are these.

This great Water Caltroppe bath sundry broad, and more then halfe round leaves, in some places spotted on the under side, and dented about the edges, set on long sootstakes which rise in the Water from the head of the roots, every one by it selfs, being smaller at the lower end then they are next blaws, among which rise up sappy round stalkes, no higher then the leaves, bearing whitein flowers at the laws, and the stalkes are next selfs. The stalkes which they are next the stalkes are next selfs as the stalkes are next selfs. mperand after them, thicke, hard and wooddy, almost round heads, with three or foure that pe points sicking. on of the bigneffe of Fiafell nuts in fome places and blackiff in others, as bigge as a great Wallnut, having a (weet whick kinell within it like unto a Chefnut: the roote groweth fomewhat long and full of joynes with a tuft of bure or fibres at each of them,

2. Tribulus aquations miner prier. The former finall Water Caltroppe.

The former of the two leffer force, from a long creeping joynfed roote fending forthrufte of fibres at the joints, Mile at the lower joynts of the ftalkes shoote forth very long flat stender and knotted stalkes, two or three cubag according to the depth of the water wherein it groweth, (which being dryed are pliant and flexible, be long, secording to the depth of the water wherein it groweth. (which being dryed are pliant and flexible, fifty many workes) divided towards the toppe, into many branches, carrying fingle leaves at the lower joynts, who fiftee, being about two inches long and halfe an inch broad, thinne and almost transparent, so waved on the structure they feemed be torne, of a reddish greene colour for the most part 1 but those on the branches ppwards between they greene to be torne, of a reddish greene colour for the most part 1 but those on the branches ppwards between they couples: from the joynts with the leaves come forth small societalkes, bearing at their ends shall which long and thicke flowers, set together in manner of a ciniter of Grapes (others have soond it with redshifts howers) to every of which when they are false, increded for the most part source sharp pointed graines in the source of the same structure o

meant this by his Potamogeton, although Baubinus doubteth whether he meant not Dioscorides Alisman Danas.
nion which is more likely to be Helleborine. Anguillara tooke it to be Limminus, as Baubinus quoteth it, and Ma. nion which is more likely to be Helleborine. Anguillara tooke it to be Limonium, as Banhima quoteth it, and Mafter Johnson in his Gerard from him, commenting thereon very feriously both on the foure Greeke names given to Limonium and no other, being so answerable thereto in all parts as he saith: but they a little, mee thinks he triumpheth afore the victory and cannot to cleanely carry away the matter, butchast there somethes his text, and the ferore he mile give us leave to find the finds that there in the way to stumble at: and therefore he mile give us leave to find the finds of the blockes in the way to stumble at and therefore he mile give us leave to find the finds of the blockes in the way to stumble at and therefore he ment give us leave to find the finds of the blockes in the way to stumble at an and therefore the more thoroughly: for first hee saith Limonium groweth is say and in pratin finds of the stumble and by Clustum its judgement is the Anemone Islands which Gaza trapslates in groweth but he doth not say in aquosis, where usually this groweth, and I thinke Maste filed he with the button of the product of discharge in the said of the characteristic stumble which the product is groweth but he said his said the reversible in the said has said the s nion which is more likely to be Helleborine. Anguiuma tooke it to be Lamonaum, as discount, and Ma-fter Iobnion in his Gerard from him, commencing thereon very ferrounty both on the foure Greeke names given taginella palustris.

It is found to be cold and dry by the altringent talte it carryeth with it, but yet is not knowne to be used in Phylicke to any purpole, either of greater or leffer respect.

CHAP. XXV.

Sagitta five Sagittaria. The Arrow headed water plant.

F this Sagittaria there are three forts observed by most writers as shall be shewed.

2. Sagittaria major latifelia. The greater Arrow headed water plant.
This greater fort lendeth forth fundry thicke square and sappy stalkes from a thicke bushy roote of many strings, with great broad greene leaves on the toppes of them, divided at the bottomes, into two long and pointed parts, so that the whole forme of the leafe resembleth very well the forked head of the broad Arrow as wee call it', which parts ftand but little above the waters wherein they grow, be they deeper or shallower : from among which rife up other thicke round spongy salkes, higher then the leaves bearing divers rowes of flowers at the joynts, one above another, and three in a row for the most part, each whereof is composed of three large white leaves with fundry reddish threds in the middle, after which comein their places round rough burres, that are greene when they are ripe, and like those of Sparganium, the Burre

2. Sagittariaminor latifolia. The leffer broad arrow head.

This leffer fort hath onely leffer leaves, and flowers, yet broad and of the same forme with the precedent, the burres and rootes growing as great or greater then they.

3. Sagittaria minor angustifolia. Narrow leased broade arrow head.

This likewise differeth not from the two former, in the manner of growing, but in the narrownesse and length of the leaves which are not of halfe the breadth with the former, yet hold their length, the two lower forked ends being almost as long as the foreright leafe, the flowers also are lelle, as are the burres and rootes.

The Place and Time. All these forts may be seene sometimes together, in the same ditches and waters where they grow, or elle separate in fundry places of this Kingdome, and doe flower about Midsommer, their burres being ripe in the beginning or middle of August.

The Names: . It is called in Greeke mesica, and as Pliny faith, lib. 21.c. 17. Magopiffams or Pistana Magonis, in Latine Sogitta, Sagittaria, and Sagittalia. Lobel hath a quere on the first, if it bee not Stebe femina, but called Phlor ma laifelds by Lugdunenfir, as he doth the other Phlos five Stabe Theophrafti angustifelia: but as I have showed in sundry places before in this Worke, that Phlors and Phlors in Theophraftis be differing plants. Phlors being a watery plant growing in the Lake Orchomensu, and Phlors I have set downed in the Chapter of Posteriom, and proved it thinks (lifetimely see he see a See See Lake and Chicago. ved it I thinke sufficiently to be the Stabe of Theophraftm and Dieserides. Cesalpine calleth the greater fort Barba sylvana, and Dodoness faith that some did call it Lingua serpentis, and thereupon the Dusch called it Serpentis toughen, and the Italians Gaette, But wee in English Water Archer, Arrow head or broad Arrow head as I call it.

3. Tribulus aquaticus major. The greater Water Caltroppe.

chatelli Cordi: the fruite or head that succedeth, groweth to be fixe square: the roote is not much unlike the former.

The Place and Time.

I cannot heare as yet that the first is found in any country of this Land, as the two others are : but in fundry Lakes in Germany, as also in Brabant, and in many places in Italy and neere the Sea also, as Matthioles faith, but flower there and give their fruite in Summer.

The Names. It is called in Greeke Tpilon@ evulp@, and Tribalus aquations in Latine, Anguillara taketh the first to be Butomos Damocratio, all other Authours call it Tribulus aquation or Lacultris as Cordus doth, and the Apothecaries of Venice and other parts beyond Sea Tribulus marinus, and the nuts Castanea aquatiles. The other two forts are called by Clufin Tribulus aquaticus minor and distinguished by him, and by Baubinus referred to the Potamogeton, calling them Potamageton folis crispie five Latinea canatwo forts, as by comparing his words may be feene. Lobel calleth it Fontilapathum pufitum, and Tragus maketh it his fecond Alga. Mafter Finch, a London Merchant travelling in the Mogols Country, in the East Indies, faw the greater fort growing like a weede, abounding in molt tankes or ponds there, whose fruite hee tooke to be the tankes or ponds there, whole the the the Hermodaliile but was much therein deceived: the kernell of the nut as he faith is much exce by the Natives and others, called Singarra by them, himselfe finding them very cold in his stomacke that he alwayes after the cating of them defired some Aqua vitz to warme it againe, You shall find this relation and that of the Fabe Espriage (48. it is extant before in this worke folio 376.) in the tourth Booke of Mafter Purchas his Pilgrims, the fourth Chapter and fifth Section, folio 429. The worthy relations of whose cravailes there extant doth not onely in this but

Tribulus aquaticus minor alter.

The Theater of Plants.

in many other excellent matters declare his industry, whereby many have reaped much profit thereby, I would in many other extends and the first state of the fi

The leaves are cooling and represse inflammations being made into a pultis and applyed: the juice mixed with pricates and source and fores of the mouth and throate, and the rankenedie of the gummes being gargled, the being the source and the rankenedie of the gummes being gargled, hony nearest that the Thracians that inhabit about the river Stramon, do fatten their horses with the leaves and make brad of the nut kernels to feede themselves which doth binde the belly.

CHAP. XXVII.

1. Stratiotes five Militaris Aizoides. Water Souldier.

He Water Souldier hath divers and fundry long narrow leaves tharpe pointed fet close together fomewhat like unto the leaves of Aloes for the forme, but much leffe and sharpely toothed about the edges like it alfo, from among which rife up thort stalkes not much higher then the leaves, and fonetimes lower bearing one greene threeforked head onely at the toppe much like unto a Lobsters claw, which is the huske, out of which commeth a white flower, confilling of three leaves with divers yellowish hairy threds in the middle : under these leaves there is a small short

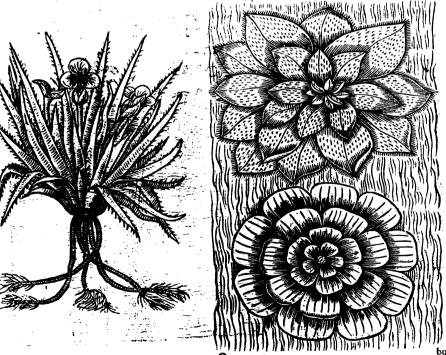

hadingedelt next unto the leaves and smallest downewards, from whence doe proceede sundry long strings. the final wormes (wherewith as Dodoness faith, some crafty men and women leeches putting them into glasses withwater to make them them the greater, make others believe that they are wormes which came out of their boiles, so whom they have given medicines for that purpose) which take roote in the mudde under the Wa-

> 2. Stratiotes Aquatica pera Dioscoridis, & Egyptiaca. The true Water Houseleeke of Egypt.

This Water Houseleeke hath divers large and broad thicke, hard and hairy whitish greene leaves lying on the water in three or fourerowes, round compaffed together, like unto those of the great tree Houselecke, but greater, the attended row of them being broadest, and the inner smaller and smaller, Alpinus sheweth them to be pointed.

> 1. Straiotes five Militaris Airoides. The water Souldier,

i. Stratiotes aquatica vera Diofeoridis & Egyptiaca. The true water Houfeleeke of Egypt.

but Vestingins round and plaited, and the ends a little foulded backwards as Vestingins hath it, which I give you here but Vestingins round and platted, and the choice a latter during to the state of th together, this hath not beene opierved by entire or careful want the leaves which lye on the water like Ducks faith, is a family thin peece of wooll that hangeth downe from mader the leaves which lye on the water like Ducks faith, is a small thin peece of wood that languest the passing downe to the ground, although Dioscorides faid it had no rootes, the leaves are of a drying stipticke or astringent talle no lesse then Acadia. The Place and Time.

The first groweth in Germany, and the Low Countries also plentifully, and in Italy and other Countries also, the other hath beene observed in Egypt by Alpinia and Vestingini, and no where there but in the watery ditches, necessary Damiata or Pelusium.

The Names. Diescorides hie Eregnisses, whereunto is added writin Gor irude that it may be knowne from 'els geniseund is called by Matthiolus Stratiotes aquaticus in Latine, and so also by Lugdanensis, and is my second fort, here express in my judgement rather then the first because the leaves and the posture also doe more resemble Houselecke then the former, which is like unto Aloes, although it be called also Sedum marinum, and againe, because it hath not beene observed any where but in Egypt as I faid by Alpinna and Vestingian, however Lobel calleth the former Street tiones five Militaria Airoides, and Dodoneus Stratiotes potamios of fedum aquatile. Banhinus placeth the former with the forts of Aloes, and calleth it Aloes palastris, and the other he placeth among the Louisine, and calleth it Lenticula palustris Appriaca five Stratiotes aquatica foligs Sedo majore lastoribm. Alpinm faith that the Egytians call it with them Hayhalemel maoni, that is as much to fay as Sedam aquasicum. It is probable that Throping. from meant this plant, whereunto he giveth no name, fpeaking thereof in the end of the ninth Chapter of plantourth Booke, growing in ponds like a Lilly with many leaves of a greene colour, &c. The Vertues.

Each of these are very cooling and drying, and astringent withall, but Galen faith it is cold and most, and as he and Dioscorides say stayeth the stuxe of blood that passeth from the kidneys, if it be taken in drinke, Play addeth thereunto fome Olibanum, it flaveth likewife the fwellings of wounds and canfeth that they be not enflamed; it helpeth other inflammations called Saint Anthonies fire and fwellings in other parts, it healeth also all wounds and vicers, and is good for fiftulacs or hollow vicers, Alpinus faith that the Egyptian women use the juice decodion or pourther of the herbe, a dramme every morning to thay their courses, or other iffues of blood in any other part of the body: as also the Country people use it to heale any wound, in bruising the leaves and laying then thereon, which wonderfully healerh them.

CMAP. XXVIII.

Gladiolus lacustris Clusij sive Leucoium palustre store subcaruleo Bauhini. Water Gladioll.

1250

by him in a great pond or Lake of water where no other herbe did grow, belides in the Country of Drentia,

néere unto a small village called Noreke and Westervelde, is set downe by him with this description. The leaves doe feldome exceede the length of nine inches, being thicke and hollow fewered with a partition like the cods of Stocke-Gilloflowers, or the like, but greene and iweete in taffe, being an acceptable food for the Duckes that dive to the bottome of the water to feede on it, which is diverselles depth under the water : yet the stalke that springeth from among those leave, is seene to rise above the weter. furnished with white flowers, larger. then those of Stockgilloflowers, the hollow and lowest part, which is next to the stalke, being of a blewish, colour, fomewhat refembling theyforme of a Gladiolus, or Corne flagge, but yet not much like it confifting of five leaves, the two uppermost whereof doe turne backeward to the stalke, the other three which are the larger hang downe : unto these flowers succeede round heads or feede veffels broad below and pointed at the end full of red feede. This was observed in flower in the end of July,

The Place, Time and Namet: Are related in the foregoing title and description, as much as can be said of it.

for although Cluffer would not alter the name thereof, whereby it was fent, that others might know with what for although the Yet Banking thinking it better to agree in leafe and flower unto the Leucoism, rather chose mentante to any palufire flore fubcerules, but I dare not herein follow him, for it hath as little correspondence will it Lenconin purifice fore fineternise, but a dare not neven follow him, for it hath as little correspondence with the Stocke Gilloflower, as with the Gladeston or Corne Flagge, neither leafe nor flower being like a Stocke gilloflower, but in that the leaves are made like the double huske or feede vessell of Loucoism, which maketh little cholonous, one in the state of the flowers doe more answer to the forme of the flower of Gladiolus, and therefore I femille it. And for the Vertues there is none knowne or made to appeare, that the neighbouring people make any nedit in medicine, or any other wayes more then is before faid, for the Duckes to feede on.

CHAP. XXIX.

Nymphes. The Water Lilly.

Here are divers forts of Water Lillyes both great and fmall, both white and yellow, as shall be shewed.

Here are divers torts or water sittyes both great and imail, both white and yellow, as shall be shewed.

This Water Lilly hath very large, very round and thicke darke greene leaves lying upon the water (like unto those of Faba & Egyptia as Dioscorides saith, and that very truely as I have shewed before in the Chapter of Aram) sustained by long and thicke footestalkes that rise from a great thicke round and long inherence of the shall be shall be and with many knobs thereon like eyes and whitish within, from the chapter of the shall be sh and two white other the like thicke and great stalkes, susteining one large white flower thereon greene mile outlide but exceeding white on the infide, as pure frow confifting of divers rowes of long and somewhat mide industrow leaves, smaller and thinner, the more inward they be, encompassing a head within, with many relow threds or thrummes in the middle, where after they are past stand round Poppy like heads full of broad oily and bitter feede.

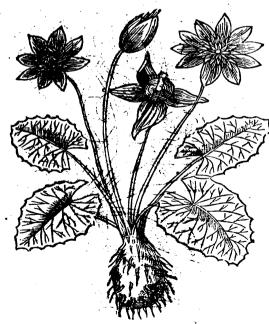

ily another record.

2. Nymphae alba major Ægyptiaea five Lotus Ægyptia. The great white Water Lilly of Egypt.

This other great white Water Lilly, that is entituled of Egypt, fendeth up out of the Water divers faire broad insome given the water, but former, but formewhat leffer, and more waved about the edges, and with more veines in them lying on the fuperficies of the water, as they doe upon feverall footestalkes also: the flowers also are faire large, and double, that is of many rowes of leaves in the like manner, inclosed in a haske, comfilling of four leaves, great on the outfide, and white within, the middle leaves of the flowers are often upon the first opening somewhitefulled inwards at the ends, but growing elder grow straight forth, all of them being white in the middle nurand yellowish towards the brims of a sweete sent like a Violet, in the midst of whom when they beginne to

6. Nouples to exmist The lefter yeilow water Lill .

they rifeth up a finall head, which growing greater becomments the feede velfellanor much unlike unto the other abigs as a good Medlan parted on the infide into evis long wife containing round feede like unto those of Colerabigs are good Medlan parted on the infide into evis long wife containing round feede like unto those of Colerabigs are foreign and the containing and almost post fastions; of the bignesse of an house of the containing and the greftible.

3. Nymphia albu minor: 1 The leffer white Water Lilly. This lefter water Lifty different not from the former; but is the final back of roote and leafe, and in the fugles of the flower which conflicts but of former; but is the final back of roote and leafe, and in the fugles of the flower which conflicts but of five light pin pointed flower per and laid abroad, with flow threads in the middle, and finall fleads with finall fleeds in them.

2. Ny implemable which thinks be under the work of the constant.

Small with the water lift for the proper bit.

The roote of Frogge bit is long sufferee bing, let 'fall of forms, lending detwee from thence long fibres, and where printing division is the lift final water LRIP, but sinch finalter, from which vife the last final water LRIP, but sinch finalter, from which vife the last final water LRIP, but sinch finalter, from which vife

where the man is the first that which the first that which the first the first that which the first that the first that it is in all the parts neces refembling the first white Water Lilly, then any point weeds, which of fome have made it a period, and therefore I have placed it with them-

This greater yellow fort groweth much like the great whire, with leaves almost as large as they, but somewhat longer, and standing on cornered stalkes, the slowers also that stand on the toppes of the crested stalkes, are with thicke of leaves as the white (although Lugamen & doth to describe it, and giveth a figure answerable) in anythat ever I saw, but made of five large round thining yellow leaves, with a round greene head in the middle. ompaffed with yellow threds, which head when it is ripe, containeth within it greater feede then those of the white, and more thining a the roote is great and very like unto the former, yet not blackith, but fornewhat whitilhon the outlide as well as within; each of them being somewhat sweete in take, and this more loose or spongy

their.

The imalier, yellow Water Lilly.

The leaves hereof are round, but larger then those of the lefter white fort; and so are the flowers larger also, but pellow: the roote hash many trings faffened to a bigge head, and talteth hotter then the other.

7. Nymphea lutes flore misore. Small yellow Water Lilly with leffer flowers.

There is no other difference betweene this and the laft, but in the small neffe both of leaves and flowers, the roote

groweth with long ftringes ftrongly taftened into the mudde,

The Place and Time. All these forts except the second are found growing with us in sundry places of the Land, some in great pooles adstanding waters, and sometimes in slow running Rivers, other in lesser ditches of water, as the Frogge bit, in may ditches about London, as well as in the ditches on the Banckes side, in Saint diorges fieldes. They flower most commonly before the end of May, or soone after, and their seede is ripe in Angust.

Napola in Greeke, and Nymphas in Latine, good loss agnofe were, he enchaite appellations of these plants win their severall adjuncts, of also and severa white and yellow, and called Namehor in the Apothecaries shops, which is also divers other names by divers Authours: Applem ching it Advised Herculans, Alga pains in Paper pains of Clavis Veneris, and Digitus Veneris, and Marcells and the state of the Archiver, and Alga pains in Paper pains of the state of the Archiver, and the Apothecaries shops, which is also divers the Archiver and Digitus Veneris, and Marcells and the state of the Archiver, as the Archiver, and Winfer, the Italians Ninfer, the Spaniards Escudentes developed and Provide Correspondentes Sectionens, and waster Lilly. There had been the Correspondentes Sectionens, and waster lilly. There had been the proper and Theophrasses. Sectionens, and waster this Nymphas be not the Lovis Legistic participation of the one so necrely resembleth the other, which made Classis considering the Alphana his Allegation, in his Booke se plans a Egyptic determine them both one, when as there is showed two mained if recommended or rose was called Consistent described them both in two shorters, the one in the roote, that the law roote was called Consistent described them both in two shorters, which was used to be eaten, either both or rosed under the sire, which the mote of Nymphas failed in , (this samost provides to be etc. Lovis Alphana and like Miliom, that is round in the Lease there is and stowers inhorted being so siste, the other ring hid under the water caused Alphana, as he saith himselfe to ake no sutther knowledge or marke any difficulties in the mether of a Nymphas, (and I am halfe persuaded the like neglect hath happened to the Faba Legyptic beautic and the success of the success of the control of the provided the like neglect hath happened to the Faba Legyptic beautic and the success of the success o race in them then of a Nymphan, as he faith himselfe to take no sutther knowledge or marke any difference in them then of a Nymphan, as he faith himselfe personal to the suppose that happened to the Faba Egypta, that it is not yet found in the waters of Egypt, because the leaves thereofalso are round like the Lorm or Nymphan but now in his Booke of Excisive plants, he changeth his note, and showeth there that this is the true Lim Egyptia, and all the parts thereof particularly desciphered. At the control water Liliyes, are to called by all writers almost as I doe, and therefore neede no further experience of mynthestion. But, hereby all men may take a good cavear not to be too forward, either to condemse the Text of the sandener as judging it errorious, or to be too consident of their owne judgement, without we considering all parts: For the like here-into happened unto the Faba Egyptia, which formerly was considered in the Colocassis, ignorance being the cause of error, which knowledge since by industry hath corrected. The Vertues.

The leaves and flowers of the water Lillies are cold and moift, but the roote and Gedo's cold and dry: the caves doe coole all inflammations, and both outward and inward heates of agues, and to doe the flowers also either by the Sytupe or Conferve, the fald Sytupe also helpeth much to procure rest, and to settle the braines of

franticke persons for it wonderfully helpeth the diffemperature of the head arising from heate: the seede is some times used to stay fluxes of blood or humours, either of wounds or of the belly, yet, is as effectuall as the toore, but the roote is of greater use with us some taking the white roote (which is of the yellow fort) and some the roote of the white Vater Lilly, which hath the blacke roote, to be the more effectuall to coole, binde, and refraine all Fluxes or defluxions in man or woman, as also the gonort hea or running of the reines, and the involuntary passes of sperme in sleepe; and is so powerfull that the frequent as thereof extinguisheth Venerious actions: the roote likewise is very good for those whose uting is hot and sharpe, to be balled in wine or Water, and the decodion drunke: the blacke roote which heareth the white flowers; is more used with us in the etimes then the other, because it is more plentifully to be had, then that with yellow flowers: but the white roote of the yellow kinde is less pleasant, and more astringent and harshin taste, and therefore not without just cause doe most present it estimates the other to that womens stour sea, and mens stour sea, and mens stour sea, and the stours of the stour of the flowers wery effectuall for all the diseases arresaid, both inwardly taken and outwardly applyed sit is much commended also to take away freekles, spots, simbly menses, and the stours of the flowers, as oyle of Roses is made is profitably used to coole bet tumours, and the inflammations of all the diseases, and the paines, and helpe to heale the sores. The Frog bit as being a special as a water measure of the flowers, as one of the paines, and helpe to heale the sores. The Frog bit as being a special as a water measure than the open substantial and the special paines of the substantial of the value of the substantial there was another than the greater forts. But let no man militake the yellow Maria Maria of the yellow Maria last there was another kinde of Nemper, which was shar

CHAP. XXX.

Potamogeten five Fentalis. Pondweede.

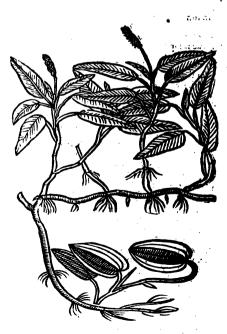

F the Pondweedes there are divers forts, more found out and referred to them then was in former times, which are these that follow.

1. Fontalis major latifolia unlearis. The greater ordinary Pondweede.

This greater Pondweede rifeth up with fundry stender round stalkes still of joynts and branches, and faire broad round pointed darke greene leaves with long ribs in them like Plantaire, set singly at the joynus and lying flat on the toppe of the water a state toppes of the stalkes and branches usually, and seldeme

Potamogeton five Forealismajor & minor latifolia vulgatis.
The greater and leffer broad leafed Pondweede.

ghe lower joynts come forth long spiked heads, of blush coloured flowers upon long footestalkes like unroughed Bistort, or Arsmart, whereon after they are past stand chassie huskes, containing within them blackish bedieted: the roote creepeth to and fro in the mudde, with divers joynts and tusts of sibres at them, whereby begare sattened to the ground. There is another of this fort that is lessenged so not with the sattened with the sattened so the sattened

The Theater of Plants.

This other greater fort different little from the former, but in the leaves which are longer and narrower, and the ribbes running acrosse in them, and not at length as the former doth, the spiked heads of slowers hereof are informed which is not at length as the former, and come as well from the upper joynts she toppes of the stalkes and branches. There is another fort hereof also, with leaves not altogether so long or altere.

The roote of this is joynted and creepeth like the former, bringing very long and narrow leaves at the joynts the fillers, and dented about the edges without any order on both fides; and beareth at the toppes such like

(pied tults of flowers and frede after them as the others doe.
4. Pot amogeton gramineum ramofum. Graffelike Pondwiede.

The flake hereof is a foote high or more, being very flender round and whitish, parted into fundry branches with many small grassity round darke greene leaves not set together, but by spaces a good way in sunder, which end in other leaves, that are almost as small as haires, yet not with standing from the wing of the first lease, comment of the standing that the like leaves at the end, and there as a small so restalke three inches long, sustaining comine small flowers, dispersedly see in a spike and not in a cluster, and small rough graines succeeding them.

5. Posamogeton minimum capillaceo folio, Small sine Pondweede.

This fine leafed Pondweede hath a very fine stender stalke, with small long pale greene, and haire-like leaves, settlereon without order, at the toppe whereof spring forth one or two small foorestalkes, which sustaineth a very smill and pointed head, like unto the precedent, sollowed by very small pale coloured slowers, whereof one is lid open, and another is inclosed in a skinny huske, ending in a point.

6. Potamogeton capillaceum capitulis ad also trissale. Triple headed Pondweede.

This Pondweede hath a stalke an handbredth long, no thicker then an haire, yet joynted and branched, and two saillong leaves at every joynt which are smaller then any haire, and thereat likewise stand very small pale coloridowers, which growing close, do forme a knot or head, which being ripe appeareth as made of three semicircular edding in a sharpe point, yet from the bosome of the former leaves, riseth a small stotestalk, divided into three or more small leaves, the like knot or head being set in the middle, for at the top there is no head the small state of the state of the small state.

The two first forts are to be seene in many places of the Land, no. Country almost being without the one or the sher, the third is more rare, and seene but in very few places with us, the three last are strangers and doe all shew this showers in the end of Angust or seldome sooner.

Liscalled in Greeke normano sermas squaft fluminibus vicina, and sax virus, quaft flicata Fontalis. The two first are generally called by all Writers Potamogeton, and by Lobel Fontalis of spicata, who it is very likely intended this first totand not a different kinde from it, although his figure have more pointed leaves, for the veines goe longwise, sin the former, which doe not in any other fort, although it doth expresse many small round heads on a long bile, and faith the flowers are white, and the seede like Apheca, and that his first fort is another species of the longisting flow the same, for we have seene some variety hereof in the Ponds and Waters of our owne Land. The third is colled Oxylapathum agnaticum by Lugidimensis, and by Gesur in bortis. Lapathi genus sproefere. The three lists mentioned onely by Bankinus, by the same titles they here hold. The Italians call it Potamogeto. The French eliment. The Germanes Samkrant. The Dutch Founteinerwit. And we in English Pondweed, Water Spike, and clome River wort.

The Vertues.

The Vertues.

The Vertues.

The Vertues.

The Vertues.

The Vertues.

Pondweed is cooling and drying as Galen faith, like unto Knotgraffe, but of a thicker effence: the decoction of the leaves in wine, stayeth the Laske, and griping paines of the belly, and being bathed, is good to helpe itches adulars, and corroding cankers and sores, the leaves applyed asswapeth inflammations, and Saint Anthonies fire, the fieckles and heate in the face: if the leaves be boiled with oyle and vinegar, and applyed to the place pained with the hot Gout, it doth give present ease: it is profitably also applyed with honey and vinegar to helpe those that have soule force in their legges, the roote helpeth to dissolve knots and kernels.

CHAP. XXXI.

Millifolium aquaticum. Water Yarrow.

Here be fundry forts of herbes that for their fine Fennell like leaves, and growing in the waters, to necrely resembling Yarrow or Fennell, are called Millefolium, and Famiculum aquaticum, yet differing each from other in some notable part, all which I meane to comprehend in one Chapter.

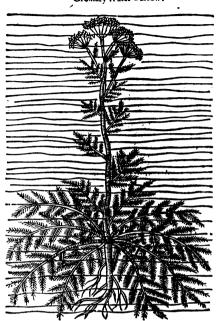

1. Millefolium aquaticum vulgatim. Ordinary water Yarrow.

This Water Yarrow which groweth most plentifully withus about London, riseth up with a round frught stalke, having divers long winged leaves at the bottome of it, cut and divided into many fine small leaves set on both sides of the middle ribbe, like unto the land Yarrow, but much tenderer and with as fine leaves almost as Fennell it selfe, at the stalkes likewise grow such sine leaves up to the toppe, where stand on branches, largetures of small white flowers set close together, the roote is somewhat long white and stander with divers force at it.

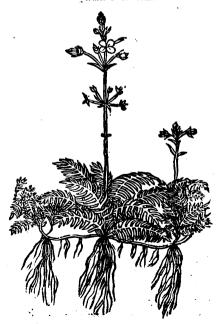

2. Millefolium Coriandrifolium. Broad leafed water Yarrow.

The lower leaves of this Yarrow are somewhat like in the forme and divisions of them unto the lower leaves.

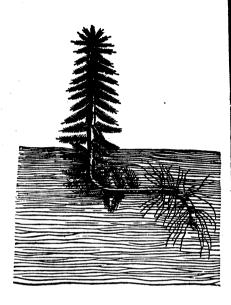

1. Millefolium aquaticum vulgatius. Ordinary Water Yarrow.

4. M'llefolium aquaticum floridum frue Viela aquatica. Water Gillotlowers.

TRIBE 14 3. Millefelium aqu atienm mium. Small water Yatrow.

5. Millefolium aquaticum Ranunculi fiere & cepitulo. Crowfoote Millfoile,

of Gorianders, but much simaller and of a fresh yellowish greene colour, but those that grow from thence upwards on the stalkes, are smaller and more sinely cut in like unto Fennell, bearing umbels or suites of yellowish slowers.

This small Yarrow spreadesh many long round greene stalkes stall of joynts, and thereat sundry sine small stress which take hold of the ground as it creepeths the upper pairs of the stalke that rifeth above the water, but fire of sin joynts, and at each of them sundry sine small green leaves scarse an inch long, being less and less upward, so the toppe of the stalke steemeth to be steeple fashion, which beare at the toppe so many very small slowers, consisting of eight small white leaves apoece, joyned together and not opening themselves, as there are leaves at early joynt, which after wards passe into certaine round heads, which have source spokes or points apoece.

All this is a specific or sundry spokes or points apoece.

The roote of this Water Gillover is very small and creeping shooting forth fibres every where from which rise apstudy long winged leaves, consisting of many small leaves set on each side of a middle rib, which are larger and easier then those of the first bere set forth, of a sid greene colour, the stalkes that rise up among them are bet of leaves, from the bontome to the upper joynts, whereabout standarders small whitish and sweets showers,

intofleaves, from the bottome to the upper Joynts, whereabout stand divers small whitish and sweete flowers, somewhat like unto Stockegilloshowers, of five leaves a peece, one row above another, with yellowish threds in the middle. There is another forthereof very like it, but that it hat larger winges and finer jagged leaves.

5 Mileselium aquaticum Rammenli flore & captinlo. Crowfoote Millsoile.

This is lesser then any of them that goe before growing onely in shallow waters, where it seldome rightness an handfull high, with very many and very sine short leaves, as small as Camomill, and of a yellow-life gone colour, the short stake among them carry single small white showers, resembling the water Crowfoote with short stakes and sinks state that he have a bread leaves as the become as it hath, and mich a small shallower and sinks state hath and mich as a wall bein the flowers, and in the fine reaves, but bath no broad leaves at the bottome as it bath, and might as well becomed a Crowloose, as a Water Millfolle, but that all Authors that write of it doe number it among them, doubly because that beareth a head of feede after the flower is pak, very like unto those of Crowfoote, that is imil bunch of feeder fer close together.

6. Millefilium maratriphyllen Rannaculiflere. Fennell leafed Crowfoote Millfoile.

Thereone hereof is very long and creeping, the stalkes grow much higher then the last, the leaves are much longer side greener, very like to those of Fennell, the flowers are white but much larger then the last, the head of side being somewhat like unto it.

7. Afile folium aquaticum pennatum fricatum. Feathered Millfolle.
This Millfolle fendeth forth from a buffly librous roote divers round joynted stakes, hollow, striped and brandeduthe toppes, fwimming on the water a cubit high, and at each three or foure leaves to finely cut that they femeto be feathers, of a browne greene colours at the toppes of the fialkes come forth long purplifs fpikes, sit were containing fundry knots of finall yellowish flowers, fet one above another by spaces, after which come fall blacke and very hard heads, four or five together about the joyat, in the hollow part whereof lyeth the

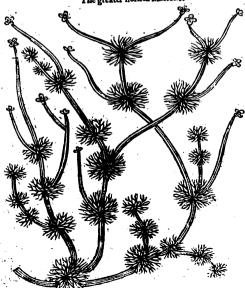

8. Milefolium aquaticum communum majus. The greater horned Millfolle.

This likewise hath sandry slender and brittle joynted stalkes swimming upon the water a cubit high, with mayine thinne and small leaves compassing them at the joynts, whereof the lowermost are jagged like a Harts lame, but upwards they are since, from the joynts also rise small slender sootestalkes, three or source inches long.

7. Millefoljum equalism pennatum fiftratum. Feathered Millioile.

8. Millefolium aquaticum cornurum majus. The greater horned Millfoile.

PPPPP

9. Millefolium aquaticum flore luteo galeriquiata Water Militoile with a yellow booded flower. . 10. Stelleria equatica. Staire-like Water Pennell

tome what like hornes, bearing at the toppe of each a small white flower, made of fourt leaves a perce, and after them a small head, with divers seedes set together like a Crowfoote. Baubinus in his Appendix to his Pinax, maketh mention of a fort hereof, much leffer then the other, with small leaves like theirer and short, sothat the whole wing of leaves fer together, doth not exceede one leafe of a Lentill.

This hooded water Millfoile hath divers long leaves is fluing from the roots Typing within the wastr, made of many parts set on each side of the middle ribbe, each part consisting of many very similar their greene Fennellike leaves, set as it were in turtes, one against another: the stakes rise tip tome what highs and reddish, without any leafe on-them, but with surdry pale yellow flowers, set in a gainst affiliance, sine from another; from the middle almost to the tappe, which showers consist of three leaves, the middle most water of as as it were shooted, before it be blowne open, but then is the broadest, and round at the end with a dent indice middle thereof making it represents the towns of an Harrest is unfaith enough as the architecture. it represent the forme of an Hart as it is usually expressed on the cardes.

10. Stellaria aquatica. Starre-like watef Pennell. Vnto these Water Millfoiles is adjoyed by Lobel and others this water Fernelly thing from along fibrois roots sendeth forth fundry weake stender and steakers and steakers and steakers in the water for the forth fundry weake stender and steakers and steakers in the tomes to the toppe, having two small sine leaves like those of Fennell claims, for a transport of them, and at the toppe of each a small white flower, consisting of eight leaves, laid of the steakers and whence rose the

The Place and Time. All thele grow in the very watern divers of them being often found in our owne land. The fift whereof is the m. It trequent and the fourth and filter next unto it, but the second and third are firm as the rest that follow are, and doe all flower for the most part, in the middle or in the end of Sommer,

Dioscorides and Galen call it in Greeke pupioquano Myriophyllum from the abundance Chaves that & bath, even a million as the word importation and Millefolium in Latine. Some as Mathiolus fleweth, would referre our Millefolium which is a Land berbe uned this Myriophyllum of Dioscorides, but the there sheweth their errour. The first here for forth is Matthialus his first Myriophyllum, and called by Dodonaus Millefolium aquatile, by Lobel Myriophyllum ant Maratriphyllum, and by Baukinus Millefolium aquaticum muscllainus capillaces brevisque felio. The second is Matthialus his Millefolium aquaticum, set to the Chapter of Stratiotes, in his Diascorides, which Lugarians called be supported to the Chapter of Stratiotes, in his Diascorides, which Lugarians called be supported to the Chapter of Stratiotes, in his Diascorides. dunenfis calleth Stratiotes millefolium aquaticum, and Banbinus doubteth that it was a figure made of two herbes and lent to Matthiolus, for Lobelin calling it Millefolium aquaticum alternus Carigon folium, doct rather referre it to the upper fine leaves then the lower of Coriander. The third is called by Classic Revisely for minus. The fourth is the Viola aquacilis of Dodonaus, the Myriophyllum aller pine of Millefolium and Lugamenter.

and the Myriophylloweginfoffshim. Haviatile of Lobel. The fifth is called by Lubet Millefolium maratriphyllon flore of semine Rannatush advances Floratice fucie, and by Clusius Millefolium aquaticam fine also, Cesates in horeis calleth it Alga painst ris five stavioritis, and is the first Alga of Tragus: The fixth is the Myriophyllum maratriphyllum faister alterum of Lobel, Existine Runnington aquaticum Dulechampy of Lugdunensis, but badly figured, and the Peucedisam aquaticum of Taberquestanus. The seventh and eighth, are onely mentioned by Banhissus. The ninth is listin aquaticum of Larerysonianus. The leventh and eighth, are onely mentioned by Danishus. The binin is called by Lobel Millefolium aquaticum five luteo galericulato, and Fæniculum aquaticum galericulium by Taber-moutanus. The last is the Hellarianica of Lobel, and the Fæniculum aquaticum Stellatunios Tabermoutanus. The Italiani call it Ministile, the French Gyrostees del can: the Dutch Water Violseren, and we in English Water Yarrow, water Milkoile, water Gillovers, and water Fennell.

The Water Millfoile is of such a binding and astringent cold quality as Galen saich, that it healeth wounds and assume the heat; and inflammations of them, and as saith Dwsfeorides, it freeth wounds from inflammations, being applyed fresh or dryed with Vinegar, it is also given with vinegar and sait, to them that have had shrewd buffes or falls from force high place dit is likewife raken with vinegar to helpe them that cannot make water, and the other griefes in the bladder, cafuall fighings also and the Toothache.

CHAP, XXXII.

Alfine aquatica. Water Chickweede.

Here are divers forth of Chickeweedes that grow in or neere the waters, that were referved for this place, and there are others that are left for the Sea, to be entreated of there.

This greater Chickeweede hath a creeping roote, shooting out fibres in divers places, from whence (pring up fundry upright stalkes, joynted from the bottome to the toppe, and two some-what long leaves at every joynt, somewhat like those of Pelleton, of the Wall, and at the toppe di-

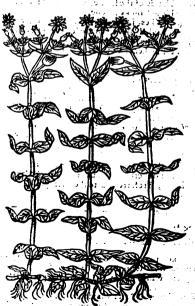

res white flowers like Chickeweede, having many small and pointed leaves in each flower.

The meane Chick weede hath from a fibroita roote stundry stalkes rising up to a yards height full of branches and fall long leaves on them, of a pale greene colour, the flowers are many, small and white, made of five leaves a pecce standing at the toppe of every branch.

3. Alfine aquatita minima The least water Chickweede.

This lefter Chickweede hath a number of small tender branched stalkes, and small leaves growing on them, thicker fet then in the former, , but lying for the most part, on or neere the ground or in the water where it grow-

. A'fire aquatica five paluftrii major. The greater water or Marth Chickeyeede. 3. Alfine aquatica minima. The least water Chickeweede.

5. Alfre pulaffri miner Sergilifolia. Small . Marth Chicketecde.

Alfaroche forcavalee. Vpright blen Chickweede.

eth, the flowers are finaller and white, and the roose a tuft of many fibres.

4. Alfine aquaticamimor felse oblengo Bue Portulaca aquatica. Water Purlane.

This small Chickweed or Purstane groweth like the last Chickweed, with many trailing branches, that take roses as they ipread, but not to thicke let with leaves, which are formewhat long narrow and round pointed, of a pale

greene colour, two alwayes growing at a joynt, the flowers are final and white, fit in long cinflers together, on small footestalkes, with very small feede following them, the rootes are nothing but small threds; on small footestalkes, with very small feede following them, the rootes are nothing but small threds; on small footestalkes, with very small seaves thereon by couples, lesser than those of Serpillism, of Mother of Time: after the spreading, with very small seaves thereon by couples, lesser then those of Serpillism, of Mother of Time: after the spreading, with very small seaves thereon by couples, lesser then those of Serpillism, of Mother of Time: after the spreading, with very small seaves after compall state on each side of the stalke, with small seede therein.

This Chickweede riseth up for the most part with divers upright salkes, joyned is fundry places, and sivers small leaves growing thereon at the several joynts, somewhat divided like unto the leaves of Rue, or somewhat resembling a Trefoile lease. at the toppes, as also at the joynes come forth small blew showers, consisting of what refembling a Trefoile leafe, at the toppes, as also at the joyatt come forth small blew flowers, confiling of four leaves aprece, after which come small round Chickeweede like heads with frede, the roote is white and long, with some fibres thereat.

The Place and Time. All these forts grow in or nee: E Waters, and are found in fundry places of the Land, flowring in the heateof The Names.

Tabermontanu and Gerard from him make mention of most of the toftes. The fourth Banbinn faith was fent Sommer. Tabermontania and Gerara from him make mention or most or times tors. The fourth manning latt was talled him by the name of Portulaca aquasica, yet calleth it Alime palufris minor poins obligies. The fifth he also calleth as it is in the title. The last was called by Tragus Headlekraus, not well knowing what rifle to give it, having the leaves divided somewhat like to ones hand, and that made Thalism also to call it Thalish between cerules fore, Luydaner for faith that some in those parts called it Elatine triphyllos. The remaining called it Aligne relia, and so doil Gerardalfo, but Baubinus Alfine triphyllos cerulea.

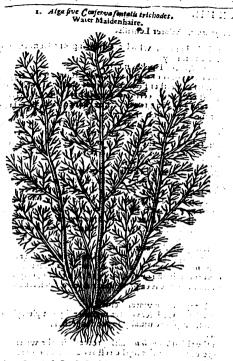

The Vertues. The properties of these Chickweedes, are no doubt like unto the other Chickeweedes, their place of growing forme and tafte being infipide, warery and cold, declaring the fame, and therefore what over may be faid of their is to bee found among the other, and therefore to avoid repetitions, a referre you to the reft spoken of before, where you may be abundantly fatisfied.

CHAP. XXXIII.

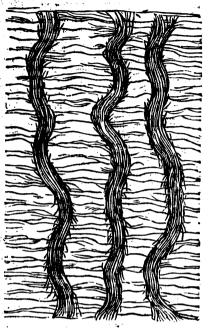

Alga aquatilis & Conferva. Fresh Water Bertellences.

Here are an infinite number as I may so say, of Sea Excresses, called by fundry names as you shall further understand when I come to speake of them, which I would separate from those that grow in the fresh waters, and entreate of these in this Chapter, which who be called whereby to be called whereby to be called.

1. Alga five Conferva fontalis trichodes: Water Majdenhaire. The water Maidenhaire groweth upon the stones in the bottome of springs, fastening it selfe thereto, and from

. Alea chuatilis Cal-illacea five Conferva Plinij a'tis Linum aquaticum. The thieddy or hairy water weede.

mence shooteth forth fundry fine greene stalkes with many fine threds on them, of a cubits length sometime. growing (mooth out at length, and fornerimes foulded one within another, without any other leaves upon them which when they are dry turne to be somewhat browne, and are of little or no talte at all.

which when they are dry turns to be somewhat browne, and are of little or no raste at all.

2. Alga aquasitis Capillacea five Conferon Pliny, ally Linum aquasicum.

The threddy or hairy Wardr weede.

This Warer weede groweth from the mudde in the bottome of takes and other standing waters, and sometimes indow maning Rivers, which is wholly composed of a number of greene brownish threds or haires joyned together, storing therein, passing and waying to and fro all the length thereof, as the current of the streame runthor the winds distribution, and are sometimes a yard long or more.

This likewise groweth from some small stone in the bottome of the cranckes of water never the Sea shore, to be oftworable in length, being mathric life then a number of this sea from the most hand blackish long strings, solded one among another, and hash neither spore leafe nor flower.

This excresses in the three shore a long and much spread locke of soft Words or Cotton, growing close together, spreading same wants between of a stalk greene colour on the upperside, and whicish underneath, and swimmeth on the most of the water of the circumstant process of the content, and swimmeth on the upperside, and whicish underneath, and swimmeth on the upperside, and whicish underneath, and swimmeth on the upperside strength of the same passes, some not save or this circumstant process, and as the process of the winds in pooless.

Place and Time. The most of the fa does row in tile of and pounds, time not farre of this City, and others in other places, and are the flame in the Sannian time of the flame in the Sannian time of the flame of the flame. Adding upon the Waters. Engagement faith that the feeond was found in the greatest lake of the flame, the flame.

The Names.

The first is called by an decomposition of the Names of th The Names.

Pliny hath recorded that he knew one cured incredible quickly with his Conference a fall from a tree, while he was lopping it, which fall brake almost all his bones, by having the herbe bound to his whole body when it was helh, and moistened with the water thereof, as often as it grew dry, and but settlesse changed.

CHAP.

CHAP. XXXIIII.

Lens paluftru, five Lenticula aquatica. Water Lentills.

Here are three or fours herbes to be referred to these Lentils, which are differing one from another. their place of breeding being their chiefelt cause of affinity. 1. - Lens paluftru five aquatica unigaru. Duckes meste.

This small water herbe consistent of nothing but small round greene leaves, lying on the topic of standing waters, in ponds, pooles, and ditches, without either flower or keed that ever could be observed, onely from the middle of each leafe on the underside, there grow certains small threeds finer than haire,

rerveo, onery from the mindle of each lease on the undertide, there grow tertaine impairmed inter than haiter, which passe downe into the water, but are not thought to descend to the ground from thence to draw nourishment. Matiliolus (and from him Lugdmensis) reporteth a strange narration, and I may say incredible; That if it should happen (as sometimes it comments to passe) by inundations, that these small Lentils or Duckes meate te carried our transfer and the strange of the stra ried away into running rivers, as foone as they cleave to the flore, they are wonderfully encreased i for by the rootes that will grow from them like threds, they fasten themselves into the ground and then growing, becommeth to be plantes like unto Sifinbrium water Mintes, or Ladies smockes, and that this thing hath beeze observed by diligent fearchers of nature, not without much wonder of the matter : feiliers.

2. Lens palufiru five aquatica quadrifolia. Croffe leafed water Lentils or Duckes meste. This other Lens hath a small long slender roote shooting forth square slender weake and trailing slakes, with souther Lens hath a small long slender roote shooting forth square slender weake and trailing sales, with square standard states of states and trailing souther at the joyate' district one from as other, which are parted into soure leaves a peece, and sometimes it hath beene observed with skileaves, each end being round and lying in a square forme like a crosse upon the water : at the joynts likewise with the jeaves come forth diverse small heads or seed in clusters, wherein are enclosed small blackish seede like under the fields Leads, but not to flat, being thicke and hard. Lagdunenfis fetteth forth this kinde of water plant, by the name of Linear Teophrafti,in a much differing manner.

Lene paluftrie latifolia punttata. Broad leafed spotted water Lentils. This water Lentill hath fundry round leaves fet by couples on long stalkes, of an excellent greene colour on the upperfide, prickt very full of very fine spots, and under them many fmall Lentill like heads cleaving unto them, fome having but one others two three or foure at a place, covered with a rough or sugged thin buske, very full of fine small yellowish feede: at the bottome of these winged stalkes of leaves grow the rootes, which are a suft of

The water, having feede vessels growing hard unto them, four usually joyaed together.

The sessels of Maples, but he very fine long stender stalkes, with leaves fee together by couples, lying along upon the water, having seede vessels growing hard unto them, four ensually joyaed together.

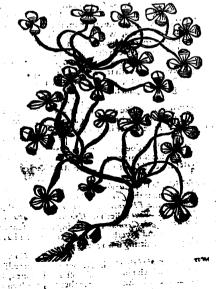

The first construct the sessels of the sessel

The first onely of these is familiar in our land as I take it : the third Banbins saith, groweth in the watery disches at Pados, in the river Anxeris by Pifa, and in Silefia neere unto Uratiflavia, the rest are all strangers, and un Silefia neere unto Uratiflavia, the rest are all strangers, and un their freshest beauty in the beginning of the yeare.

CHAP. XXXV.

Baftard or unfavoury Cyperus.

N the end of the first Classis of Tribe of this Worke, I have shewed you fundry forts of sweete smel-ling Cyperus: but there are many other forts that smell not at all called either bastard or unsavoury Cyperus, formewhat refembling the (weete forts, both the round and long rooted Cyperus, and there

Cyperus, formewhat refembling the sweete forts, both the round and long rooted Cyperus, and there are Graffee allo growing in the moorish places like unto them in roote or leafe, and therefore called Cyperus Civilies. Of the former forts called Vnsavoury Cyperus, I meane to entreate in this Chapter, and the fem following.

In some contest of Cyperus hath divers long and narrow rough three liquies leaves rising from the roote, enclosed cyperus hath divers long and narrow rough three liquies leaves rising from the roote, enclosed constitution in the state of the bottome, from among which riseth up a three square Italke foure or five long in the state of the stat

Inisother large control of the large state of the l

1. Cypirus langus enederas. Valavoury Cyperus with long rootes.

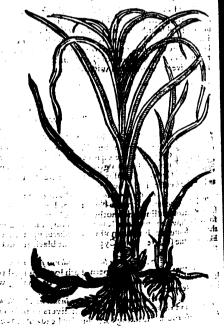

4. Copirus rotundus littoreus inodoras Anglicus alter Another round rooted unfavoury Sea Cyperus.

3. Cyphus rotundus littorenzinodorus Anglicus. English unfavoury round rooted Gyp. rus.

Cypirus rotundus inodorus aquaticue. Vnfavoury round rooted water Cyperus

hille also is three Phane, two foote high and more at each upper joyne whereof with the leaves come forth long doit heads, the whole plane is utterly without fent at all.

doit heads, the whole plant is utterly without tent at all.

4. Cypirus refundus littereus insdorus angliesus alter. Another round rooted English Sea Cyperus.

This other English fort is nearly fike the last, bods in repotest and haves, but differether on it in this, that it hat it hat it to the tops of the stalkes once or four blackish fearly biness fat together at severall places with the serves.

5. Cypirus respondis insdores aquaticish Seilayoury water round rooted Cyperus.

This sort of Cyperus that sind fundry blackish round rooted feel with sorny small filters as they present in the ground for long near thickish for the form of the fundry blackish and stalkes, with the sorny at the toppes we exceed with the sleaves,

one forth long parameters, cone forth long parameters, cone forth long parameters, bridges a aquation alter, Another Valayous water sound rooted Cyperus. Another Villavours waret sound rooted Cyperus.

This Cyperus is very like the last fort in the rootes, being fortwhald one and round like Olives, and many fibres at them but the leaves a complete longer, and the stalkes share the longer and the stalkes share mounted on the complete are the derivative of the last of the longer and the stalkes share the last of the

Theirst is often found with the borders of fields at mooth y the fecond in Germany, the third and fourth it are conts, in divers places both of Slapey, and Thomas in Laund in other places, the fifth on the banckes and in the time of the investigated by Interespe, and the last being fully in the low mar they beyond Rateliffs, and are in tender inthe end of August.

The first is called by Lobel Cyperus longus inodorus sylventy, and by Asubissis Cyperus longus inodorus sylventy longus inodorus sylventy legicond he calleth as is is in the title. The third those algebras returned inodorus littatyses. Cofalpinus by the cyperus, saying the Alorustinus callet Noolo and Baubinus Cyperus returned inodorus littingstander doit, that that I adde lumen thereunce, and tempe both it and all the rest Cypirus in the calculation, and the property of the last, chiefly differing in the toppe heads, which Baubinus calietts Germanium, and saith that because the figure of Lobels aquaticus Settationalium, which is manifelibrate and falth that because the figure of Lobels aquaticus Settationalium, which is manifelibrate and falth the Et out this in, and lattic little because the right of Does management of Streaminalium, which is supplified by the fire out this site right, but this differentiable in recess and heads from it and agreeing better with the former, which is my third

The file is the life is the life is the long and indicated by any before.

All these forts of unitariously Coppers, doedeclare that they are as defective in heate and devotele, as in sent from the sweete kinder, and therefore feeting thing I can learne are not used for any purpose in Physicke.

Gramina Cyperoffea. Cyperus like Graffes.

there are so many shorts of these Cyperds like Grasses that I know not well how to divide them, and therefore main terchions all theethers in one Chapter, and speake as briefly of them as I can, I. Grasses in product supported and latifolisms. The greater fort at Cyperus Chasses. (Lobot I in greater Cyperus Chasses have a long leaves like unto those of Reedes, (Lobot Saith like unto those of William and the same above another: the roote a brownish and building is elife one within another with many fibres awhere. Of this fort there is another, called by Dashings, Grasses Cyperdias la-Alexum. Instantificate third major, whose roote are more bushy and fibrous, and the spiked heads more green, having a long narrow leafe under the lowest head.

3. Grasses Cyperdias missesses untificities. A crear fore of Cyperus Sails with heads where the control of the sails and the sails and the sails.

a. Gramen Cypaneides majurang uffifolium. A great fort of Cyperus Graffe with marow leaves.
This other different little from the last, but in growing lower, with narrower leaves and spiked heads, that are

things and fibres that he room for the like Cyperus.

This lefter for that he are browning greene colour with it.

This lefter for that he are owner leaves and three square stakes, bearing smaller and know spiked long though, at the toppes, three usually set together one a little from the other more stiffe also and surrepts, the score hash lings and fibres thereone, shooting forth like Cyperus.

A. Pleaderphia spike spice brevi pendala. Bastard Cyperus with foot plantings heads.

This assaud Consequence assaults consequently like upon the true long Cyperus having large spikes of the same spikes.

This Baftard Cyperus groweth fomewhat like unto the true long Cypenis having large and long graffic leaves.

6. Cypirus resultani froddymaguaticus alteri Agoth r unfavoury water gound adoted Cyperus.

Gamen Coperoides majus latifullum.

3 Gramen Cyperoider minus fricatum querfifolium. The lefter Cyperus Graffe with leng ipsken kends.

4. Copious five Pfraderperus foies berifendele. Baftord Cyperus with there fendulous bonder.

6. Gramen Cyperoides patuftris paniculafferfa.
Marth C perus Graffe with sparled heads.

And Green of Antonia Control States of the Control of the State States of the States o

Tribuil.

is manner three feinate, and folia the halic allo, at the bowkereof from among divers leaves come forth great out thicke and fhort heads hanging downewards, every see by a fhort footeflake's the rooses the wife doe force and not folial the true fweete long Cyperus, But looker and not forme, fuller also of fibres and not finelling tweet all.

5. Gramen Cyperoides spica pendula longiore.
Another fore of Baffard Cyperus graffe.
This wild Cyperus graffe hath a cornered striped stalke, but two cobits high, bearing long and marrow leaves sneen; which compasse the stalkes of the borrowine, with a since or hollow sheath, and hath several long and narrow readous heads at the toppe, sive or fixe inches long a succession leafe under each head.

Accounts a long leafe under each head.

6 Gramen Cyperiolles palastro panicula sparse,
March Cyperus Graffe with sparsed heads.
The leaves of this Cyperus. Graffe are long and somewatnarrow, hard and cutting on both edges, the stalke
stall without any leaves thereon that of the toppe, where
lawestetwo long leaves and verty narrow, spread forth
bits flight footestalkes, bearing each four or five small
sughteads: the roote spreadeth somewhat like the true
(preus, but harder, fuller of blackish fibres and without
kell.

7. Gramen Cyperoides paluffre major.
The greater Marth Cyperus Graffe.
This greater Marth Graffe harh fundry long and martown hard cutting leaves like the laft, and among them di-

mrail upright naked stalkes, without any leaves on them at all, each of them bearing a long round and some-mrail upright naked stalkes, without any leaves on them at all, each of them bearing a long round and some-but large rough prickly head wherein lye the seed; the roote is a bush of many blackish sibres like unroa Grasse.

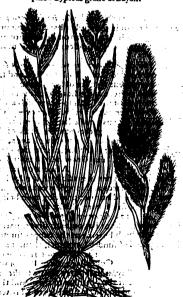

8. Gramen Cyperados palastro minus. The setter Match Cybering traffe.

This lesser for is like and the greater but smaller, the stalke beginning sharper rought spiked heads, source or five bother one above another on both sides thereof, with a long lease at the soote of them often imes.

12. Gramen Cyperoldes spicatas fosca elegantissima panteula Baimense. The fine browne spiked Cyperus graffe of Bayon.

9. Gramen

TRIBEIA.

13. Gramen Cyperoldes paluffre Balonenfe. Marfir Cyperus Graffe of Boyon.

14. Gramen Caparaides Bayonenfe Ifehand pennienth fufch.

The Cyperus Graffe of Bayon with browne Cockes foote pannish.

9. Gramen Cypereides ficis minut compatiu. Marth Cyperus Graffe with more open heads. The roote hereof is somewhat hard or wooddy and full of fibres bearing many long and narrow leaves like to Graffe, among which rifeth a rough three square stalke bare of leaves for the most part unto the toppe, where ftand feverall small rough heades or spikes, more loose or open then the former, having sharpe pricking feede within them.

10. Gramen Cyperoides panicula sparfa subflavescence. Yellowith open headed Cyperus Graffe. This yellow headed Graffe hath fmaller and fhorter leaves and naked failtes then any of the former, besting at the toppes betweene two fmall long leaves, a head severed into many small, parts or spikes of a yellowish colour: the roote is great at the head with divers fibres thereat. Of this fort there is another differing links from

wigntante. it, but in the colour of the small spikes which are blackish.

11. Grames Cypersides Danicons glabrum felips Carpophyllein. A Danish Cyperus Grasse. This Danish Cyperus Grasse hath diversitalkes with sundry narrow stiffe and smooth leaves, three or some inches long apecce, fet together at the middle of them, from among which rife naked fhort stalkes, bearing at the toppes from betweene usually two long leaves, diverse small long spiked heads, spread like those of Rushes, of brownith greene colour: the roote is flender creeping under ground, thooting forth in divers places.

12. Gramen Cyperoides spicata insta elagantissima panicula Bajonense.

A fine browne spiked Cyperus Grasse of Bayon.

This fine spiked Cyperus grasse hath sundry long and narrow leaves among which rise up three square stalkes joynted in divers places and long leaves at them, with whom towards the toppes come forth long bushing spiked heads, somewhat hard but not pricking each being two or three inches long of a very fine pale brownish colour the rootes are a bush of many thicke strings.

13. Gramen (yperoides palustre Baionense. Marth Cyperus grafte of Bayon.
This Cyperus grafte of Bayon, hath divers narrow long leaves, both below and on the small stalkes, which are about two foote high, bearing at the toppes fundry long and tharpe prickely heads with long leaves at them, the roote is composed of fundry long thicke strings and fibres.

14. Gramen Cyperoides Bayonense Ischemi paniculin fuscio.
Cyperus grasse of Bayon with browne Cockes foote pannickles.

This Graffe of Bayon hath three fquare stalkes almost two foote high, and very long narrow leaves even a foote and a halfe a peece at the bottome of them, and the like allo at the joyats, with whom towards the topper constant language language. forth very long and flender pannickles of a brownish colour, being three or foure inches long and of the thickness of a Moufe taile, fometimes but one at a joynt, but ufually two, and fometimes three, the rootes are a bush of many greater ftrings and fibres at them.

All thele fores of Grafies grow in low most and moorish grounds many of them as well in our owne land as in The Place and Time. others, divers also have their severall pisces exprissed in their sieles, and dee all flewrish and seede in the end of Summer.

The Names.

From the likenesse as I said unto both Cyperus and Grasse in leaves or rootes, be all these sorts entimied Craes mula Gramina. The first whereof is the Gramen Cypersides of Lobel Cumerarism and others. Biashbur taketh it methe Gramini guarrum session of Tragus, which Lugdamensis calleth Carex Tragis: but in that Tragus saith, his mether cannot be both one plant. The second is by Banbinm called Gramen Cyperoides angustifolium spica spa-imethry cannot be both one plant. The second is by Banbinm called Gramen Cyperoides angustifolium spica spaher girld minut, as the other fore of the first he called Latifolium majus. The third hath not beene described by ins with many as the state fort of the first he called Largolulus major. The first hat not been described by meletore. The fourth is the Pseudocyperus of Lobel, Gester and Dodones. The fifth is described by Bankinus with Prodromm under the twelstift kitle. The lixth is the Gramen Coperoides aquasicum vulgatius of Lobel. The furth is to called by Lobel as it is in the title, but Thalius called it Gramen Inncenment questrums. The eighth is diedly Lobel Gramen Coperoides parving aquasicum. The thinks is to called by Bankinus as it is in the title, and to inhe tenth also, but faithful is the Carex misses of Lonicerus, and the fourth Columners in of Tragin, which Luginterents and the chird place and figure, as allo his Inness extens practice of the Granien marinum friedents patterns practice. The fourth last forts have not beene fet forth before now. The Versues.

The Versus.

There are none of the Graffes pfed for man or beaft that I can learne being most of them frame or cutting Graffer but especially unprofitable for any Physicall use.

CHAP. XXXVII.

Gramina lance avida Bin, Aguasion, &c. Rush-like Graffes of the Marshes, Waters, &c.

sycal N the former Clefffs' I howed you divers forts of Ruth-like Graffes, that grew on the upper grounds, in this I means to exhibite those of the lower, and indifferently dispose them together, whether they be naturall to the Marshes, or Mootis Brounds, the waters, or the Seaf, lides.

It of the Marshes, or Mootis Brounds, the waters, or the Seaf, lides, it is a finish the feedes in clusters.

This Ruth graffe that but few Imali Ruth like leaves, riting from the blacklish thready roots: from among sideounments up directs stalkes a cubit high hearing at the toppes Betweene small long leaves a small head, forattlike unto a bunch of grapes, wherein lie the feede.

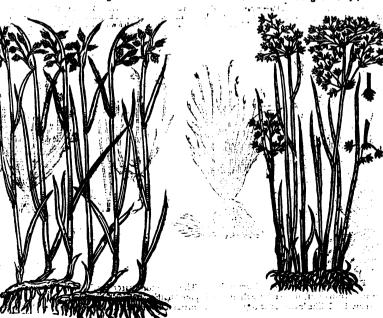

mediate unto a month or grappes, you the the tree tectes.

Gramen Inner manifestations against some capitale squamos a larger finall water Rath like graffe.

This small water Ruth graffe, thich a few, but smaller leaves than the former, being about two inches long a seath stalkes are foure or five house high seach of them bearing, a small scaly residish head, with the toppe of stellake appearing above it: this is not that fort is expressed in the former. Classis among other Rush graffes. Thre is another somewhat like hereunto, but that the stalke appeareth above the head, which is not scaly.

Gramen aquaticam Junceum vulgare. The Common Water Rufh graffe.

4. Gramen Iqueceum aquaticum magis fparfa panicula. Another water Ruth graffe with joynted leaves.

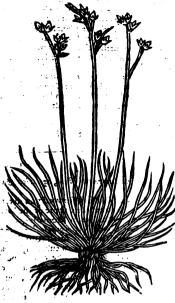

TRIBE 14.

5. Gramen Innecum aquaticum Baubins felio priteuleto er cum urriculis. Haubinus his double forme of Water Rush grasse .

6. Gramen Museum maritimum majus, The greater Sea Ruth-like Grafte.

7. Gramen tunceum marinum denie fripatum. Thicke Sea Ruth Gralle. 9. Gramen Iunceum exile Plimmofij. Small Rush gratic of Plimmouth. 10 Gramen I necum magin exile pauciful um. The leffer Ruth graffe with few leaves. 11. Gramen junceum minimum Hatofrio Matthiolicongener. The imallest Rush Grasse like the former Toade grasse,

3. Gramen I success aquaticum vulgare. The common water Ruth graffe.

The common water Ruth graffe thoughth forth fundry joynted ftallog, from long there in the winter like what like wha

4. Gramen lunceum aquaticum magis sparsa panienla. The other water Rush grasse with joynted leaves.

This other water Rush grasse is very like in the growing unto the last, the chiefest differences be in the stalkes; that are greater and tise higher, in the leaves which are joynted like three the wood Rush grasse, and in the tops which are more spread with small heads.

The Theater of Plants.

I have hereunto added this double formed kinde of Rush grasse of Rush grasse of Rush grasse, whereby he would correct that Gramen aquaticum alternative which Lobel and Tabermontamin fee forth, because the leaves had no joynts in them as he saith the true fort should have, (but is gather another fort as I chinke,) for having given one figure with many small rusts or heades, such as it beareth in the summer time, he showest another, that the saith after hay harvest, shouter forth another had talk with certaine chasses, parted into many threds, and seldome beareth them any such like heads as the former on it; not having seene his sort, I can no further judge thereof, but give you my opinion.

into many tirreus, and tendence occurrent there may have made a state to the control of the cont

7. Gramen Inncents maritiment dense stipetum. Thicke set Sea Rushlike grasse.

This other Sea grasse hath long hard leaves like Rushes, growing thicke and close together, the stalkes are stander much longer than the leaves, every one bearing a small head at the toppe like unto a Rush, whereupto the roots like also.

8. Gramen Inncents maritiment minimum Zelandicum! The least Sea Rushlike grasse of Zeland.

This whole plant fearfeex exceled halfe a cubir in height, but foreadeth like a finall tuffocke from each feverall more, whereof rifeth a fingle imall talke, with imall hairy like leaves therewith, & a finall thicke head at the top.

9. Gramen Inneum maritimum exile Plimofis. Small sea Ruth are fig. of Plimofis.

7. Gramme Innecess maritiment exist Plimoffin. Small Sea Rufh grafte of Plimonoush.

The leaves of this small Rush grafte are many growing thicketogether, and as fine almost as haires or threds, smang which rife up fundry slender unjoynted stalkes, bearing exceeding small sharpe pointed heades thereon, the stalkes appearing above them, and pointed: the rootes are many small long fibers. This was so and as well at Pimonous as Dover in their wet grounds.

10. Gramen Inscens magic exile paucifolium. A lefter Ruth graffe with fewer leaves.

This small graffe hath fewer and shorter stalkes and leanes than the last, more fost also and delicate, whose heads are little bigger and prickly, and the stalke rising above them as in the other: the rooters small and stender.

In, Gramen Inscense minimum Holofto Matthioli congener. The smallest Rush grasse, like the former Toad grasse. This little grasse groweth with fundry small thred like leaves, scarse an inch and a halfe long, with smaller on the stakes, which are about twise their length, at whose toppes stand two or three small heades like to those of Rushes, but with rounder graines or seedes therein, and closer set together; the roote is very small and threddy.

The Place and Time,

All these graftes are sufficiently declared in what manner of places they grow, flourishing in the summertime, ashe rest due.

The Names.

The first, second, fifth, and eight, are of Banbiums mention. The third of Tabermontanus and Lobel, and so is also the fixt and seventh, the rest have not been exhibited by any before.

The Versies.

There can as little be faid of these Grasses being hard and saplesse, that no eartle will seede thereon as of others welke, nor having an them any medicinable quality for man.

CHAP. XXXVIII.

Gramen Innceum lanatum five Bombycinum, vel Iuncus Bembycinus. Cotton Graffes or Rushes.

Have foure or five orts of these woolly or Cotton Grasses to shew you in this Chapter, which although they grow not all in wet grounds, yet resembling one another so neerely, I did not thinke it good to separate them, but set them altogether.

The ordinary Cotton Graffe hath a few long flender leaves, almost like Rushes rising from a small whof threat thrusting do was somewhat deepe into the moorish ground, wherein it usually groweth, and among the hard flender stakes, about a foote high, sometimes with a least or two thereon, and sometimes without either this of joynt, bearing at their toppes a sine fost woolly or rather white filkehike head, siner then the sinest white woll that is, of the bignesse usually of a Wallaut, with the outer haske, which is so eminent in ones eye a same of that is giveth much delight and admiration to the beholders, which passet have winto the winde being full ripe, where see it hash is not observed.

This Cotton Graffe heth many more and narrower Ruth like leaves growing from the roote, then the formulation of high as it, and the fine Cottony head is smaller, and not so pure white: the rootes at much alike

Although this hath many more Ruftly leaves then any of the former, yet doe not the fialkes rife much higher, por bare they at their toppes to great a tuft or Cotrony head, but are finall and toppewhat long, flying away with the winde being ripe, but leaving a finall head like a Crowfoote head of feeds behind at the roots is formewhat lake, and not much unlike the former.

4. Gramen tomento sum Alpinum minus. Small mountaine Cotton graffe.

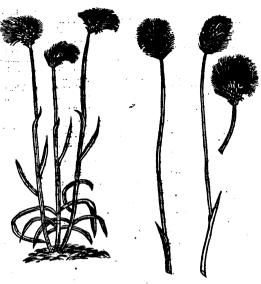

From a small unprofitable roote riseth a finall stalke halfe a foote high, with two or three leaves thereon, at the toppe whereof standeth a small round head of Cotton.

5. Iuncus Alpinus Bombgeinus. Mountaine Cotton Rufh.

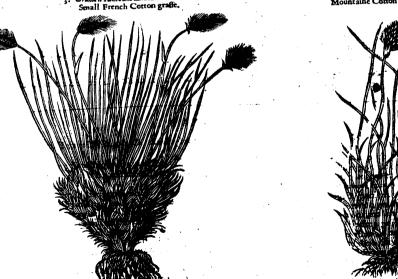

This also lendeth forth from a Rush like roote, divers Rushes, and among them sundry 11 nder ftalkes an handbreadth high, bearing a small white head of wooll or cotton like the reft

The Place and Time. The full groweth in many places of this Kingdome, and on Hampestead heath neere London, about a bogge there, the fecond at Elfinore, in great abundance, and in Germany allo, the third about Mompelier, the fourth in some moist places of the Alpes, the last in Moravia and flourish chiefly in Inly.

The Names. The first is divertly called by divers Authours, according as their knowledge and opinion thereof led them, for Tragus tooke it to be the Graphallium of Diofeorides, Anguis Lira his Typha, Geffier and others Linum pratenfe the Germane name being Matten flachs, Lobel Iuncus Bombycinus, Dodonaus Gramen Eriopherum, Thalini Gramen Innceum lanigerum, Tahermonsauns, Gramen tomentosum & Linagrostin. The second is the Inneus Alpinus capitule lanuginofe of Banhinus, although 3. Gramen Iunceum lanatum minus. 1,2. Gramen Innesides ianat am fit e Inness Bombyeines.
unit aris & alter Dancar. Common Feather or
Cotton graffe, And another of Denmarke.

5. Tuncus Alpinus bembycinus. Mountaine Cotton Rufh.

the figure exhibited was taken after the manner of the Danish growth the fourth was sent by the title it beareth, The last is entituled as Baubinus giveth it.

The Vertues. Cordus onely faith of the first, that the decoction thereof in wine, and taken warme, exfeth the griping painer in the belly. The woolly heads are gathereth by divers, to ferve both to fluffe beds and sufhions, and the like, which for the toftheffe and goodnesse farre excelleth any Thikle downe.

CHAP. XXXIX.

Gramen Arundinaceum paluftre. Marsh Reede Grasse.

Have shewed you in the last Classis before this, those forts of Reede grasses, that usually grow on the upper groundes, although fometimes in the lower alio. In this I shall entreat of such as grow in warery or marshy places. 1. Gramen Anundinaceum maximum Bayonense, Great Marsh Reede graffe of Bayon.

This great Reedegraffe (hooteth forth great thicke and very tall stalkes, as high as any man, joynted up to the tops, with long & fomewhat broad hard rough and straked leaves fet thereon, but lesse then those below, towards the toppes of the stalks, with the leaves come forth many sparsed tusts of chaffie heads, fanding on small long footestalkes, the whole pannickle being a foote long and more: the roote creepeth farre shout in the watery ditches and places neere St. Ishn de Luce, where it groweth.

2. Gramm Arandinaceum acerofa glama nostras. Our great Reed grasse with chassie heads.

This fort of Reedegrasse hath many faire large Reedelike leaves, springing from a joynted reddish roote, and are not much unlike to those of Miller grasse, but harder rougher, and straked all the length of them, having great Reddikestalkes three cabits high, joynted also and branched, and towardes the toppes bearing large; and somewhathard pannickles of spiked chaffic heads each of them about a spanne long, of a whitish colour in some plamand reddish in others, wherein lye small feede.

3. Gramen Arundinaceum fericea molliore fica. A leffer foft headed Reede graffe. This other Reede graffe is fomewhat like the laft, but leffer, with narrower and shorter leaves, and lower falkes, with but few joynts and leaves on them, the tufted heads that fland at the toppes, are fomewhat like to the Rash that is called bastard Schananthum, and turne into downe that is carryed away with the winde: the roots are fundry long ftrings, fet together at a head.

The Place and Time. The place of the first hath been expressed in the description, the two other grow in the low moist grounds by Bucliffe necre London, and flourish in the Summer time. .. The Names.

kananipposis in Greeke, and so also Calamogrottis & Gramen Arundinaceum in Latine, are as fiely applyed to the forts as the former, all these being of later invention, none having published any of them before.

1. Gramen Arundinaceum maximum Bayoneufe. Great Marih Reede graffe of Bayon,

2. Grames Arund naceum accross gluma nostras.
Great Reede gratie with chaffy beads.

The Vertues.

We have not yet heard or learned of any good property they have for medecine.

CHAP. XL.

Gramen aquatica, Water Graffes.

Here are some other forts of Grasses that properly grow in the Waters, and not spoken of tester, after whom shall follow the Sea Grasses that they may other in the rest of the Sea plants, as Grasses water Grasses.

I. Grammagnations wajar. Great water Grasses. This great Water Grasse hath great and tall stalkes full of joynts, with large Reede-like leaves at them striped with white and greene, like Ladies saces, but not of evidently to be seene up to the toppe almost, where standeth a large and long tufted pannickle of many parts and branches, like the or immon Reede, the tootes runne and spread farre shooting up in fundry places.

2. Gramma arundinacesum aquaticum. Great Water Reedegrasses.

The stalkes of this are great and high, having broader and longer leaves then the former, and somewhat harder the impose also be tween, and the tufted pannickle is more affected and soft in bandling, and of a running.

also, the sounts also be fewer, and the tufted pannickle is more spread and foft in bandling, and of a purplify

also, the joynts also be fewer, and the tusted pannickle is more apread and sort in paneling, and of a pupish greene colour, whose bloomings are white, the rootes creepe not so much as the former.

3. Gramen a quaticum panicula spetiosa. The faire headed water Graffe.

This Grasse risk to be two cubits high, the leaves are broad and a foote long, but stended by set on the stalkes, some what rough on the edges, some whereof will be hollow like a truther that the stalke will goe through it halle way, the toppe pannickle is made of rawly state soft staly tusts very beautiful.

4. Gramen agranicum paniculatum minus. Small bearded Water Graffe.

This Grasse sequences apparicum paniculatum contents.

compassed with fundry broad rough pale greene leaves, heere a foote long, the toppe pannickle is a spannelong, thinnely or sparsedly placed, made of many whitish heads, compassed with long sushes or beardes. 5. Gramen Echinatum aquaticum majun. The greater prickly headed water Graffe.

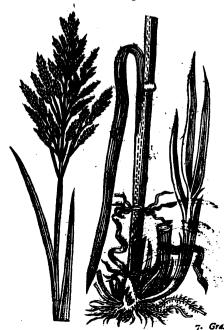

The stalke of this Grasse riseth up two or three spannes above the water, in the ditches where it growth with divers long and narrow leaves, bearing at the toppes of the Ralkes, divers small prickely bears with long leaves at them, the rootes thrult deepe in the mudde.

6 Gramen echinatum aquaticum minu. The leffer prickely headed water Graffe. This other Graffe is like to the last both in the leaves and prickely heads but smaller, and have no leaves standing with them as the former hath.

> 1. Gramen aquat cum mafue. Great Water Reede.

2. Gramen Arundinaceum aquaticum. Great Water Reede graile.

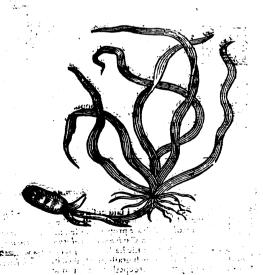

9 Gramen aquaticum aligrum. An other Water Graffe.

8. Gramen flaviarile. Floate Graffe.

11. Gramen bull'o um aquaticum. The Water bulbed Grafte.

7. Gramen aquaticum spicatum. Spiked Water Graffe.
The Water spiked Graffe hath sundry weake stalkes, leaning every way, sull of joynts which are somewhat The Water ipiked Grane natural undry weare training long and narrow leaves upon them, which lye floknobby or round, taking roote agains in divers proceeding upon and along flender the Water, that part that groweth up hath fome leaves like wife thereon, and a long flender browne spiked head at the toppe, the roote busheth thicke in the mudde with many strings and fibres thereat.

The Flote graffe groweth in the very like manner to the last, with leaning stalkes, and rooting at the joynes, but hath more store of leaves on them, the toppes being furnished with sandry spiked heads, two or three together ar a joynt upwards.

9. Gramen aquaticum alterum. Another Water or Burre Graffe.

9. Gramen aquaticum aiserum. Another water or dutte Grane.

The leaves of this Graffe are long smooth and tender, among which resetup a stalke about halfe a yard high, with a few leaves set thereon, and at the toppe a many small rough heads like burres.

10. Gramen Flaviatile cornutum. Horned Flote grasse.

This strange Grasse hath a very slender stalke about two foote high, joynted at sundry places, and two small Russy leaves for the most part set at each of them, growing somewhat broad, and compassing it at the bottome with a large skinne, from whence also rife one or two stalkes ending in a skinny head, which hath at the end of them three or foure very marrow leaves, turning downewards, and feeming like hornes: the roote is fmall and threddy.

II. Gramen bulbosum aquaticum. The Water bulbed Graffe.

This Graffe hath an ovall bulbed roote sported with yellow markes, and white within, not having any sent or talle, from whence springeth up betweene two eares as it were, a small stalke about two inches long, with ano ther longer peece thereon, at the toppe whereof thrusteth forth divers fibres, and from them divers long and broad leaves: but what stalke or flower it bore, we are yet to learne, being thus much onely brought and thereby

The Place and Time.

The two first doe g ow in ponds and lakes, in sunds places, as well of this Land as of others: The third in the watery places about Pados and in Hassis also. The fourth in the waters about Michelfield by Bassis. The fifth fixth feventh, eighth and ninth, in watery ditches and ponds in divers parts of the land. The last in the lakes neere Mompelier, and doe all flowr. Ih in the Summer time.

The Names

The first is the Gramen aquaticum harundinaceum paniculatum of Tabermontanus. The second the Gramen majus aquat cum of Lobel. The third and fourth are called by Banbings Gramen palufire, &c. but I have fet them both under the rirle of aquaticum. The fifth and fixth are not mentioned by any before. The feventh is focalled by Lobel as it is in the title. The next hee calleth Gramen angui innatans. The minth is called by Lobel Gramen aquaticum alterum. The last is so called by Baubinus as it is in the title.

The Vertnes. Most of these Grasses will Horses eate of, although we know not any use they have for any humanegriese.

CHAP. XLI.

Lythoxylon five lignom lapideum, Stone Wood,

Lythoxylon five lignum Lapideum. Stone wood or Wood made Stone.

E T me yet addethis Wood made Scone, in the end of these tresh Water plants, seeing diverse waters of these fresh water plants, being diverse waters in this Kingdome as well as others have that property, that what wood foever greater or leffer, wrought or unwrought, by letting it abide in the water, in the Sommer time or Spring, for some

time, according as tre thicknesse will give time to penetrate ir, the branches of trees and greene herbes, yea leather gloves, and many other have beene metamorpholed into stone, keeping that forme it held before it was put in, by the chilling quality of the water.

CHAP. XLII.

Gramina maritima. Sea Graffes.

Te Sea Graffes as I faid before are fittelt to be joyned next unto the former Water Graffes, that after

these I may show you the relt of the plants that grow in or neere the Sea, or within the aire or bream thereof, which are properly called Maritime plants.

1. Gramen Caninum geniculatum maritimum fpicatum. Sea spiked Dogs graffe or Quich graffe.

This Sea Graffe hath divers joynted stalkes about a foote high, with bard leaves thereon, a spane long, and like the other quich graffe, the fpiked heads are (horter by much and harder then the common kinde : the roote is full of joynts and creepeth under ground like it. 2. Gramen

1. Gromen Caninum geniculatum mariti with spicatum, Sea spiked Dogs graffeor Quich graffe.

TEIBE IA.

Canimum maritimum (pressum Monfpelienfe. Sea fpike grafie ot Mempeter

3 Gramen Canimum marithnum alterum longius radicatum. Sea Dogs graffe with longer rootes.

5. Gram:n Caninum maritimum afperum. Rough Sea Graffe.

2. Gramen maritimum vulgato Canario simile. Sea Quich graffe.

2. Gramen maritimum uniquie conner processing quich graffe, and of a more This other Sea graffe is a flenderer, harder, and lancker Graffe then the ordinary quich graffe, and of a more than the continuous control of the control of This other Sea grafte is a stenderer, naruer, and more stenders were two other differing forts bereof oble.

But there are two other differing forts bereof oble. blewish greene colour, and different not in any tuning ener. But there are the like finite increased between the order to be the like finites, kever, and the order to be the first finites, kever, and ved, the one in the rootes, which at the reversit joynes as it runners, better of those tufts of stalkes and spiked tufts, and will be sometimes twenty some in length, with a number of those tufts of stalkes and leaves at them: the other in the spikes, which will have two rowes or orders in them.

the other in the ipikes, which will nave two lowes or ordere in them.

3. Gramen Caninum alterum marisimum longing radicatum. Sea Dogs graffe with long rootes.

This long rooted Sea Graffe differeth little from the former, either in the hard leaves or in the running roote; This long rooted Sea Graffe different intre from the routiler, entire in the transfer and inflead of fpiked heads at the toppes of the stalkes, this bark chassic heads among

4. Gramen Caninum maritimum spicatum Menspeliense. Sca Spiked Dogs graffe of Mompelier.

4. Gramen Caninum maritimum spitatum Monspeliense. Sea Ipiked Dogs gratte of Monspelier.

This French Sea grasse hath stender wooddy rootes, with but sew sibres set thereat, from whence rise divers trailing stakes a foote or more high with sundry joynts and branches at them, and short narrow redelike leaves on them, at the toppes whereof grow spiked heads of three inches long apebee, of a darkash ash colour.

5. Gramen Caninum maritimum asperum. Rough Sea grasse.

The roote of this grasse is a bush of long white sibres, from whence spring many reddish round small stakes, which at the first leane downewards, about a foote high, compassed with hard flort and sharpe pointed leaves, standing as it were in a tust together, with hard rough dents about the edges: the spiked heads are somewhat like unto small rough hard burres, breaking out of a skinne wherein they were first enclosed.

6. Gramen existe vicinorum maris aggerum. A small graffe of the Sea downers.

This small Sea grasse shootesth forth divers short stalkes of two inches long, full of small long leaves like hairer, fet close together, and among them at the toppes small heads, like the catking of the dwarfe Willow, the toote is imall and threddy.

7. Oxyagroftis maritima Dalechampiy. Sharpe pointed Sea graffe. The buffry stalkes hereof are about two foote long, full of joynts, with two long and narrow grasselike leaves a every one of them, of a darke greene colour, and fo tharpe at the points that they are ready to percetheir legges that passe by it unawares.

8. Gramen Inncoides maritimum. Sea Rush graffe. The Sea Rush grasse hath from a blackish browne single roote, pleasant in taste and full of hairy sibres, sundry fhort stalkes about a foote long with slender limber Rush like leaves thereon, twise as long as the stalkes, and at the toppes three or four cleaves a spanne long, encompassing a rough head like a Rush which is full of diaffic feedes.

7. Ovyagroftis maritima Dalechampij. Sharpe pointed Sea grafie.

9. Gramen marinum fpicatum. Spiked Sea graffe.

9. Gramen

TR 1BE 14.

10. Gramen marinum picatum alterum Anotherfort of spiked Sea graffe.

9. Gramen marinum spicatum. Spiked Sea Graffe.
The roote of this Graffe is composed of a bush of many long fings or fibres, from whence rife many long hollowed or guttery leaves, compalling one another at the bottome, a-mong whom spring two or three stalkes bare of leaves unto the toppes where they beare long spiked heads of greenish

flowers for close together,

10. Gramen marians spicatum alterum.

Another fort of spiked Sea, Grante.

The leaves bereif are desider long partow hard, and sharpe pointed growing aften on the low places are the Sea, that

foretimes walketh over in which howards will care willingly, it beareth foredry low stalks with small long and round heads thereon.

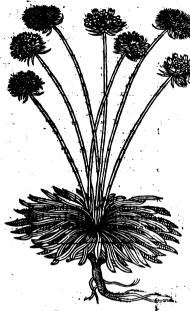

heads the recon.

11. Gramon marining mediterrance, major Statice quiting dem.

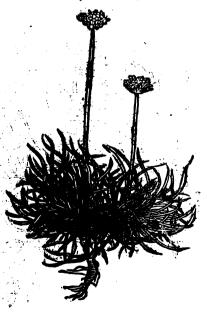

Although I have its my former Booke described and pictured both the forts of Thrift the greater finde. I will have just be reliefly remember them, and there you that the greater of them groweth with many faire flong and formewhit broad whitish greater leaves, lying the sogether upon the ground, from whom the flender it there is naked unto the booke, even in one alter experience. topes, except in one place toward the middle, where it hath two intal leaves, toward downews as contrary to almost all other herbes and at their cope a raft of blush coloured flow

in the leaves as the last tiset, but they are of a fadder greene colour, and somewhat shiring with two ribbes in each, and burn at the ends, the flerider stalkes bear sales such a tust of fowers, but they are white and breake ourse's skinne which fallen downe about the stalkes the roots is long and with but iew fibres thereat.

12. Gramen marinum minus The Small ordinary Thrift or Sea Cushion,

This other fataller fort is well knowne to have many finall hard short greene leaves thicke growing together.

TRIBE 14

and spreading on the ground, the stalkes are many of a spanne high, without any leaves on them, but at the tone a small round tuft of blush coloured flowers.

The Place and Time.

The three first forts, the fixt and the last, have beene observed on our Sea coasts, especially in Kent, the fourth and the eighth, about Mompelier and Narbone, and the fifth both on the Venetian, Ancompane and French shoares, also about Monpelier, the eleventh as well on the hils, as neere the Sea, and hath beene often sent us from Ports. gall, the reft are found necre the Sea coasts in many places, and are in flower and feede in the end of Summer The Names.

The first and third forts are mentioned by Lobel, the second fixth and eight have not beene remembred by any other Author before, the fourth and fifth are mentioned by Banbinus, by the names of Gramen Caninum maritis mum spicatum, and Gramen Caninum maritimum asperum, the seventh is so called by Lugdanensis as it is in the title. mum spicarum, and Gramem Caninum maritimum asperum, the seventh is so called by Lugdunensis as it is in the title, the ninth and tenth are mentioned by Lobe. The eleventh Clusium sirft called gramen marinum majum, and so do the ninth and tenth are mentioned by Lobe. The eleventh Clusium sirft called Gramen marinum majum, and so do the Tabermontanum also at a title of Plants, he calleth at American marinum majum, and so do do the body where so ever and so by Camerarium also, but different from the Scatice of Pliny, and as divers from the Camerarica although Camerarium taketh it to be the Cantabrica of Assasses of Pliny, and as divers from the Scatice although Camerarium taketh it to be the Cantabrica of Assasses of the control of the second s The Vertues.

The Vertues.

It is generally held that the rootes of the Sea Quich graffe is as efficiently the ordinary of common fort, and therefore for the qualities, I must referre you to be enformed there where I speake of it, that to I may avoide a double repetition of the fame things, the rest are not put to any use in Physicke that I know. This difference between these and those of the Land hath beene observed that cartle will not feede on the leaves of these by reason of their hardnesse, roughnesse, and sharpenesse, when as they refuse not the other.

CHAP. XLIII.

Alsine marina. Sea Chickweede.

Here are some sorts of Chickweede that are reserved out of the samily of the former Chickeweedes to be entreated of in this place.

I. Alfine minima. Sea Chickweede. Alfane moritima Neapolitana & Coronopus tennifolius Neapolitaumunit, Bluth Chickword of Naples, and finali Sea Buckes horne of Naples.

I. Alfine marina. Sea Chickweede.

This Sea Chickweede groweth for the most part with the branches lying on the ground, very like unto the gidle fort of Chickweede, but that the stalkes are shorter and thicker, and closer joynted with such like leaves side for of Chick weeds, but that the transes are morter and thicker, and cloter joynted with fuch like leaves shem, yet thicker and whiter, the flowers are composed of many small leaves standing like a starte; the seeds standing like a starte; but flat and somewhat broad, wherein are contained sero some greater seeds; the roote is thready. Another like hereunto is that Sea Chick weeds that Clustus in the sound with thicke leaves, like into Purslane, growing on the land hills never the shore in Holland, but the starte when the starte started in Holland, but buthe flowers as he faith were greenifh.

the flowers as he faith were greentile.

The flakes of this Chickweede are exceeding final, lying on the ground, round about the rootes, with as fine admill leaves almost thereon, two alwayes of more fet croffedwile at the joynes, being of a fingers length almost the flowers stand at the toppes, as in the former Sea Chickweede, but of a blush of pale purple colour, whole teeds is contained in the like long heads as others the roote is threadly as the rest. With the figure hereof where in the same table that small Sea Buckes horneof Naples ser forth by Columna, the description whereof you shall finde before in pag 501. and might very well have been brought hither, among these other Sea plants.

The Place and Time.

The titles of these declare their places of preeding and their time is with the others.

The Names.

The full is called Alfine marina of Dodoness and Tabermontanus, but Lobel calleth it Alfine five Hippia major. and Coldina Gentunculus, the other kinds whereof Cluffus calleth Alfiner genus pelagicum. The second is called by Column, Alfine maritima Neapolitana, The Vertues.

There is little use made of these Chickweedes in Physicke, and yet their talte as well as their forme, declare hanof the fame temperature with the other forts.

CHAP. XLIV.

Lenticula marina vulgaru. Ordinary Sea Lentils.

ness Aturall to the Tyrrhene and Adriaticke Sea, betweene the Florentine and Tenetian Dominions, there groweth, faith Lobel, this plant, which hath the long and narrow leaves of Scoparia a Broome Fiax, very thicke fet on weak bending stalks, life a foote long and full of empty round skinny berries, Enuno Lentils, from whence it came to be fo called. Thre is another fort hereof called Lenticula marina (ermust find very like it differing onely in that it hath broad and florter leaves, denied about the edges.

The Place, Time, Names and Vertues.
Their Place is declared, and Time to be understood the Somer Lobel callethic Limiteulassarina Berapionis and book Tabermentania and Langdomenfis after him, who Molath it is called by fome Vva marina. Baubinus calwhither with plaine leaves Fucus folliculaceus Linaria file, and faith that Imperatus called it Acinarie marine emspecies, but the other with jagged leaves, he calleth hen felmens forrate felio, and of Imperatin Acinarie mametentia frecies, but to what use it may serve in Phythe buth not yet beene observed. Clusius in his Scholia uthelast Chapter of Acosta his Booke of simples putwhitto the question whether that with dented leaves, bould not be that herbe that is called Sarguafo, but Banwinhis Pinax fetreth it downe as if it were certaine. Theehave been often feen covering the Sea, in fayling to the Est Indies, betweene eighteene and thirty foure de-mos Northerly Latinide, which by hindering the hip passage, some of the Saylers in cleering the sides of tethip, brought it into the thip, and while it was fresh ideae thereof both raw and boyled, but grew hard and binde when it was dry, and was of a clenting property formine, as one of the Saylers troubled with foulchin-

moun and the stopping of those passage, found to his ease that did eate thereof. Acofta his description thereof is addismanner. This plant groweth in a large smooth Sea covered therewith, as farre as the eye could discerne, Whose bottome could not be reached unto by our plumme line, yet very likely to rise from the bottome, as might be differented by the berries wrapped together thereon on the branches, and being pulled up was of an hands last with leaves halfe an inch long, dented about the edges, and of a reddifficulty, without talte but what it from the Sea water? at every leafe it borea berry like a Pepper corne, but hollow full of falt water, and of a white colour, or mixt of white and red : being fresh and new taken up it is tender, but brittle and hard when it is dryed.

Lenticula marina vulgaris & ferratio folifs. Ordinary Sea Lentils.

CHAT:

CHAP. XLY.

1. Parthenium marinam. See May weed or Featherfew.

The roote hereof is blackiff foreading into many long into many long interaction in the ordinary weake fathers in the ground, for on both long in the roote is long and flender, and fleoretti forth divers fibres from it.

The roote hereof is blackiff foreading into many long fibres, feeding forth fender, weake fathes typing on the ground, for on both long with larger leaves then are in the ordinary May weede having a large white flower, and a yellow thrum in the middle.

The Place and Time.

The first groweth neere the Fishers Cottages at the foote of the hill Cestime in Narbone in France, the other in the saidy grounds neere the Sea shore, and flower in Summer.

Lobel calleth the first Cotula five Parthenime martaum minimum, Lugdunensis Parthenium marinum minimum. Banbinun Matricaria maritima, and thinketh that it is the Chamemelum maritimum Dalechampy, let downe in the second plact and called Cotula marina by Lobel.

The Vertues. The first hath neither weaker, faith Lobel) nor differing properties from the ordinary May weede, which for to avoid a double repetition of one thing. I referre you to the Chapter of Maywoode in the first Classis of this Worke. Of the other there is no particular property recorded.

CHAP. XLVI.

Conyenmarina. See Flenbane.

His kind of Conyus, that growing in the fields meere the Sea Coaffy, both a long dry hard room, and from these rifeth a round stalke, about a foote high, bran-ched into fundry parts, let with long and narrow leaves somewhat like unto

the finaller Ribbewort Plantane, almost without tafte yet a little bitter: the flowers are yellow, standing in a close ruft together, and are blowne away with the wind when the head is ripe.

The Place and Time.

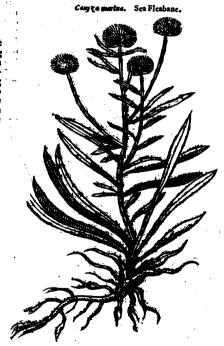

The place is declared before, and the Sommer in the time of its flowring.

The Names.

Lugdunenfis calleth it Cony za marine, and Banbine as Itaid in the fix and twentieth Chapter of the fixt Classis here before, would referre it to the Chambille altera Dioferridis Rainvolfio, which I there faid, I thinke to be erronious for the reasons there alledged.

The Vertues

It is thought to have the fame properties that the other Fleabanes have.

CHAP. XLVII.

Glaux marisima. Sea Milkewort.

Vr moderne Authours have mentioned divers forts of Glams, whereof that of Clusius and another called Vulgarin, have beene formerly handled before in this Woike. Dodoneus, Lobel and others, have exhibited one that I meane to entreate of in this Chapter, which is the leffer, Cordus and Camerarius; a greater, and Alpinus one differing from them both each supposing theirs to be the neerest unto Diofcorides his Glaux.

i. Glaux maritima major. The greater Sea Milkewoft.

Thegreater of these Milkeworts bath fundry stender weake stalkes spread on the ground, beset with divers Integretate on the ground, beier with divers like leaves, yet a little larger, and of a grayish greene colour on the upper side, and more grayish undergoth, the flowers are purple set at the joynes with the leaves, after which come small buttons with seede in them the roote shooteth downeright, but the branches as they spread take roote againe. Baubinus saith there is forevariety observed herein: the greater fort having sometimes much larger leaves, and sometimes narrower. be the fort having the stalks thicker stored with leaves, especially upwards, the lower being false away leaving the lefter fort traving the travel for the state of the s

Helesser fort differeth little from the former, in the manner of growing, but in the smallnesse both of stalkes adjuves and that this is found growing in places neere the Sea or falt Lakes, and the other as well on the hils. acas secre the Sea. 3. Glanz marisima Feneta Alpine. The Venetian Sea Milkewort of Alpinus.

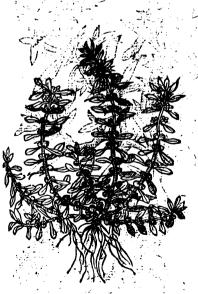

This Venetian Sea Milkewort rifeth up from a flender long wooddy branched roote, with foure or five flender Alless cubit or more high, fet at equall distances with fundry formewhat long and narrow leaves, greene on the upper file, and hoary white underneath, and at the toppes force of five flowers flanding together, as it were in an abellior forme and bigneffe, being very like unto the baftard Scorpion like podded Sena of Candy, but of a whimblath colour, and are succeeded by small short round p de, having small hard round seede within them, tafing a little (weetifh.

The Place and Time.

The first groweth in many places of German, and was sent as Bashinin faith, to him from out of Stotland, but thelethis often found, both on the Kentif and Effex thores, and the last as Alpinm faith in the falt marthes neere mo Cledid, a City of the Venetians, flowring and feeding in the end of Summer.

2. Glaux exigue maritima. Small Sea Milkewort.

3. Glaux maritima Veneta Aloino. The Kenetum S. a Milkewort of Alpinns.

The Names.

The Greeke name yout is taken from parage or your, which is milke, and the Latines follow the Greeke name Glanx. and not as some thinke a glanco colore, for the Latine derivation cannot suite with the Greeke word. Plan Glaux, and not as some thinke a glauco colore, for the Latine derivation cannot tuite with the Greeke word. Play saith it is called also yakarre, because it restores the decayed milke in Nourses breasts. Cordus on Disserties, and Camerarius in horto, mention the first, which. Baubissus calleth Glaux latiore folio Thompsica. The second Dodgness, Lobel, Camerarius Tabermontanus and Lingdonessis; speake of and call it Glaux exigus maritims. The last is mentioned by Alpinus in his Booke of Exosieke plants, by the mane of Glaux in maritims, but Baubiss would referre it to Clusius his Dorzebnio congener, as it they were both one plant, and of the Family of the Trabolics, as Lotus, yet furely how foever they be in fome things alike, they are most likely to bee different plants, and therefore I have placed it here, being of Alpina his judgement, that it doth come as neerely if not more, unto Dioscorides his Glanx then any others.

Ir was nied to be eaten after it was boiled as a Sallet herbe, with oyle and falt, in generall by all, but in especiali by Nourses that wanted milke in their brelts, to helpe to encrease it, for which purpose also it is used now a

CHAP. XLV III.

Kali. Glasse wort.

Aving by I know not what chance left out fome forts of Kali from the other formerly exhibited.

Aving by I know not what chance lelt our tome forts or a set from the enter formerly embited, let me place them here among the Sea plants, tather then leave them cuit altogether,

a. Kali problem. Prickly Glaffe wort.

This fort of Kali or Glaffewort rickly by with one hard flalke, three or four foote long tometimes branched from the very bottome, each of them three foote long for the most part, whereon are fet narrow leaves, without order, in some places but one as a joynt, at others two or three, flanding opposite all along, and others two or three together, some longer then others, the longest being usually about

two inches long, at feverall joynts with the leaves. both on the falk & branches come forth certain hard hoskes, pointed out into fixe sharpe prickely ends, formed somewhat like a Starre, with a small white slower in the middle, which abideth not long, that middle parcasterwards swelling somewhat higher, hath a finall pricke thereat, in which head lyeth one feede, almost like a graine of Wheate: the roote is spread into some branches, and perisheth or witherethat the first approach of Winter with us, although it will abide in the forme as it grew a great while after it is withered and dry,

2. Kali floridum repens Neapolitanum Columna. Columna his Neapolitan Glasse wort.

This small creeping or foreding Glass wort, shooteth forth fundry weake branches lying for the inoteth forth fundry weake branches, lying for the most part upon the ground, and railing it selfe up but a little, parted likewise into branches, set consusted ly with small, thicke, round leaves, at the toppes of the several branches whereast; fund, many small white flowers clustering together, made of five or fixe small pointed leaves a peech, see: when the ceede small heads opening too by sure, each sing pointed at the ends, containing whom much very small brownish seeds, the force of complete of many small long strings and stress to the in: the whole plant is very salt, and covered with a rough meditines, a smany Sea plants are, which althought in its naturall place of in the whole plant is very salt, and covered with a rough meditines, a war and salt in the whole plant is reasonable in Gardens, yet will a hor do to it and country.

The longest leased R winer is lassed by the superior of Egypt.

This Kall, that as Algoria hairh is more proper to Fgypt then to any other paner. The bounding state with the superior of the

Kali lengifinil fills Egyptium. ng leafed Kaltor Glassewort of Egypt.

Kali Arabum primum genus Rauwolfis. Rauwolfiu, bis first Arabian Kale.

k is a small plant (faith he) full of liender pransing genus. Ranvolfio. Ranvolfion his first a rebian Kali.

It is a small plant (faith he) full of liender pransition very orderly fet or placed together, sending forth many small harded joy nes disperfedly thereon, and are fundry small narrow needer and pointed leaves, being of an asholour on the upperfide and whitish underneath, as the stalkes and whole plant is also.

The Plant and Time.

The two former fores grow neere the sea side, the former both in France and Italy, the other Columna sirst found on the Westerne shore of Naples, and slower and seede late in the yeare, the third Alpinus saith is most proper to

Egnt, and the last to Spris.

The Rames.

The fift of these hath been taken for Tragum Matchiels, but his is alwayer found growing lower and smaller, and without leaves, and this never without, whereby it appeareth plainely that they are two severall plants, and sodoth Autonie Mount of Venice account them.

Bankings in making two forts of Tragum, calleth one Kali

1. Rali / pino/um. Prickly Glaffewort.

. 4 Kali

hixofum cochleatum, but why cochleatum, I fee no cause, for it is not Label his Kali cochleate semine, for that hee made the first of his Kalies in the foregoing Paragraph, and I thinkethere is no other Kali cochleare semine te made the first of the Katter in the foregoing ratagrapu, and a time regard of Masshiolm, as all Authours fince him have called it, and faith withall that because Dissertides, gave no leaves to his Tragum, therefore Maribidiu and have called it, and faith withall that because Dispersors, gave no seaves to some regress, westerne against and Tabermontanus, did expresse their Tragmo without leaves; but Lobel fee leaves, to his Tragmo, as he himselfe faith Tabermontanus, did expresse their 2 ragmm weasons i saves as I faid before, faith he found that fort also without found it on the Venetians Island called Lio: but Donaton as I faid before, faith he found that fort also without he found it on the Venetians Mand cauca Law: Dur Longian as a same beauty, interior bound that for allo without leaves in the fame Mand. The fecond Columns calleth Kali for discourage missing Mangolis Respoise mans, and Bashinus Kali Cressule minoris folio. The third is the third Kali of Alpisas in his Booke of Egyptian plants. The last is called by Raunossian Kali Arabum primum genus, which as he faith is called Usen by the Arabians, but by the Natives where it groweth Schinan_

The Vertness The after of all these forts, as well as of the former forts are both used to make Sope and Glasse, and to purge the belly also, from a doll cholier as Alpina fight, especially of his fort, either the juice of the leaves or the pouther of them taken in Wine.

mariani. Sampirë.

N this Chapter I must joyne, for the name and places sake, three or source other plants, because I would not make many of them. 1. Crithman marinum vulgaris. Rocke Sampire.

The Rocke Sampire groweth up with a tender greene stalke, about halfe a yard or two foote high at the most, branching forth almost from the very bottome and stored with fundry thicke and almost round, somewhat long leaves of a deepe greene colour, sometimes three together, and

fometimes more on a stalke, and are sappy, and of a pleasant hot or spicy taste: at the soppes of the stalke and branches stand umbels of white flowers, and after them come large seeds bigger then Fennel, yet somewhat alike: the roote is great, white and long continuing many years, and is of a hot spicy talle likewise.

2. Crithman marinum majus. The greater Rocke Sampire.

This greater fort differeth little in forme from the precedent but in the largenetic, and in not being of fogood a rellish or spicy taste as it, but smelling some what strongly of Smallage, and tasting more bitter.

3. Crithman marisimum spinosum seve Passinaca marina. Sea Parsneppe.

This Sea Parineppe is very like the former Sampire, but it proweth greater and higher with shorter and nar-

1. Crithman marinan valgatim. Rocke Sampire.

3. Critimum marithum fringin free Pafinaça marin. The Sea Parfneppe,

iower leaves, much more divided, and marpely wicking at to the flatkes are more lappy and of a frequence close, the flatkes are more lappy and of a frequence close, breaking into three or fourth branches towards the oper where frand large united of white flowers, and afglong and white, fomewhat like unto a Parfneppe, but more divided into parts, and is of a good rellish stomewhat refembling a Parineppe.

4. Crithmum Chryfanthemum. Golden flowred Sanspire.

The Golden Sampire bath fundry hard round stakes, ri-ing from the roote; thickey fored with very marrow long and somewhat thicke leaves cut, in at the thickes are the the topes of the stalkes stand single flowers, like unto After or cylandemam, wholly yellow, both the border and the thumme in the middle, wherein lye the feede when they are ripe and are blowne away with the winde: the roote is divided into many strings. The Place and Time.

All these plants grow in or neere the Sea. The two first onthe Rockes that are often moissened at the least, if not ortiflowne with the Sea water, the other in grounds not fart from the shore : and doe all flower and seede in the fact from the inc. angust. The Names.

The Greekes reignor or reignor, or Galens x f thor, and the latines Crithmum, is generally not onely given to the two fillors here fet forth, but to the two latter forts alfo, of which errour Matthiolou is the first Authour as I take it. and from him all others have deduced the ritle : but Lobel' and Lugdunerffis first put in the doubt, and exposed another the char did more rightly as he faith, agree to Dioferi-chisdefription of Crisbaum then this, namely the Porules merine, for as he faith, this hath no relemblance with the (rishmam of Diofcorides, which he writeth hath whi4. Crisismam Copfantheman. Golden flowred Sampure.

trandbroader leaves then Purflane, and such faith he hath the Portulaca marina, but such hath not this Crithman havery greene, and nothing to large as Pursiane and may more fitly be called, even as the very common fort of prople doe Faniculum merinum, Sea Fennell, for to in the umbels and whole face thereof it doth all imilate a Fennell, tell: but if I may be so bold to scanne Doctor Lobel his Crithmum, I believe it will be found as defective infome other part as the former : for although Portulaea marina agreeth with Diofcorides his Crithmum in the leaves, yet ndoth not so in the seede, wherein it must also agree if it be the right: but the seed of Portulaca marina, is flat like in Arrech, and fasth not in it, a kornell like wheate, as Dioscorides description doth enforce it, and therefore we may conclude that neither this nor that doth answer Dioscorides his Text in all points: this is therefore more properly to be called Remiculum marinim, untill it can be better determined whereunto it may be appropriate: Some would also make it to be Busieren Dieferidis, but Matthieles hath diffolved those errors, shewing that this See Fennell bath no purging quality therein at all, and that it was nover feene naturally growing as well on hils, as rette the Sea lide. Cefalpium onely, and Banbinus from him maketh mention of the full Crithmum here, calling it Beicelle alternen genem ex Sivilia, as he doth the fecond Baticula quafi parva Batis, for it is thought to bee that which Pliny called Batu, as Gefner in horti doth, and Crithmum marinum alfo: It is the first Crithmum of Matthis w, whom almost all other Authours doe follow, who also faith the Italians his Countrymen called it berba de San Perre, and fome from thence Sampetre, and the French thereafter, San Pierre, and we from them, being our mer neighbours, Sampier. Baubinus calleth both these first sorts Crisbmum fine Faniculum marinum majus & minn. The third is the second Crithmum of Marshiolm, called Crithmum spinosum by Dodonem and Tabermontambut Passinaca marina by Lobel, Lugduner sis and others, and as Baubinu thinketh, is the Tribulus marinus quorules of Delectrospini alto. Auguillars sooks it to be Section; and Conservation callette it Cactery marianus. The latis Marchielus his chird fort of Orichantus whore Lagdanenss and Conservation doe follows: Dedoncus callette it Cretainin Chorfauthonium and Lobel Corfauthonis theoreum, Cafalpiante Anthylis prima Disformine, Cardis in ob-front files Ambyllis major and Bathains Crisbaums, martimum flore' Affords wattich, and by forme After Atticus majors. The Italians believes the fiscalor name callic Finochis marine, the Spaniords Perrenil de la mar & Hinois wing, the Prency Passell makes had gueste and Civerentaine as the Apothecaries in their shops beyond Sea Cre-Mmarine, this from them, or they from it: the Germanes Meerfenckell, the Dutch Zee Venckell, and We as I faid Sampier and Sea Fennell Provini Gefrentine calleth it Coertimine & Rincom marinam, The Vocas.

To flew you the Vertice of Dispositly his fightness, is but to put you to my whether they answer unto our samples within are these. The wooder and the leaves boy led in white and dranke helpeth the difficulty in making wathand the yellow hundleds the those and provide the woldens couries, his earen both new and boyled as continued the yellow hundleds the provide his life is fair and a lately better within whereby it his han eneffectually property to dry and to then he but yearents of these properties are weaker in far then it is in those things that are bitter. Our Sampier is a fafe herbe, very pleasant both to the taste and stomacke, not onely by the salenesse, but by the pleinesse in it il kewise in sielping of greating in some of the Civer and Spicene, Collination Continue of Litteral Collins

provoking urine and helping thereby to wash away the gravell and stone agendred in the kidneys of blader:

Many other Sea plants might have beene put into this Classis, which I have dispersedly handled and spokes of through this whole worke, because they were so like unto those plants, whereaseo I have joyned them, they could not well be separated. I thought them therefore fitter to be entreated of there, and reserved onely these few for this place.

CHAP. L.

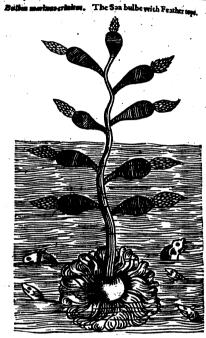

Bulbus Crinisus marinus. The Sea Bulbe with hairy buffa toppes.

Efore I come to the Sea Mosses, let me addethis uncouth unheard of, and peradventure untrie, of at least uncertaine Sea plant, in that we have not yet read or heard of any found Authour that had a provisioned in the Author that

mentioned it, but Lagdanénsis and he, as he faith out of certaine Navigations in the Italian tongue, but neither persons that faw it, nor place of the Sea where

it grew but onely among certaine Islands, nor time when it was found, are expressed in the declaration thereof; which maketh it the more suspicious; but as Lugdunenss him lesistedowne, so I will give it you to cause others to single part the truth, or folly of the matter. Among considerational data do the sound of the matter. Among considerations and the sound of the matter. Among considerations of the sound of great abundance of the single control of the sound of the

CHAP. LL.

Muscus marinus. Sea Mosse.

- 0

F Mosses I am next to speake, which are of many forts, some of the Vplands, and others of the Sei, it which must be joyned next to those other Sea planes, and those of the Land after them, and because it the season of divers forts, I thinke fit to distribute them into three rankes, the first to be of those it that are of an herby substance, the second of an harder stony, and the last of a spongy matter: the first fortallo is to be divided into these planes, that beare sine cut leaves, like Mosse or Fearne, and most the last of a spongy matter.

those that have broader leaves, of those with fine cut leaves I shall entreate in this Chapter, and of the broads in the next.

This foft Sea Moffe (is not Coralina, which is hard and hath a branched fialke, bur) is like unto those Moffe; that grow upon the ground or trees without any rootes, onely growing upon the rockes, or upon the shelp of sindry fishes, being a fost herbe composed wholly of woolly white haires, without any branch or staller, and is often found white then reddish or gray, but is not greene. There is another small forthereof, found growing on the stall of the st

ner found white then reddish or gray, but is not greene. There is another small forthereof, found growing on the stones by the Sea side, as allo sometimes upon wood, and is likewise sometimes cast up by the Sea on the same among the Alga of divers forts, growing somewhat like the former or ground Mosse, but that it is white and the stetch a little saltish and binding.

2. Museus mariums Neapelleanns. Sea Mosse of Naples.
This Sea Mosse likewise groweth unto some rocke or stone, rising with a stalke more then four inches high

Odufen me tuns capillacem Drojeeredis & alersyon Ventin. The tort Sea Mosse, and another finall fort from the Venetian flore.

3. Majtu warhut fen Atga tintloria. Dying red Sea Molle.

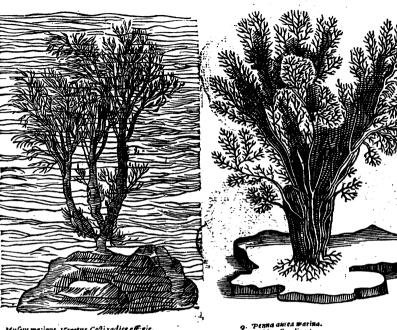

5. Od four warines Ferdinetas.
Long Fennell like Sea Muffe.

TRIBE 14.

6. Mulcus marinus Abrotonouics.

7. Mafeus marinus argenteus ; lamiformie The filver like Sea Feather.

8. Muleus marious Venetus Coftiradice eff eie. The long close Sea Mosse of Venice.

with fundry branches on both fides, and they against divided into leffer, all of them plentfully flored with gery high leaves, as small as Camomill leaves, or finer then they if any other the finer, for in handling at the first, casie to be bended, and transparent if they be interpoled to the light, greene below at the lower part, and purplish above: this is not so beging an Corolline when it is dryed, and groweth more rough by the drynesses the boye in may well be referred unto seem kinder there of and tenineth a very falt tofte within, but being put into water which with lessened therein, it will grow but being put into water of a while fleeped therein, it will grow

3. Muscus maritimus tinterine five Alga tintleria Inganenfis. Dying red Sea Mosse. This small red Sea Mosse is somewhat like the last, but with more fore of fort fealies and fewer branches, and with as fine small leaves on them like unto Fennell of a reddish co-tor, but with some whitenesse mixed together; this is need by divers to strike a deepe crimion, or reddish purple ion, but will laft long.

colour, which will laft long.

4. Mystain min hour viscous Finding landers. Short Fenniell like Sea Moffe.

This (host Fennell like Motie groweth up from blackiff round and flores reases, with divers fine thors leaves the Femali, of an herby or greene colour, among which an herby falls rifeth also with fach like leaves on it, and

the Femerica artery or greene cotour, among which an newly stalks riterianto with the like leaves on it, and niving findry fwoline eminences thereon.

1. Ottofor marriant Formlation. Long Pennett like Sea Mosse.

The leaves hereof are very long and fine like unto the Fernals, be Fernall glant, growing from stalkes neere a sore long divided into branches, this firmingent from Rockerot the like.

6. Masses marinus Abrosomoides. The Southernswood like Sea Mosse.

This also risets up from the Rocker with thicke stalker and branches, with fine car leaves on them, formewhat

This allo rises up from the Access with the set states and branches, with fine our leaves on them, fomewhat the onto Southernewood, but much bigger, and of a brownish red colour.

7. Maseu marinus argentess plishiftenia. The filver like Sea Feather.

This most beautifull Mossegneweth on the Rocker in the Sea, upon the dry shelp of Fishes, and is also often found wrapped amongst the wratte of Sea weeds, cast upon the firore, growing up as the figure sheweth, into many particular parts or branches, made as it were all of haires like other Mosses, but verily representing seasons. main particular parts of prancies; and east were and harce like other mones, our verily representing tevest firigs of Peathers, of so part a white filverlike colour, that he is to be wondered at, that any Sea Mossefield become so white by nature, or made by Art, the property whereast is to water the Spicene applyed with
viscies, it quickly also dissolvent the scrophales of kernels in the threats, or elsewhere: it helpesh the Dropth share t doch abindantly provoke urine: it clenteth likewise the relegant, and gravell or stone engended in
the kineyes, it a dramme of it in posterior be taken in the distilled water of Erspinson, thedge Mustard or Sea Holly
with an equall proportion of the juice of Lemmons.

8. Musica marisms Universe Cessis indictivation of the Venetian Costus like Mosse.

9. Musica marisms Universe Cessis indictivation of the venetian Costus like Mosse.

This Venetian Mossegroweth on pockes in the Sea, which by the often agitation of the water, is broken from it, and carryed to the shore, first lighting may repose, but being made as it were of a tust of small stickes for together and being dry refeatblesh the roote of Gostin Indian, but whiter, and being dry refeatblesh the roote of Gostin Indian, but whiter, and being modelened again, openeth it sales into the forme aforesaid, and a it is expected in the figure, it is very sale, and full of it like sand.

This Sea plant that for the beauty and exterdence thereof, desh worthly deferve his name, although sent thus

mined as it were, being but a peece aritis thely, of what it was when it grow, yet fuch as it is I here offer toyour view, being of a most fining gold colour, both talke and leaves, which very neately reiembleth the Sparten Anstrianin of Cinsus, which we call the Peacher grass.

The Place and Time. Their places are alf declared by their titles to be the stones on the shore, or Rockes in the Sea, and the shells of fiftes, &cc. whereon than of them broads, and but few fpring out of the ground as the fourth doth, fome in other Counciles, and fome on our owner cashs, and perith not in Winner or Summer. The Names.

The Greekes call it fei a Sandayin, and Museus marinus in Latine yet some promise uously call these Fucus marinus, as well as Museus, but Dioscorides distinguisheth between them entreating of them in two sundry Chapters, and although Pliny be inconstant herein, making Mosse sometimes an herbe, sometimes a shrubbe, and sometimes confounding both Mufew and Fuew together. The first of both forts is mentioned by Antonio Donati, in unes contounding both Angew and I went together. The first of posts forts is mentioned by Antonio Donati, in his herbation of the He of Lee of the Venetians, and is also the Major marinus of Diaforides, according to Confamine, his more exact consideration as Languages of other leaves, and the Farm capillace folio of Theophraftm, ait is thought. The second is Classian his Major marinus, which by reactived from Imperass of Naples, and sent by the name of Palmedamarina, but riothing agreeing with that of Theophraftm. The third is the Farm five Algainstoria of Languages. The fourth is the Major marinus vision, which Cafalpinus callets Major marinus subsects mollier. The first has Farm Fernlaces of Label. The first has Farm marinus folio abrotani manimals. by Donath's as their titles declare them, and the eighth is mentioned by Ponath his Italian Baldus. The Arabia at call the Sea Mosse Tambalab and Thaleb, the Italians Moscomurino, the Spaniards Malhoquiana yerva, the French Monffe de mer the Germene: Meermoff, the Dutch Zee mofch. The Vertues.

Most of these Sea Mosses doe binde much, and coole inflammations, and being applyed while they are fresh give michesse to those are troubled with the hot Gont, they have an especiall groperty in drying, thickning, & cooling, what part forwar flaudeth in neede of any of these qualities so both the forts of the first, killeth wormes in the bodyand the second of them is very effectuall for watering red eyes, if the pouther mixed with some Fennell Watrie put into them; the same possible raken with Vinegar stayeth vomiting, and skengthenach the stomacke,
but if the decosition themself in winable injected into the bladder by a foringe, it cleans the carnotity in the
take of the bladder and ulcore therein, prooved effectual to being one troubled with that disease in a shortthe: the eighth likewife is faid to helpe to cleanle fouleulcers of all forms sither inward or outward, being made into pouthet and given in wine and clenfeth the ftone in the kidneyes: the vertues of the feventh are declaed in the description.

CHAP. LII.

Fuens marinus five Alga marina. Sea wrake or Sea weede.

F this kinde of broader leafed Sea excreffences, that are foft and herby, fome more and fome leffe, there are many forth, sacking shall be here expressed.

T. Hicket sharings flow Alea marine gramines. Wrake or Seaweede, or Grasse.

The roundistrootes hereof are hairy, and blackish on she outside, from whence rise up small, and;

1292

round and long white hairy heads, breaking out at the fides as it were into branches, on the toppes whereas round and iong white hairy heads, breaking our at the lides as it were your manager we me coppes whereof fland three or four very long and narrow fost greene leaves, fome the janell or more long, and about suinch broad: this hath neither feede nor stalke, but lyeth on the ground untill the ride raise it on the water, which teng

broid: this hath neither feede nor stalke, but lyeth on the ground untill the tide raise it on the water, which teng broken by the force of the water, is carryed to the shore, where it is kept for many things.

This different from the former in that the roote is wholly sibrous, the slake rising from thence, thicke and round two or three inches high, and the lease which is sometimes but one, and seldome two of a very great length, byth divers feere or els long, and above four inches broad, equall, from a little above the setting on to the end, but some what waved or crumpled on the edges, being chicke and of a deepe greene, colour, so soft and most while it is fresh, that it is like unto most glue or gelly, and will bardly dry unless a little long in the Sunne, and will not be fit

fresh, that it is like unto moist glue or gelly, and will hardly dry unlesse it lie long in the Sunne, and will not test to be kept without rotting untils after many dayes drying.

3. Fucus maximus lass straights tenne folias. Broad and thin Sea girdle.

This is in all things like the last, but that the leaves are thinger broader and shorter, yet crumpled on the edge, and of a paler greene colour, and is like unto thin parchment.

4. Fucus astate type pologonoists. W inged Sea girdle.

This cleaveth unto stones, and shels of silkewise both in the desper and shallower places of the Sea, having a round darke reddish stalks of the bignesse of a Goose quill, which being growne to the full length lavery weake, lying on the ground, unlesse the water raise it, and as sell longs: on each side whereof groweth a wine, all the whole length of it, like unto a skinne, or parchment with veines therein, which being like the stabe of an arrow, is small below and broader above equally to the toppe, of two or three inches breadth; the leave that grow next the ground are many (and some are set also on the stalke) of a yellower greenish colour, and of an arrow, is finall below and broader above equally to the toppe, of two or three inches breadth; the leave that she had breadth, being source, its, or eight inches long, lither or of a skinny substance like unto the other girdes like she shalke doth very well resemble a two edged sword: and is used to be dressed and eaten by the inhabitant of the Sea coasts where it groweth after it is cleared from the skinny wings, and bath a little sweet taste with the shi-Sea coalts where it groweth after it is cleared from the skinny wings and bath a little sweete talle with the salenesse which maketh it the more acceptable.

5. Fuom maximus polylebides. Great Sea girdle with many Labels.

The manner of growing hereof, and the use likewise is alike with the last, but is the greatest of all these some of Sea weedes, having a stalke as thicke as that of Angelica, of a browne colour like a Chesnut on the outlide, and fo are the round leaves likewise, which are three or foure cubits long being not so thicke as once little finger, and fo are the cound leaves likewife, which are three or foure cubits long being not to thicke as ones little inger, and ending in divers broad and thort skinny Labels, in like manner as the lower part of the fwords hangers, which are of a yellowish colour. Both shefe last forts were fent unto Beabisson from Aberdein in Sestend, by Destor Cargillus, and as it feemeth this and the second are somewhat differing from the labelens figure and description, which contained both of them in one, yet I have thought good to give you his figure, for want of them severally although his groweth from aroote, and this from shels, &cc.

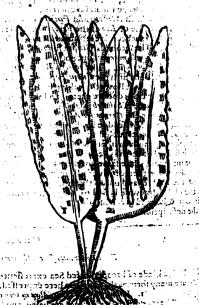

6. Fucus marious secundar Destones. Narrow long and thicke Sea girdles.

The roote hereof is round and flat, from whence fpring two or three narrow thicke leaves, about a focused halfe long, divided into fundry flat thicke thongs like leather, forme long and forme floorer, and they again divi-

12. Opuntia marina. The Sea Ganland

8. Fuem maritimen Gallepavenie pennas referens. The Peacockes Feather.

This also is of a skinny substance, spreading it telfe by little and little wide abroad, cut into many Jagge, which end in halfe circles, lying sometimes one upon another, whereon are set sundry semicircular spots, and strokes of divers colours, and of differing bignesse one from another, like as is seeme in the Peacockes seathers: this growest to the Rockes in the Sea: somewhat like hereunto there is also a certaine barketaken from Scallops, that breede on the same Rockes.

9. Fucus marinus Lattuca marina dictus. Oyster greene, or Sea Lettice,

The Oyster greene, as all know is a soft tender herbe growing on Rockes, with thinne crumpled, and darke greene leaves, somewhat like unto the curld Lettice, and hath neither stalke nor roose, but growing a most of these Sea weedes doe, upon Rockes or stones.

The Sea curld Endive, that divers long and round leaves lying on the ground, and shooting forth other on all sides, as it runneth thereon, sending out small sides, as it runneth thereon, sending out small sides from the joynts under the leaves, which are dented roundat the sides, making the proportion of a ragged staffe, as it is painted on every leafe.

This likewife in the same places, and after the same manner groweth on the Rockes, and lyeth thereon far; when the water is falne therefrom, shooting forth many long stalkes of leaves, to a great length, cut is and divided somewhat like unto Oaken leaves, set here and there with blisters, as it were berries sull of winde, and some full of water, which being troden on will give a cracke, the whole berbe is of a very greens colour, soft and tough, which while it is were like were skinness. Some doe call this herbe Quercin market are intessible, by reison of the small round knots, which is like hollow berries, and is blacke being dry. Associate the intessible solden she middle side of the she being somewhat like the other, but with shorter leaves, and some also growing from the middle side in the intessible she is dry. Another leaves, and is white when it is dry. And a third fort called Quercun mari-a barbata, because the ends of the leaves are very finely on into long hairy threds, representing a beard.

12. Opuntia marina, The Sea Garland.

This dainty plant groweth up from some Rockes or Rones, in or meere the Sea, spreading sundry flat, thick, short and round leaves, one set on the toppe of another, and some also growing from the fides, soming branches of leaves leaning downewards, each being as it were flrung on a threet, which yet is fearly to be different, likes a Country Garland of field and corne flowers, are used to be made to decketche. Country houses, and their place of sport, so that the whole plant seemeth to be made of nothing but strung leaves, beating a large yellow flower at the toppe saich Bankhins, but I much doubt be taketh that supposition from the Fiscal Indice. Survices, the lower leaves are somewhat browne, the rest are whitish greene, and those that are new spring are greene, and all of them smooth and shining, even kept betweene papers for a long time, and of a said house, yet by long time growing rougher and full of wrinckles, but still tough and not brittle like Corall or Constline, and growing soft againe steeped in water, yet still very sait.

The Place and Time. .

Divers of these are found on our English and Scottish coalts, but some in the warmer Countries, their cheifelt time of beauty and use, is the end of Summer.

The Names.

The Names of Phocos.

The Names of P

Alga marina, and by Banhinus Alga angustifolia vitrariorum, the broader fort is called by Imperatus Fucus giganuni, and Palmifolium giganicum. The second, third, fourth, fifth, seventh, and eighth, are set downe by Banhinus
in his Prodromus by the same names in their titles, or very little differing. The sixth is likewise set downe, in the
inde, and is likely to be the Fucus Zossey, by Lugdanensis to whom it doth belong, which Banhinus in his Prolemins called Fucus longs angusto & crassforfile. The ninth is the first fort of Fucus marinus by Dioscrides, and
called Bryon Lastruca fully by Pliny and Lobel, by Matthiolus Musicus marinus alter, Dodoneus calleth it Fucus marints prior, Lugdanensis Angless marinus Theophrassis, and by Banhinus Fucus marinus Dioscorides & Theopassis. The tenth is called Fucus sive Alga Intybacea by Lugdanensis. The eleventh with the varieties thereof
are mentioned by Lobel and Clussus calling it Ouercus marinus, by Dodoneus and Banhinus Fucus marinus. The
id wis first set forth by Clussus under the name of Lichen marinus, and saith he received it first from Imperatus
of Naples, by the same of Servalaria, and after from Cornsus by the name of Opposita marina, and Corallina lastifulia Banhinus calleth it Fucus folio rounde in his Prodromus, but Fucus maritimus in his Masthiolus.

The Vertues.

All the kindes of Wrake, faith Diofeorides and Galen, doe coole and dry, and is good to eafe the Gout, and infimmations, being used fresh, but Lacons corrected the cooling word in Galen, and faith it doth better agree with Sea plants, to dry rather then to coole, by reason of their faltnesse, which doth binde and constraine, but not note, Nicander in Therinein, commended the red fort of Fuera to be good against the venome of Serpents, and other venemous creatures. The first fort is much used by the Venetians instead of hay of straw, to packe up Glasses upsterve them from breaking, but at Mompelier and other places, they use it as litter for their horses; and being making composition composition sexcellent good manure, to refresh their barren or out eaten grounds: divers of the other fort are eaten as faller herbes, as the fourth, sitch, and twelstin, the seventh as is said, is good to repress the hurtfull longings of women with childe, and Chasses said that Corrusian significations that the commonpeople of Corregion signification in that the commonpeople of Corregion significant could be sufficient to kill the wormes in children.

" CHAP. LIII:

Muscus marinus Corallina dillus. Hard Sea Mosse or Coralline.

Coording to the method before prescribed I am in this Chapter to shew you all those forts of hard Mosses that are either Coralline or come neerest to them.

1. Mascus marinus five Corallina alba efficinarum. Common white Coralline.

The ordinary Coralline which is used in the Apothecaries shoppes, is a fort of white, hard or stony Mosse, growing usually on the Rocks into neere the Sea; rising either from the stones thereof, or from the shels of Scallops, Oysters, or the like, and groweth not above an handfull high, spreading sundry small branches like a greene herbe, with divers small short leaves, like haires thereon, which is soft,

ding fundry small branches like a greene herbe, with divers imail mader the water, but taken forth groweth as hard almost as a sone. This is our ordinary Coralline, which is gathered in all one Coalis Westwards, and in these Northerne parts of Europe, a farreas I can learne, but some have affirmed that it hash beene found somewhat reddish, growing upon the Corall it selfes, which is not sound but in the deeper Mediterranean Seas, on Rockes under water.

2. Muscus marinus niger Germanicus sive Corallina nigra.
Blacke Germano Cqualline.

This groweth like unto a Coralline, with branches and fine cut leaves, but blackish of colour, which is a fort seldome heard of before, and creepeth as it groweth.

3. Muscom marinus sive Corallina rubens.

Reddish Coralline.

This fort of Coralline hath no branched stalkes like the formentor spreading much, but growing more upright, hath longreaves thereon then the other, as sine as Fennell, and of a reddish colour.

4. Museu marinu latifolism five Corallina latifolia.

Broad Coralline.

This broad Coralline spreadeth leaves as it were on both sides of middle stalke, each whereof is broad, and parted into sundy divisions.

5. Muscus marines longifolises sive Corallina longa.

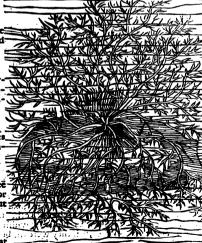

Long Coralline.

This Coralline hath divers upright stalkes set with two, three or four long leaves by spaces, one above another, in three or four rowes, each whereof is somewhat star, and dented or cut hall along the edges.

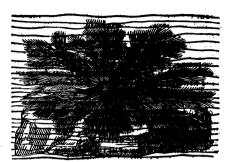

6. Muscus marinus squammatus sive Corallina squammata,

This fixt fort of Coralline hath findry (prigs, with joynts at them, like unto feales, and finall hathy Moffe like leaves on each fide of them, being wholly white.

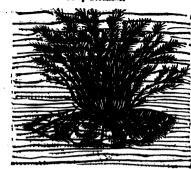

I. Musicus marinus five Corallina alba.
Common white Coralline.

3. Mufaus marinm rubens five Corallina rubeus.

Scaly Coralline

The Place and Time.

All thefe Moffes are expressed to grow on the Rockes and stones, in and by the Sea, and are to be found growing at all times of the yeare.

The Names: All these forts may be referred to the Belov Sundanov Musicus marinus before set forth, both their place of bree. ding and manner of growing declaring it, and came to be called Corallina chiefly from that fort that grewupon Corallit (elfe. The first is the Majeus marisms of Matthiolus, Dodoness, Lugdaness is and others, Lobel calleting Corallina, and Lugdaness Fracus capillaceus. The second Bambisms onely remembreth in his Pinax, to have teceived it from the Balticke Sea, calling it Museus capillaceus multisidus niger. The third is the Museus mains vulgatiffimms of Lobel, and the lecond Mufcus marinus of Dodoneus, Tabermentanus and Gerard. The fourthis the Museus Coralliformie of Lobel. The fifth is the Corallina minima in the new Gorard, whose description doth nothing answer the figure, for Gerards figure is quite differing from this yet is answerable to his description. The last is called by Lobel Museus candidus Covalleides squammulis levicatin, and is the third Museus marinus of Delenews, although the new General doth entitle another figure by that name, and giveth a description farre differing from his figure.

The Vertues. Coralline is in a manner wholly frent among us to kill the wormes in children, or in elder persons, and as the matter fo the manner, not knowne but in thefe latter times to Authours, but by what quality it worketh this effect is not declared by any, for it is altogether infipide, or without tafte of heare or cold, as Corall it felfe is, and if Corall be so much commended against the stone and sluxes, crampes, the falling sicknesses, and metancholly, acc, as you shall heare in its proper Chapter doe not thinke but these may conduce somewhat thereunto also.

CHAP. LIV.

Frutices Coralloides five Coralline fruicantes. Shrub Corallines.

Nto the Corallines mentioned in the last Chapter, I must adjoyne sundry forts of wooddy, gritty, or flony thrub like Corallines, as I may to call them, of feverall differing matters and formes, which I would place in a Chapter by themselves, and neither mingle them with the former Corallines, nor with the next Corals because different from both.

1. Coralina president alba. The white crufted Shrub Coralline.

This white Shrub Coralline groweth up from the Rocke or fome thell, in forme of a famili flurab or low sree, to a cubits height, more or leffe, with a flat flemme or trunke below, and finding flat branches alto iffsing from it on both fides, and not round like an ordinary flumb or tree, which branches are divided into other finaller fpring a bove, and those againe into lesser, it is wholly covered over or crusted with a white insideralt size unso Coralline, or white Corall, but rough or rugged, the middle part or heart being wooddy and bending like the branch of a tree, yet very hard alfo.

2. Corallina frusicans rubra. Red crusted shrub Coralline.

This red Coralline is like the former in all things, saving that the colour hereof is in some wholly of a reddish colour, and in others the branches part white, and part purplish. And another fore chesces also, that is of a whitish yellow, sported, which as I take it Bankinus calleth Corallina pallide flavostonesis coloris, & Intea punitata, for I thinke them both one

3. Corallina lignefa ruffeforus Erice fatto. Brownish wooddy Coralline or Sea Heath-

This fort allo groweth flat like the former, and from former from the Rocke risets halfe a yard high or better, with divers spread branches, divided against into other smaller ones, somewhat like unto Heath, spreading almost toa yards breadth, all covered with a thinne brownish barke, and a very hard wooddy subfunce underneath, for thicke with small knots or bunches, as if they were the buds of flowers, easily rubbed so pourther: the whole plant being

4. Corallina plumata five Myriophyllum Pelaginas Corinfi Clofia. The Schwonian Sen Feather. This Sea Coralline (for fo in substance it is not unlike, and Cortufus found the effects to be alike also) groweth not as the former, from fome frome or shell, but out of the ground in the Sta, from a roose fastened therein, with very pround in the say, state with a flender stalke, (as Clufus shested by the sight of the sigure about a cubits height) which did fend forth branches of long leaves, very finely cut into many long parts on both fides and bending the toppe downer many tong part of the branches of the Date tree, or as I may (14, unto a Feather, of a pale or whitish colour : the upper layer are ignaller then the lower, elfe alike, and the toppe of the flake endeth in a corraine head, composed as it were of density feales wherein is no fleede, there feales being as it were young plants, which falling to the bottome of the wa-ter ake roote therein, and grow up like the mother plant, termeterogic unersay, and grows as another morner plant, this while it genericals in the bracter, or is fresh new taken the bracker and plant to be bended any way, but when it is dry it is as bated as Confession or Glasse, and as brit-

into smaller sprigs, which containe five or fixe, or more rowes of short hollow leaves like pipes, almost like and the leaves of Lavander Cotton, some part of the lower leaves being broken the upper part was whole, being of a purplish colour the rest white, of a stony salt substance, shewing the original to be the Sea.

7. Salin marina. The Sea Willow.
This groweth likewife upon Oyfler fhele or the like, rifing up with fundry stalkes, of a grayish red colour, and fet with narrow long leaves like Willow leaves, which lye on the water, some being smooth, and some a little waved or dented about the edges, among which tife also other stalkes bearing flowers like those of the Willow, with many points like the scales of the catkins, when it is ready to bloome.

8. Androface Matthioli feve Cotyleden marina & Umbilicus marinus. The Sea Navoll. Least this Sea plant (if you will to call it, or what else you please) should be enite lest out of this Classis, let me thrust it in, in the end of this Chapter, being a sea excressence, formed like small round sawsers, hollowish in the middle like unto a Navell, and borne up by small smooth sociestalkes about two inches long, every one by it selfe, product like unto a Navell, and borne up by small smooth societalics about two inches long, every one by it sire, from some store, or rocke, or shell in the Sea, or falt pooles, busing of a pale greenish ash colour, while they grow under water, but afterwards grow as white almost as Corall, or the like; and of is they grow rally called Androjace Mathibility divers authours; became hearth fet is forth, being seat him from Pija by Lucus Ghinus for the right, and Label seament to be of the same mainteen of herer thereunds, alling is Corpletes falling and mainteen Publishing pairings Manifesting in the Galaring is seen that the comment so neere thereunds, calling is Corpletes falling an mariness minimum. For it can no way agree in my indement upto the Androjace of Disforders, if we will believe its know the thing he water of, for he saith, it had no leafe but a huske with seed in it, and doth appropriate where the shing he water of, for he saith, it had no leafe we been each of the control of the control of the control of the control of the saith, it had no leafe but a huske with seed in it, and doth appropriate where the saith has been controlled to be the lake or seed of the saith of the saith of the saith plant bath no controlled to be a saith of the saith of

1. Spengia marma njualis.
The ordinary Sea Sponges.

4. Sponglavanofa altera Anglica. Another branched English Sea Sponge.

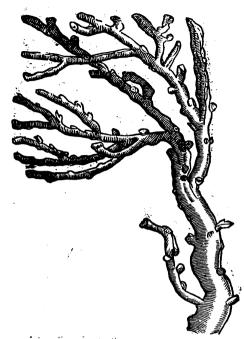

colour that it holdeth, being as all know of a fost substance, neither slony, wooddy, nor herbe like : but rather like a peece of wooll or cloth fo wrought together by nature, that being full of holes, it is ready to receive and hold much water and by preffing or wringing ready to yeeld it out againe, but as it encreaseth in the water, it gathereth into it, or else there is driven into the holes thereof divers small gritty stones, which are usually found therein, declaring the breeding thereof, not to be farre from the ground, by the receipt of these stones. Ariffotle in his fifth booke and 16. Chapter. de bifforia animaor their trones. Arisotte in marita booke and 10. Classes, faith that divers did thinke and fay in his time that Sponges had sence in them, for that (as they say) they would shrinke if any did plucke them, and were hard to be pulled up, and that they doe so likewise, when the surges of the Sea would breake them off from their residence, the saith Arisotte in the season of the s fame place, divers did doubt of the trueth of that relation, and those were they that dweltar Toronia. I have beene bold to infert this proofe of Aristorile in this place, to refute the opinion of those that hold Sponges, and the like to be Zoophyte, sensitive creatures, for all though affirmed in Aristotles time, yet doubted of them also : and therefore wee that have beene hence taught, and in a Schoole of farre greater knowledge, both of Divine and hamane things, may well call of fuch foud conceits.

2. Spongia infimation if formatic. Funnell like Sponge.

This Sponge Lusius hath fer forth to have feene cleaving to a very hard blacke flowe of twelve pound weight, and was broad above and narrow below, where it grew to the flowe like unto a funell, or to the flower of an herbe yet not of an equal height at the brims, which also were so turned inwards that they seemed to be like leaves soulded inwards. One faith Cluster, I remember I law while I lived at Mompeller, that did most exactly resemble the forms of a very large hat. 5. Spongtaramoja fifinioja Veneta.
The Venetian Sea hollow Sponge

6. Arbufcula marina spongiofa Coralloides.
A Spongie Corall like tree.

3. Spongia ramofa Britanica. The branched English Spong.
This faith Lobel I found in the 1le of Portland, among other Sea excrements, which for jubilance and colour, you would say was a Sponge, but if you marke the forme of branches in it, you would say it was neere a Coralline, brit was neere a handfull and a halfe high, full of blifters, foft and essie to be bowed any way. Some would take this to be the Isados, Plocamon of Pliny, that was like unto Corall without leaves, growing hard changing the co-tour to be blacke, and ready to breake it it fall, which is more likely to be the Antipathes or blacke Corall of Dio-

4. Spongiosa marina Anglica planta nodosa. The English toft Sea ragged staffe. This foit Spongie plant hath beene found on our Kentife Sea shore, by Master Iohnson and his Associates, in a imping voyage to those parts, and is about the thickenesse of ones thumbe, about a foote in length, set with many uberous, uneven or knagged excressences on all sides, like unto short branches, being very sappy, and of a soft Spongious substance, and of a brownish yellow colour: it was not observed growing, but broken, and among other fuch like things cast upon the shore.

5. Spongiaramo (a fiftulofa Veneta. The Venetian Sca hollow Sponge. The Fenetian kinde groweth on Rockes in the Sea like other excressences, rising up as it were with stalkes, and briking out on all fides into fundry short branches, the substance whereof is Spongy, and hollow, as soft at the fill, as the crumme of bread, which may then be made into paste, and afterwards being dry, may bee made into

6. Arbufqula marina spongiofa Coralloides. A Spongie Corall like tree. From the largenesse hereof Classia calleth this a shrubbe or low tree, being three soote high, and seven inches compafie at the bottome, which although it seemed firme and folid, yet was but of a Spongie substance, and white additing like unto dry Ginger: both the trunck or body with the many branches thereon, were fet full of knobs, the tranches themfelves ending in greater, which were foongy on the infide, but without any feede in the feeming parameter of the outlide like states. The whole plant was covered with a thinne knobby reddish barke which colour Classia who first fee it forth, doubted was not naturall, because he saw others the like which had twhice coate) but of so falt a rafte, that the falt it selfe did not exceede it. Within a while after (Classia saith) Altera. he faw another which was fix foote high or more, being wholly flat and halfe a foote broad and two inches thicke, fet with branches and knobs in the like manner.

The Place, Time, and Names: Are lufficiently declared in their descriptions forthat I shall not neede further to insist thereon. The Grecians alliterly O, The Latines spongia, and so doe both the Italians and Spaniards. The Arabians Afferagi albairs of allo. The French Esponge. The Germanes Badschwam. Ttttt

The Vertues.

Sponges are put to many uses, buth civill and Physicall, as for fomentations or bathings, which moistened and Sponges are put to many uses, buth civili and Phyticali, as for romentations of the amount of the decoction, much longer and stronger then either linnen or woollen cloth; applyed contains the warmth of the decoction, much longer and through the colofe, before they be throughly clenfed and healed, doth open the fores againe, being to be pulled forth by the third is faftened thereto, before the put in: the aftes thereof mixed with a little wine or vinegar, is used to cleare the eyes when they are blooding. be put in the affice thereor mixed with a little wine or vinegaria after to the that are troubled with the flone, ten, or watering; the flones in the Sponge are used by some to be given to them that are troubled with the flone, to helpe to breake it, and cause it to passe away with the urine. The **Uenerian** Spongie plane is said to clense the face, being washed with a decocion made thereof in honyed water, and is a remedy for them that have exten dangerous Mushromes to be boyled in Vinegar and taken the pouther thereof taken in Wine purgeth like Crestor Tariari, and cutteth and thinneth groffe and viscous humours.

ching, being found out by the Dutch and others, in their Navigations to the Northward, as that third of the Dutch in Anno 1536. doth declare.

CHAP. LIX.

Muscus terrestin. Land Mosse.

Aving shewed you the Mosses and excressences of the Sea, let me exhibite also to your knowledge in this place, and not put them to any other, the Mosses and Mushromes of the Land; The varieties whereof are many, and therfore to be divided into those that grow on the ground, and to those

that grow on trees and other things of each of these in their order.

1. Museu terrestric volgatissimum. Our common ground Mosse.

This common Mosse that usually groweth in our mosse woods and the bottomes of hils in bogory grounds, and shadowy ditches and places, groweth very thicke together with many small single stakes about a sorte high sometimes, and often not above halfe the height, with a number of soft seaves like haires, growing thicke and close together, the toppe whereof in the hottest time of Summer will be somewhat round and which the state of t tifh, the whole tuffocke is often found differing in colour, being either greene or reddiff, or of a whitish yellow, it hath very faort rootes fastened in the earth.

2. Muscus terrestris vulgaris alter. Another ordinary ground Mosse.

This other Mosse that is more common in Germany, &c. then withus, groweth up with many branched stalker

of long winged but short greene leaves a most like Heath, smooth, and foft, and not hard like heath, it spreadeth on the ground and rifeth not above halfe a foote high.

3. Muscus terrestris scoparius. Beefome Moffe.

The Beefome Mosse taketh the . name from the manner of the growing thereof, which is, from a finall head below, fending up di-vers thining blackith purple ftalks of winged green thredlike leaves about a foote high, which spread themselves out broadest in the middle, at the top whereof breaketh forth fometimes small yel-lowish heads which fall enickely away without any feede following them.

3. Mufcus terreftvis fcoparius.
Beclome Moffe.

THE BELLA

. Heart Moffe, or Wolfes of Wolfes olaw Moffe,

Mafcut denticulatus majer & minor. The greater and I fler dented Moffe.

4. Muscus clavatus five Lycopodiume Club Moffe, or Wolfer claw Moffe. The club Mosse runneth upon the ground pagreat length, breaking into other long number anches, thooting forth fibres into deground as it creepeth, being made of may thort yellowish green hairy leaves a the joynts of the branches grow in fet-mal places two or three final round and

mill places two or three small round and hay ellowish scaly healt, like the catking abouting of the Hazell tree, which as in the other Mosses come to nothing, Mustan denticular major of minor. It greater and the letter danted Mosses. Both these forts of Mosses grow one literate another, but one literate another, but one literate another and each of the minor what like unto the last, rooting in diverse places, as a much on the ground: the stalks are as fall as haires almost, upon which srow miles haires almost, upon which grow the faul teshers almost, upon which grow the faul leaves thicke set together, as if they were scales, laide close one unto another, the ends of them striking out like min, we have not feene what flower or

fick it beingth of it have any.

6. Chuscus penutrus major & minor.

Winged Mosse finall and great. Both theie Moffes also neede but one defription, not differing but in the largemile, and multitude of branches, one from the offer processing on the afformal and rooting as they runne, whose stalkes and short banks are thicke fee with fine yellow. h groene leaves like wings on both fides, and thereof tooke the name : thefe grow

in woods as also upon Rockes and Rories.

7. Malcus picased repents

Greeping Mosse with spiked heads.

This Mosse groweth hard by, and under trees, creeping farre with thicke, and long branches, which send forth many

1209

a greenish heads on them.

9. Mufepsparen ficilarie. Heath Moffe.

11. Mofest pynidates. Cup-like Moffe.

many fine leaves clole fee together in manner of long fpiked heads, one fort being greene and snother white. 8. Mujem eredin ramefus m

The greater branched Moffe.

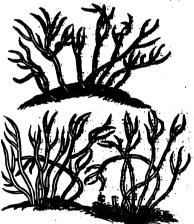

The greater branched Moste, and close together like a turfeor suffocke of fligh graffe, whole stalkes are
three or foure inchestions, spreading into branches of two or
three inches apears, and those into others againe, all which
are covered with very fine haires like leaves, among which
shoote forth small naked stalkes of an inch least, with small yellow round heads like wheate corner. There is also a lefter hereof whole fialkes are factor and leaves for issall, that they are scarse to be discerned.

The fralkes of this final Molle, rife, there is the control of the

which have many finall pale greene flames pointed leaves, fer at the toppes of their finall flakes, in manner of a Rofe, fpreading forth like a li tle ffaces, this growed upon Rockes and

The leaves of this Mosse that has like Liverwarz creeping upon the ground are of a which has like Liverwarz creeping upon the ground are of a which has like another as the finall hollow heaves like cape that rife from them are also. There is another fort here of growing matern the ground as the former, but on rockes and from a whole cape are finaller, more immunities and not so white.

hu corniculatur. Horned Mosse. This horned Mosse which groweth on those rocky barren hills, and rocky grounds, where almost nothing will grow, riseth out of the ground, with divers stender weake and somewhat broad states or fours inches high naked and without leaves from the hottome to the toppe, but pured into finalles branches, and they again into leffer, which are forked at the ends like unto hornes of a disky white colour. 13. Majon

The Theater of Plants.

13. Muscus minimus terreftris. The smallest ground Mosse. we have a small kinde of Mosse (usually growing with us not onely upon those grounds that a e not stirred or we have a think the order of the analy growing with us not onery upon those grounds that a e not firred or gradup for two or three yeares together, but in flower pots of earth in Gardens oftentimes, especially some produptor two of which is nothing elfe but a number of greene front haires matting upon the ground, which in the beare of Summer, and fometimes fooner will fend forth small short stalks an inch high with small yellowish

The Place and Time.

all the sare in a manner particularly declared where they are most usually growing and are in their persection inthe Summer time. The Names.

Moffein generall is called in Greeke βρύοι and σπλάχτοι, and in the Atticke tongue Sphagnum and Hypnum, and The thereupon in one place calleth it in Latine Bryon and Sphaginim and in another place Sphagnos five Phacos five Nothereupon in one place-calleth it in Latine Bryon and Sphaginin, and in another place Sphagnor give Fhaces five Ingain Latine it is usually called Musicine, and properly betokeneth any herbe that is composed of haires or threds what is composed of haires or threds what is composed of haires or threds what of leaves. The first here fer forth, is the Musicine verifies out of Lobel, and Dodnaum, and hought by Latining to be the Musicine betreiffs of Trague, but I suppose rather his is the last that I here set forth in this Chaptains, and notice other that I knoote growing so samiliar in Gardens? The second is the Musicine montaning of Indianautians, and Musicine servessible of Gerard, which Baubinum calleth Musicine Denticulating southat it rooteth not as it lyeth: The third is the Musicine separium of Indiand others, and Selago versia of Thatim. The south is called Musicine slavature by Lobel and Dodoneus, who calleth it also Lycopodiums tragm Matshiolous, and others Musicine serves for the manuscine Lorentee Condition. of Thiling, Geforer in fratti mont je descriptione calleth it Muscus & finen, and fee it forth for Chamepence Cordinin of laume, series in fraction may reperfer the control of the series of t In Cluster. The fixth of both forts is mentioned onely by Bankinus in his Pinax and Prod.omns, and fo is the feremaio: The eight is called by Baubinus Muscus ramosus extens major or minor. The ninth is called by Lobel Muscus rections major or minor. The ninth is called by Lobel Muscus residence and by Baubinus as it is in the title, Muscus parvus stellaris: The tenth is by Baubinus as it is in the title, Muscus parvus stellaris: The tenth is by Baubinus onely called as it is in the title, Muscus stellaris roseus: The eleventh is the Muscus pridatus alabastriculos mins by Lobel, the other fort whereof Baubinus calleth Musem priviodes saxatilis, as he did the former of Lebel, minor by Cornition of the twelfth is called Muscus ceranoides major. & minor, by Banhinus, and no doubt is the Muscus curnitulatin of Tabermontanus and Gerard, however his Corrigidor hath put as he saith a better in the place, untily the Filix perres of Tragus, when as no other Authour doth referre it to any of the Mosses, but Baubinus whomistooke his reference herein, for as I shewed in the description thereof among the Featnes, that hath spots

whomistooke his reference herein, for as I shewed in the description thereofamong the Featnes, that hath spots on the leaves as other Featnes and Capillare herbes have, which argueth it plainely to be of that samily, and no hole, and Baubinus his description of his Muscus ceranides major, doth plainely agree with this consiculatus. The list although best knowne to many, yet little regarded by most, and not mentioned before by any except Trapishis be it.

All the Mosses are somewhat cooling and drying, and thereby stay stayes and bleedings, these earth or ground kosses, especially the sinst and the source, are held to be singular good to breake the stone, and to expell and drive it to by urine; being boyled in what and drunke, the herbe bruised and boiled in water, and then applyed to any islammations or paine prings from a hot cause doth allay and ease them, and therefore many doe apply, it to the largout to ease the paines absenced. The cup Mosses is aid to be specified chincough in children effectually, if they was the pourher thereof for certaine dages together. The cub Mosses hung in a vessell of wine that hath lost the vigour and vertue, to make as is convenient for the bignesses of the vessell, is said in short time to recover it agains, whereupon Brung-lipus called it was known, the Wine herbe.

CHAP. LX.

Mufcus herba formis & coralliformis. Mosses that resemble some herbes or Corall.

Here be divers other forts of Mosses that have some relemblance, either to some herbes or to Corall, and because I thought it fittest to ranke them together, I have as you see kept them out of the last Chapter, to insert them here into this.

I. Museus clavatus Cupreffformis. Cypresse like Mosse.

This small Mosse abideth alwayes greene sending forth sundry hard branched stalkes, with very short and thicke leaves settled upon them, somewhat resembling the branch of a Ci presse, bing of a darke greene colour, from the top whereof fometimes come forth [mail and fote spiked heads standigon small foote stalkes: Another somewhat like hereunto is remembred by Banbings, which he entituleth Mus- Altera.

a Capreff formie ramefett, to dillinguish it.

2. Mujou Abietu facie. Fiere like Moffe.

The Fitte like Monte groweth close upon the ground, and treeping thereon with findry long branched stalker, with fine short hayric greene leaves, set on both sides of the middle thereof, resembling a Firre tree branch, Mofen Pilicinus, Estruelike Molles whereof it tooke the name.

There be divers forms of this Moffe, forms bigger and forms leffer shan others, all, of them rifing up with fundry lakes forms blackift, forme reddift, and fine leaves on them much like so Fernal cauca, but in tome more tinely leged or cut into feverall parts than in others, on the toppes of the branches of the leffer fort hang finall round pointed crooked heads.

There are three form of this Mosse, the one bath many short stalkes thicke covered with short, but somewhat Ttttt 3

Alter.

1. Majous clausem Caprefifernia. Cyprefic Moffe.

8. Mu/cus Coralliam montanus

Mu'ens Coralloldes faxatile. Rockie Corrall like Mosse.

hard, rough, haire like leaves, the other is leffe in each part, and the leaves not rough or hard at all the third is the least and the leaves smoothest: the first groweth in wer wood grounds and the other upon old walls.

5. Muscon fanatilis Ericoides, Stone Heath Moste, MA: 2. Gille This small Mosse hath many small hairelike leaves, next the ground like unto the common ground Mosse among which rife rough stalkes an hand bredth high, in some places bare of leaves, and covered in the rest, with many such like small leaves, as are growing on the Erica Corie, the faire heath low Pine; but without order; on the tops of each whereof standeth a small head.

6. Muscou serrestrin coralloides incanus, Hoary Corall like Mosse.

This Mosse is all heary white about a foote high, whose upright branches are thicke, solide, and not hollow, divided into many branches, each whereof is like a ftagges horse, and fharpe or finall at the ends.

7. Mufcus servefiris cor all sills rafe formellus cornibus en Reddift. Corall like Moss.

Among the ordinary ground Moffedoth this Moffe grow, and is a fine fight to behold the pale greene ordinary Mosse to grow on the ground, and this Mosse being all white to grow out from among it parted like Corall into many branches hard or rough in handling, but the ends or tops of diemail see of a yellowith or reddiff colour, like small hard or rough hornes. 8. Museu

The Theater of Plants. TRIBE 14.

CHAP.61.

8. Muscus Gerallinus mentanus. Mountaine Coralline like Mosse. The Coralline like Mosse is a small low whitish dry herbe, with small hollow stalkes, not stony nor hard at all, be firely cut and divided into many parts, much resembling the true Coralline, this is often found upon dry

Heath grounds. 9. Museus Coralloides saxatilie. Rockye Corall like Mosse.

This groweth on the Rockie hills among other Mosses in Naples as Columns faith, whose branches are many dechending in a twoforked like horne, fomewhat like the double forked horne of a Stagge, being hollow recent without, and white within but of an evill earthy feat, there is an other fort of a grayifh aft colour and Altere and leffe than the other, growing in the same place with the former. The Place and Time.

The places of most of these are express in their discriptions, and they keepe the Summer time for their flou-The Names.

the first is called by Tragus and Cosner in borete Sabina streets, and by Thalius Selaginia Pliniane prima species to Play in his 29, books and 11. Chapter bath these words, simila berbe Sabina est. Celago appellata, and therefeel doe generally hold this to be his Selago, not finding any other herbe so necessive estemble it, although hee all saims an herbe which is a tree, Turner and Tubermentanus call it Chamer pariffus, and fo doth Gerard, but by all not meane Lauender Cotten as Gerard doth, but a kinde of Mosse, which Turner fitty Englished Heath begind not meanly Laurines. Content on oversity to the action of money which is a sea Plant, as is before the well in the fector of the feet of the fe Majes corallings five Corallina montani, but yet Gerard was much miltaken; to understand this of stone or Sea Coralling, which is hard like Corall : the last in remembred by Columna in the second part of his minus cognitarum finism, and calleth it Lithobryon corallisides.

There is nothing recorded in particular of any of these sorts of Mosses, to be available for any griefe or

CHAP. LXI.

Mulcus arboreus. Tree Malles.

Here are other forts of Mosses which grow upon trees, which are next to be spoken of. 1. Muscus arboreus vulgaru & Quercinus. Common Mosse growing on other

trees as well as Oakes. The usuall Mosse that generally groweth on all trees, is nothing else but a number of haires issuing from the bodies and branches of them, in some shorter in others longer, all for the most part hoary or of agrayish white colour, which yeeldeth neither roote nor stalks meither flower nor fruites some onely are said to be reddish, and sometime blackish, which is the world for of all: It groweth upon sundry trees, upon degreat Cedar as Disserides faith, which is the belt of all other, and is very furete: the next in goodnesse (hith he) is that which groweth on the Poplar tree, especially if it be white and sweete : that which groweth on the Oake, faith he, is the worft's It is also found growing in severall Countries on fundry other trees, Matthis commendeth is for the best, the whitest, and the sweetest that groweth on the Larch tree; others thinke that to be as good that is found upon the Pine, Pitch or Fire trees. Cassas lain is found a kinde of ash coloured holle hanging downe from the armes and boughes of the lex, or ever greene Oake, in some places of

2. Muleus quereinus Formiculadeus. Fennell, like Oake Molle.

This Mosse usually groweth upright on the bodies, and the Elder armes and branches of old Oakes and sometimes on Beeches also, fallening a small brackish roote into their barke, and from thence sendeth forth sundry finder blackish branched stalkes about two inches, with a number of most fine grayish Fennell like leaves which finell somewhat sweete, at the toppe whereof stand small round hollow vessels a little rough or hayric about the

himnes, which quickely fall away without any feede following them.

3. Majens givenus fruite far: capitalis caves. The Mosse with hollow heads.

This tree Mosse hath stollow stalkes, with broad flat leaves, somewhat hayrie on both edges, the heads are hollow, with a blackish umbone in the middless of them, and sometimes compassed about with a dented verge: this but some thort branches spread divers wayes, and is wholly of a grayith ash colour.

4. Museus alter querums latifelius peralloides. Oake Mosse with broade horned leaves.

4. Muleus alter querums latifelius for alleides. Oake Mosse with broade horned leaves.

This Oake Mosse is of a whiter ash colour, branching it selte into many thicke and broad parts, like unto the bones of a stagge, bearing at the toppes of them certaine small vessible of the bigness of Givers or Ciche peason whebingest. This doth iometime grow hunnipus swelling greater from the bettome to the toppe.

7. Muleus arberau modeling for greaters. Roobsed or kneed tree Mosse.

This grayish Mosse is very frequent in Lesty, thanging from the trees with a large forced buth of haires, a soote an iometimes baile a yard long, with divers small knotted joynts like tends, growing upon them towards the lover end, which are hollow and doe to grow us if they were strung together. Jone being lower and others shorters has been ter than the reft.

This kind of Mosses pulmonarism for Cichen arborusm. The Lungarette.

This kind of Mosses from the coloured or grayish tough leaves, diversely foulded, crumpled and gethed in of the edges, and spotted also in some places with many small spotes on the upper side, it never was seene to beare any stalke or slower at any time.

1. Museus arboreus vulgaris es quercinus.
Common Mosle growing on other trees as well as Oakes.

3. Mufcit queraus fraticofia capitalia catia Tree Moffe with hollow heads.

CHAP, LXIII.

Funni esculenti. Holfome Mushromes that may be eaten.

N the handling of these Mushromes I must take a differing course, and manner then I have observed formerly, or shall doe hereaster, for concerning these, Time, Names and Vertues. I will speake of so many of them in their recitals, as shall be sufficient to expresse whatsoever is contingent unto them. the most usuall forts of Mushromes, have small smooth sound heads, shading upon thick shortstalk, and are for the most part white, yet in some the upper skinne is brownish or yellow, burgenerally more yellow after they have flood long and are decaying, most of them are somewhat flat and hollow underneath with many lines running directly from the middle to the edges round about the substance of them generally, is loofe and spongy, casily yeelding to be broken betweene the singers if they be but pressed a little hard: the tale or rellish of them is no doubt according to the soile and place where they grow, for those that grow in the open champion fieldes and medowes, are not onely fafer from danger, but of better rellish then those of the same kinde that grow in woods and under trees, I speake of them that grow in our owne Land: agreeing with Horace in his fecond booke and fourth Satyre, who faith,

pratensibus optima funcia Natura eft : alis male creditur.

But I know Clasius faith the Hungarians, Germanes, and others, doe most esteeme of those that grow in the woods and chiefly of those under the Firre trees, and next unto them, those that grow under Oakes, the ordering and dreffing them to be eaten is diverfly, as every one pleaseth, some boyle them and draine or presse the water out of them, and then flice them, and put oyle and vinegar to them, and some a little falt, or as others please sugar, and some spice, and so eate them cold: others put butter, fugar and spice, and so cate them hot: or boyle them in milke or creame, or fat broth, others againe flice them and ftrow fine flower on them, and then fry them with butter, fuet, or oyle, and so eate them : Clusius faith that they use in Germany to hang them in strings, and keepe them dry, or thers falt them and so keepe them untill winter, (for the best grow up and are gathered in the spring, and not in the Summer or Autumne yet it is observed that they grow most in a rainy scalon, and often after thunder) and then dresse and eate them. I have beene the longer in the natration hereof, to fave the often renetition of one and the same thing in the rest, as also that

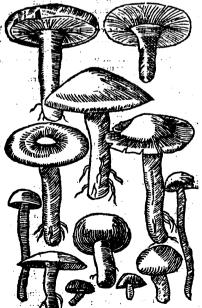

Mushromes are called in Greeke unxine, in Latine Fungue, by the Arabians Hater and Father. The Italians Fonghi, the Spaniards Hongos, Cogomelos, and Cilberguas, the French Campignous, Porrious, and Mon-cerous, the Germanes properly Schwem, and perticularly Heyderling, and the Datch Campernoelen Pfifferling.

the difference in others from this may bee the better

knowne and discerned.

1. Some of this kinde grow bigger then others, and some more topped or spiring, and some are par-ted as it were all over into sundry divisions, making it feeme like unto an hony combe, and therefore are called Favagines, but are not dangerous as Gerard faith, for Classic pattern it as one of his principall or first kindes of edible Mushromes and faith it seemeth to be that which Daloshampian calleth Spongiofun, and

Fungi efculenti varif. Divers forts of edible Mufhromes.

the Italians spongiola, and the Fronth Morilles, because the head doth well resemble a Mulberry, and Camerarino fish are called Marchell by the Germanes, who be much delighted with them.

2. Another kinde is more sharpe and spiring, then in any of the rest of the edible kindes, and small withall.

2. Another whose outside is of a whitish browne colour, is more steeple fashioned and bigger, and is therefor alled pramidalis, and are as good as any of the former, being the greatest of the fourth fort of Clasius his e-

4. Another fore is round, somewhat soft and whitish, having a slit on the edges most usually, and are called St. Ginger Mushromes, because they grow up chiefly about that time: this is the third kinde of edible Mushromes

f. Another is cornered either more or leffe and fome jagged about the edges, having longer and shorter stalkes, and some of them fuller or lancker then others, which are often found under Elmes, and white Popler trees, and herefore called Fungus Populneus : yet Cafalpinus faith that at Turin, those that grow under the Poplar trees at milliked, which thing proveth my former affertion that the ayre and foyle bettereth many of these kindes.

6. There is a kinde of Mushrome called by the Grecians in former times πεξιωί and πεζιωί, and by Pliny Pezice

b. There is a kinde of manifecture tanger by the Greetans in for the doe grow out of the folid ground, wherethe the same of the called Cup Mushromes in English. For they doe grow out of the folid ground, wherethe they abere fo throngly, that hardly without breaking they can be got up. Sticking to the earth by certaines
fall sticking to the earth by certaines
f witness within the hollownesse, three or source onness of raine water, especially the greater of them, which by mion of the thicke skinny or fleshy fabitance thereof corrupteth not, nor the water therein referred for a long incbeing white on the outlide and reddish within, and are found growing in the fieldes of Haly in divers places by the path wales as Columns faith, and certainely determineth them to be the true Pezica of the ancients and Plimelfe differing in sindlance, and are thought to be none of the permittions forts, because they are not most or gluminus in handling, and doe not rot but endure a long time, and become wholly dry.

Definess tooke the Fusse

buls to be it, but erromiously. 7. Another fore is somewhat flat on the head, a little turned in like a Navell, and are of an unequal sife, being nowaish greenish or vellowish coated, whereof the largest is called the Frowes Mushrome, and the first of the thirtcenth fort with Claffe.

8. Another likewife not to flat throughout, but round in the body, and fometimes torne on the edges, of a pale nowne colour, and spotted with white: this is called tuberofus fungus.

9. There is another called by Gordus Boleti, and by others Funginemorum, which is almost round and white, found with yellowish browne markes some of them bigger then others, those growing under Beech trees are teller then others, whereof fome are choile in cating them, rather taking the pale then the redder.

10. Another is called Capeelini, differing not much from fome of the laft, but in being yellower above, and

howner undermeath, being the twelfth with Classus.

It. Acother fort groweth in woods about the beginning of Summer, and for their rednesse above are called red Mathrones, although both the fightrand the under part be not fo full of stripes.

12 A twelfth fort Trages called valgares Amenica vel Boleti, and are called the most common also by Lobel

Another fort being round and a little flat above, are all hairy, and of a blush colour, and are therefore called while or birfuti cervini Pangi; and some of them will be blackish also, some also will grow two together.

14. Another is leffe hairy, but otherwife much like the laft, whereof some are mixed with white, pale, and howne, and some are smootty withall, with many blackish purple lines underneath, and are called Firre Mushones, because they alwaiss grow in the Firre tree woods.

15. There is another which is called the Goates hoofe, because it is cut in on the edges into fuch parts, that it my well refembleth it, being browne above, and white underneath, and more torne on the edges when it grow-

thold, then while it is young and new forung up.

16. Another fort hash the stalke sometimes bigger in the lower part, then the upper bole is, and is much discoband with blew, greene, and browns, or in some yellowish, the upper part of the bole being browne, and withex my lines underneath. Cinfons thinketh that this fore commeth neetell unto the Amanica of Paulin Aginera. Vunun

17, There

6. Fungi Pezica.

22. Fragus Dipfactides.
Teafell Muhrome.

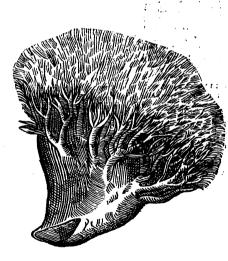

27. Fungus terreffri Digitatus dillus. Finger formed Mushromes.

17. There are two other forts of so delicate a taste that they are eaten raw, the one is flat at the head, and of a reddish colour, giving a sweete milke when it is broken, and is the fixth fort of Trague, the other is great, while and round, smelling very sweete and called Richione, as Baptista Porta fath, that is, the King of Mushromes, and for the pleasant taste may be given to the sicke without danger.

18. Then there is one which Colorbana calleth Lingua, growing on the bodies of Chefinutirees, whose stalls is not so that true Bolesua, and the head is somewhat red.

19. And then there is the true Rolesua, and the head is somewhat red.

19. And then there is the true Bolesm of the ancients, which usef so delicate a taste, that they that are accomed to the feeding on Mushyomes, delire them more then any and can never be fatisfied with them, which Classified found to his cost, being killed with them; they are as white as an egge; and of the same sorme who

30. Tubera terre edibitato Tubera cervina. Vnderground edible Mushromes.
or Spanish Trubben and underground Deeres balles or Mushromes.

they first spring up, but after two or three dayes the white skinne or coate breaketh above and sheweth yellow, like the yolke of an egge, which then groweth greater, and into the forme of a Mushrome (the white skinne saling away by little and little) being ray sed somewhat higher in the middle, and of so gold a yellow colour, that it seemeth deeper coloured, then the saffron it selfe, and lesse yellow underneath, with as many lines as in other such ones, the stake likewise is yellow and an inch thicke, when it groweth old it breake the into three or some part, and looseth the fresh colour above, becomming more pale, and underneath almost white: these being dreshand street as a distinct or the table where Clussus was, seemed unto him to be coloured with Saffron.

10. There is some that are called *Porcini* or Smilli, Swines Mushromes, which are somewhat pointed, and of a smokic colour, spotted with white spots, and underneath with blackish lines, the upper part in some will be red, buccelapinus faith that those which were called smill or porcini with them, were of a brownish yellow above, and of an ash colour underneath.

11. Then are there fuch which those of Naples call Conocielle, as Baptifta Porta faith, and peradventure may be the Chalpinus faith were called Secretia, growing in medowes, the head being broad, and the stake very beg and of divers colours, this with Cinston is his eighteenth.

12, Another fort is called Quercisus diplacoides by Columna. The head hereof is white, and like unto the ording for for forme, but that the toppe is browne, and groweth to be sported, but the chiefest matter of difference in the stalke, which hath about the middle of it, or higher, a certaine hollow dish, like as the Teasell seemeth to bre, being rough and browne, about the brimmes: the lower part of the stalke is as it were knobbed, and black-hear to the ground, with some hairy sibres thereat: it groweth among Oakes, this may be called the Teasell

13. There is another that groweth on the Larchetree, besides the Agaricke, which is of an large site, containing thirty pound in weight as Masthiolus saith, and is of a gold yellow colour, somewhat torne about the edges, and is not pleasant,

mass most picasant,
24. Then is there snother called acris or piperisis, and peradventure may be that which Cordus on Diofcorides
alleth Piperio Superas being a white Mushrome, and tasting sharpe and hot like pepper.

15. There is another fort which Cefalpinus faith the vulgar people called Frankli, being very small of an ash

16. Another is branched and is the nineteenth with Classes, being in some yellow, in others reddish, and in others is branched and is the nineteenth with Classes, being in some yellow, in others reddish, and in others is pale white, which they call the Goates bearde, and adde their colour, the most conspicuous is that which is yellow and spotted with white spots, Classes saith that these are some what like those Mushromes that Baptista line saith, were brought from mount Garganus, like young Asparagus buds, and then breaking out into branches.

27. There are two other fores called Digitatus major & minor, and Digitaliby the Italians being of a large fife, adputed as it were into long white fingers, one whereof will suffice a man at a meale.

18. Then is there a monthrous great kinde growing in Hungary, being of two foote in breadth, having many 18. Then is there a monthrous great kinde growing in Hungary, being of two foote in breadth, having many lagetome leaves like scales lying upon it and fashioned like an Oaken leafe, some of them of a darke red, and hand-fore of ablackish white colour, with many blacke spots in the white, the stalke a foote high, and an hand-fore of ablackish white colour, with many blacke spots in the white, the stalke is halfe a foote high, and a hand-had a halfe in thickeness C. C. husen thinketh this to be that mushriome which Bapisish Porta saith the Newson all Gallissois, being of so large a site that ir doth weigh someteore pound, and that one will satisfie a surface and the surface of the surface

In fernein Hungary those that have beene so great, that one might well fusfice foure men at a meale.

19. There is also one that is very small and a little long, formed like unro a tooth, and therefore called Den-

30. There is yet another kinde of mushrome (for so it may most fitly be termed, and not rootes, as some would whichem to be) that groweth not out or above the ground, as all the former forts doe, but within or under the appropriate thereof, called in Greeke either 50 yer and 5 ra ab imbribus, or 5 of yer ab bimore, in Latine Tuber and Tuber arbor) in the Arabian tongue Ramech Alchamech, Tumer & Tuber of Tuber a terre to distinguish it from Tuber arbor) in the Arabian tongue Ramech Truffes, in the Germane.

Kana, in Italian Tartuffe and Tartufole, in Spanish Turman de tierra, in French Truffes and Truffles, in the Germane.

CHAP. LXIV.

Fungi permitiofi. Dangerous Mushromes.

He other kind of Mushromes as I told you are dangerous, if not poysonous, whereof there are many forts which Clustum hath amply set down in a treatise concerning them, and Bankinsss after him hath added more out of other Authours, which because they are too numerous, and to little purpose, either for me to write, or for you to read or know, seeing neither the one halfe of them are found growing with us, nor doe we neede caution to beware of the bad, seeing our Nation is not so enclined to the good, I hake I may well spare my palnes from recounting all the severall varieties that they doe, and onely mention

fone of the most speciall with the Touchwoods, and fone exotickes, and so end this Classia.

in the first groweth under Plumme trees in the beginning of the yeare of differing former, and greatnesse,
for some grow many together from one roote, as it
were, with very little or no stalke at all, yet some are
round fashioned, others are cornered, some are larger
and smaller then others, all of them being mixt with
white, pale yellowish and browne together.

2. Another because it groweth among dung is called Finiterist, and is of a round flatnesse, formewhat thinne white, and covered as it were with meale all over, harmgbrowne lines underneath.

3. Another groweth under Hazell nut trees, which are sometimes of a whitish red, and as it were smoaked over round and somewhat broad.

4. Another of a reddish Corall like colour, full of road yellowish spots above, and pale yellow undergath, full of blackish lines found in Wales.

5. Another is called the Toades Mushrome, being of a wan colour, and round like an helmet, or more yellowish but smooky, or else more flat and reddish with some some.

6. Another is very small and round not exceeding the nile of ones singer reddish above and very hollow undeneith this is called the Goates Mushrome.

7. Another is somewhat like the true Boletus, but is

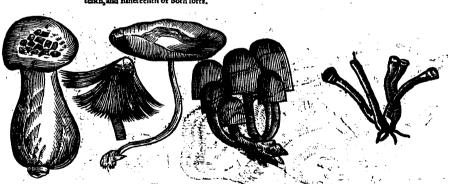

Fungi lethales, 9, 10.19. Deadly Mushromes, the ninth, tenth, and nineteenth of both forts.

8. Funga Mufcarine,

Flye bane Mushrome.

Mufem parvus denticulaint.

thur halfe an inch broad, spiring a little at the toppe, and being of a which colour, with a long stalke, of the beesse of ones little singer a this is called the foolish or the fooles Mushrome.

8. There are two or three other forts, that are faid to kill as many flies as fit and feede on them, as well when they are fry as fresh, fome of them being greater and broader then others, and fome much redder, and spotted with white spots all of them doe grow in the woods that have beene feld.

9. In the like woods are found other forts about August, one whose stalke is bigger below then above, and the based toppe round and pale whitish, but no bigger then the bottome of the stalke.

10. Another fort is much frequent with us, and is of a blackish colour much rent or torne on the edges, and

buging lanke about a finall long stalke.

11. There is another kinde which is Classian his nigeteenth, and is of divers forts, which because they are so like amosome of the edible forts, deceive many that gather them, and are often a speedy death to them that east them, whereof some are reasonable small, others very large, and most of them of some beautifull aspect, either whitish

tongue Hirrz brunst, in Engliss some call them Spaniss Fassels, because they are somewhat like our Fassels which are not edible, but containe a smooky dust or pouther in them; but I would rather call them Vader grenned Mushromes, or Spaniss Trubbes to distinguish them. Matthishus saith there are three forts of them, (Pliny mentioneth two serts, one whereof is gritty betweene the treeth, and are some bigger then a Quince, and some of a pound in weight, and saith, that hee knew in his time Marini Leaning a Prater and Iudge at Carthage in Spains, that bowed a penny betweene his teeth, that was in that his of the Tuber that he did eate, whereby is manifest that the earth did gather it within it of it own nature, being a thing not to be planted) one whose inner pulpe or substance is white, another more browne, yet the barke some rinde of both is blacke and full of rists or chaps, a third fort that groweth in the coast of Annie and Trans is less, the barke smooth and more browne, and less pleasant in taste or instipled. They grow as I said under the superices of the earth, yet not cleaving thereto, causting it sometimes to swell, and sometimes to rist and cleave, where by it is discerned where they grow (yet Pliny faith the contrary, and that they have no seede, which will present by it is discerned where they grow (yet Pliny faith the contrary, and that they have no seede of the Cyprest tree, whereby it not ouely propagateth it selfe, where it is naturall, but as it hath been often observed, there have some evident in them saith Salen it selfe, where it is naturall, but as it hath been often observed, there have some evident in them saith Salen it have beene cast. For the qualitie or property of them, they have none evident in them saith Salen it has a November soude, and that they that eate much of them are subject to the Appoplexy, and Palsie, and besides are hard of digestion, and trouble the stomack, whether they be rosted under embers or otherwise boiled in broth, and eaten with pepper, oyle, and vinegar: Vnto

Lugdenesses faith that Angeonus sent two sorts of plants out of Spaine, which the Spaniards in Casile call Terus termers (and is the Cissum annum, as I showed you before.) that is Tuberaria, which peradventure may be it, for

they suppose where they doe grow the Tubera doe breede.

31. Tubera cervina. The Deares underground balles or Mushromes are another fort of these Tuberaes (where of Matthiolus sirst maketh mention in his third booke of Epistles, and the last thereof, and after him Lobelinhia Tutch Herball, growing underground, in the woods of Bohemia, &c. where Deare doe much haunt, especially where they couple as the former do(and thought to grow of their sperme that falleth on the ground, and is but the opinion of hunters and Country people, whose judgement in so secret a peece of naturall Philosophy, is not to readily to be admitted) which are like them, being alwayes round, but uneven or rugged, whose outer skinnes blackish, and the inner pulpe or substance whitish: these be not eaten in the same manner as the former, that is for meater or food, but as a medicament being cut into peeces, and dryed upon strings put through them, to be seed either alone one dramme and a halfe in pouther, taken with sweete wine, or with such other things as provide venery, as also to increase milke in Nourses breatts, taken in some prisane drinke, and a little long pepperadded thereto; the smoake thereof when it is burned taken underneath, helpeth women troubled with the mother, and openeth the passages when they are closes they are thought also to expell poyson, and the venome of creature, so be taken in pure wine, and also applyed outwardly. I much mervaile that Clussum having seene and set down so many forts of Mushromes, remembred none of these, but I presume that if he had not hope of overground good, he sought not for underground treasure.

Vinto these Mushromes may also be adjoyined those which are made by art, whereof Masthiolis maketh mention, that grow naturally among certaine stones in Naples, and that the stones being digged up and carryed to Rea, and other places, where they set them in their wine cellars, covering them with a little earth, and sprinkling aline warme water thereon, would within soure dayes produce Mushromes fit to be eaten at what time one will, as also that Mushromes may be made to grow at the soote of the white Poplar tree, within soure dayes after warme water wherein some leaves have beene dissolved, shall be powred into the roote, which must be slir, and the stocke

above ground.

To cause that the edible Mushromes may be lesse offensive, in that many doe too greedily desire them it is bely that it they be boyled with wilde peares, they may be eaten without danger, or for want of wilde ones to take harder or has ther fort of other peares, the leaves also and barke are conducing to that purpose, and so is raw Gar-

licke taken with Vinegar.

32. And lastly there is the Iewes eare, called Fungus Sambueiaus. (which I place among the edible forts, and not among the venemous, as Clusus and others doe, because atthough it be not eaten in the substance as other are, (and yet Baptisha Porta nameth one Sambueiaus optimus omnisms,) yet the broth is used after the boyling, as I hall show you by and by) which groweth on the Elder trees that are planted on Cony. boroughes, for their shadow and shelter, and not so frequently on them in other places, being as all know soft and limber, while they are fresh, not very thicke but transparent, and of a blackish colour, of differing formers and see, for the thinne on the edge, and thicke in the middle, and some two or three growing together, all of them being dryed become of a blackish gray colour, and then may be kept a whole years or more, safe without spoyling to benefast you neede, for lotions for sore mouthes and throates, or when they are swolle, to be boyled in milke, or skeped as vinegar and so gargled, which is the onely use they are put unto that I know.

whitish or reddish, or more red and smoaked over.

12. Another fort growing under the Firetrees, that is to like unto them that grow there likewite and may be eaten, that they know no other difference but that these are hairy underneath, for which cause they are refused.

14. There is a kinde which is called Phalles Hollandiens by Hadrianns Innins, and may bee called the Hollanders working toole, which at the first riving up of it, is fomewhat round, but the skinne breaking, there rifeth up a ftalke of the thickenefic of ones thumbe, and of a fingers length, fomewhat like a dogges pricke, having a nut or cappe on the toppe, an inch thicke, of a blackish greene colour at the first, and after blacker, with certaine celles or hollow places in it : the lower part or purfe from whence the stalke rifeth, is of an ashcolour, and sometimes brownish, the stalke at the first is white, but afterwards of divers colours, and spotted, this fort stinkerth at the best, but withering is turned into a moist blacknesse, colouring the very ground whereon it falleth : Flies are killed that fit and feede hereon, this is Clustin his description of the fifth fort, of his three and twentieth kinde, which as hee faith doth come neere unto that which Hadrianus Immus reporteth to be much found on the Flollanders fundry Sea thores, and also though their figures be somewhat differing one from an-

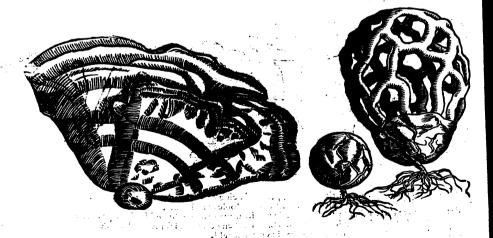

ther, yet furely they both expresses but one thing.

14. On some Cherry trees that begin to putrelie, sometimes groweth a kinde, rising many together, laid statone upon another, about an inch or more broad below, and fpreading to bee three or foure inches above, and about halfe a foote high, being of divers colours at the toppes, the edges being of a deep red colour, with a mealy white lift about: the lower part for an inches breadth upwards is pale whitish, up higher being yellow and red mixed to-

14. Fungue imbrication dispositus versicolor. The foulded changeable Mushrome.

20. Fungus Caralloides careculatus Clufi fore Lupi ereptius e florefeens Columne. A deadly ftinking Mu throme, though finely branched.

gether, crofting it athwart, then yellow ith, and above it red and yellow mixed againe, and then yellow to the very edge, but spotted with divers smoothly spots and pale of yellowith underneath. This although it be deadly to menyet is given cartle with their fooder, dryed and made into pout her fately.

25. Then is there another larger round & which one as his of black lines from the center to the circumference above and below but that those above are greater, and not fraudit as those below and a little waved, the adge allo being finely dented about.

16. Another being finely dented about.

24. Fungus fruticofus argenteus.
1 he branched falver Mushrome.

26. Fungus durus arborum five Igniarius. Touchwood.

27. Fungus lapideus. A ftone Mushrome.

3 2. Lupi crepitus five Fungus ovains. Fusie Balls.

16. Another little one hath beene found about Hackney, dented in the like manner, about the edges, and of

Nacke chefinit colour, but not striped above.
17. Some grow on the rotten boordes and timber that lye or are set into the earth, being small and like a greene

figge, having small seed within it, which was sent unto Clusius to try his skill.

18. And some are round like a Fusseball, being of a brownish colour, above and darke red underneath, which when they are broken are of a blewish greene colour.

19. Some others are like brimlesse hats, many growing together and some broade like shields, their brimmes

20. And there is another which Columna calleth Lupi crepium, and with Cinfum Cancellatus, which hath a fault firingle roote, differing from all others, and a round white Fungus at the first, which afterwards breaking opendivers reddish branches doe arise out thereof, which doe all joyne together, making round arches of hollow need barres, or lattesses as it were, seperated one from the other, this hath a very stinking savour, whereof comments the name, and is much devoured by sives that eate it.

21. Those Mushromes likewise that grow upon the stockes or bodies of trees or their armes, or at the rootes of those that are rooting or dead, or upon dry boards are very diverse also, yet are none of them of the hardnesse aftention of the whereof are like unto Iewes eares, either whitish or yellowish, crumpled and of a skinnic substance like them.

22. Others grow on Birch trees Willowes Cherry trees, divers growing one upon another of very variable and delightfull colours, which as Clasius faith the Country people use to keepe dry, and although it be deadly to man, yet as they thinke it helpath their cattle when they are sicke, being broken small and given them with a little sit in their fooder.

23. Some grow like ordinary Mushromes, very many together, on severall stalkes, differing in brownesse, whitenesse, and rednesse, one from another, either on the dead rotten bodies or on the armes of trees.

24. And some that grow like a furubbe with many branches, and are of so pure a whitenesse that they seeme

as if they were made of pure filver, if they were shining withall, this hath oftentimes no stalke, or but of halfe an inch long, and groweth on the rotting bodies of trees, that lye upon the ground.

an inch long, and groweth on the rotting boules of these, time type around growing in Kent, in fundry places, as at Ripton neere Affind, on Bromley greene also, and at a place in Rumney Marsh called Warkorne, the talke whereof is like unto other Mulh. Bromley greene alfo, and at a piace in Animos, and its sales of a faint yellowish colour, and may be called Fasque to the head is made of scales, like unto an Artichocke of a faint yellowish colour, and may be called Fasque Cinara forma Artichoke Mushromes.

Tinare forme Artichoke Mulhromes.

26. The Touchwoods are likewise side kindes of Mushromes which grow harder than the others, and are of aday. 26. The Touchwoods are incevine anness or maintenance by the track of the state of fungous or spungie substance on the insue, that may be dut of one being very great, and flat at the head, and smaller and rounder underneath, of a brownish yellow colour, and such be they which Lobel compareth to age. finaller and rounder underneatts, or a blowning years with wood after, and being afterwards dryed, are kepebroken ricke, and are once or twice boyled in lye, made with wood after, and being afterwards dryed, are kepebroken into peeces, ferving to take fire like lint.

27. And lattly there are tome of a frony liabstance, whereof fome are of a round forme, very necre unto an ordinary Mustrome, being of a grayish blacke colour, full of white lines and strakes, on the upper side, embow. ing a little from the middle to the edge, and with many lines likewife underneath, but not paffing above halfe way from the edge to the middle.

28. And another greater than it, whose diameter is about three inches and a halfe all whitish, and full of deepe 28. And another greater than it, whose statuster to the circumference, where it is finely dented like a faw, the underpart is also full of rough lines, but shallower, browner, and variously bending.

29. Another is somewhat long with the roundnesse, and hollow in the middle, the edges being cut in halfe

way almost, and forming round ends like unto some flower, descending thence smaller unto the stalke.

way almost, and forming round ends like unto foliable tower, determing tends in matter unto the talke,

30. Another is like unto Agaricke found in hollow places of the hills in Helvetia and called by Gefuer Agaricus
faxatili vel Fungus petreus, and by the Country people Las Luna, whose substance is white and froshy,

31. Another is half a foote long and two inches broad, channelled or guttered, and semewhat rough on the

upper part, and full of strakes underneath, running two wayes a crosse the whole, being in forme like unto neates tongues

22. The Fusse balls or rather Foilt or Fist balls, taken from the Germaine word Fist quod crepitum significat, called 32. The Pulse Dates of Talker and Project and Indiana, and Lucernarum fungi of fome (and taken by Dedoness to be the Pexica Plinis, as I sayd before, but Columns hath first fet forth the true fort of it, whereof I gave you the figure the Pexica Plinii, as I sayd before, but Commune hath first set forth the true fort of it, whereof I gave you the figure before) but without reason, the Lucernanius fangi, being the small peeces of the Weeke or Cotten, that lyeth in the Oyle in Lampes that sticking forth, trouble the burning thereof, which assured by those Particle tenter fungos in the Lampes, as singuested in his first of Georgickes doe expresse and not these Fusile balls although Gerard would so interre it, because indivers Countries of this Land they rise to carry five in them from their houses, distant a good way in funder? They are of severall fixes, some of the bignesse of a ball or balloone or a childes head more or lesse, tound smooth and wistish at their first rising, but growing in time to be of a dukic colour, cracking in sundry places of the constide, and growing on the ground most usually in the dryet siciles, and seldome in the moyster (which while they are young and white, as Chassas sinh, he and others of his schoole fellowes, being children, would in sport throw one at another) conteining within that outer skinne certaine dust or powder, which if by the breaking or treading on should she up into the eyes, would roable them shrewdly, if not goe neere to blind them; yet serve to many good uses, Country Chirurgions using often to string up the skinness of them, to serve them to Standen heeding in wounds or otherwise, and the Country people with the powder doe dry up kibed heeles, and the freeting of the skinne in any place of the bodie, as also toold fire as I sayd before, and with the smooth of them being set on fire to drive as they call it their swames of fire as I fayd before, and with the smoake of them being set on fire to drive as they call it their swarmes of Bees.

Thus have I shewed you all the kindes and forts of these Mushromes, both wholsome and dangerous that who loever is addicted to the delight of them, may take heede in time upon this admonition, that although many may be found of a pleasant and delightfull shew in our owne Country as well as in others, yet the daneer is so great yea of the best, that many upon surfets by over eating of them have dyed remedilesse, and therefore itis not good to licke your honey from fuch thornes.

High section is a subdifference

MISCE-

NORDERED TRIBE.

CLASSIS DECIMAQVINTA. THE FIFTEENTH TRIBE.

CHAP. I.

TRIBE 15.

I this Tribe as in a gathering Campe I must take up all those straglers, that have either loft their rankes, or were not placed in some of the foregoing orders that so I may preserve them from loss, and apply them to some convenient service for the worke.

Gramen Deucanthemum, Stichwort. Although Stichwort is called *Gramen*, yet it much differeth informe much different interest from them, and there-

fore not fit to have beene there infe. .ed, whereof there are two principall forts, a greater and a leffer tran earlier, and later, but in each of them there are also some small diversiries, as thall be presently fhewed.

1. Gramen Leucauthmann majus. The greater Stichwort.

The greater Stichwort bath fundry round flenderstalkes, rising from the roote, fearst able to sahine themselves, but by the helps of the hedges of other things that grow meere it, being full of joynt, with two small leng hard rough and pointed the same of them, at the toppes whereof had may small slowers, composed of white leves, standing like a starre, with some white threads in the middle; the roote runningly or tree-peth in the ground all about, with franky small from thereat. Of this fort shere hath because some varieties observed, partly in the stalkes and leaves being in some higher or greater than others, and in the flowers likewise, being larger or lesser, and in the threads in the middle, some being paler or telder than others. derflakes, riling from the roote, fearle able to telder than others.

2. Gramen Lencanthalium majar. The leffer Scienwort.

This leffer groweth like unto the former, and different onely in being leffer, the leaves had been divised the leaves for the lefter. and the flowers (maller, whereof each leafe divided as it were into two, maketh it freme to have

Varietas:

1326

KIBE 15.

Incega tum

more leaves then the former, the feede of them both is small and somewhat like unto Linseede contained in robal

buttons.

This also is found to have some diversity both in the stalls growing more apright, or else lying upon the ground, and also in the flowers, some having the white threels in the middle ripe with blacke, that it maketh the whole flawer feeme to be blacke or elfe with pale yellow.

The Place and Time. The first fort groweth more usually under hedges, and apon dry banker of directes or the like, and flowrech a moneth earlier then the other, that is in April, the other is more common the fields of Corne, and elsewherein

the more open and champion grounds, and flow reth not petill May or Jane,

The Names. Tragus calleth it Eufrafia gramen, and Lonicerm Enfrafia major, Camerarine Gramen floridum. Matthielm Gra Trague calleth it Eufrafia gramen, and Lonicerm Enjragen major, Connect and Lobel call it Helefium Redly, men alterum, Fuchfius, Dodonesse and others, Gramen Loncanbemusms, Dodonesse and Lobel call it Helefium Redly, who took it to be the Holofium of Diofeorides, Dodonem also referreth it to the (rateogenem of Diofeorides, which who took it to be the Hologium of Diojectua, Douonam and lettered in the arrenge glader fore major of mine faith was also called Melampyrum. Bambinus calleth them both Caryophyllas arvenge, glader fore major of mine rie, but why he should referre them to the Caryophylla I see little reason. I would thinke they should better agree ri, but why he inould referre them to the Carpepant I to the Dutch Ooghen troof grau, and we in Englifb Stichwort.

The Vertues! It is much commended by fome to cleere the eyes of dimnesse, or filmes that beginne to grow ever the fight. to drop some of the juice into them. It is no lesse accounted of to helpe stitches in the sides, to drinke the pourher thereof with white wine. Other properties this is faid to hold, but they are onely taken from Dieferides his Hotofteum, which whether this be it, is much doubted, and therefore, the properties, whereof one is that Disferrides faith it is sharpe, is not found in this herbe.

CHAP, II.

Melampyrum co- Crataogonon. Blacke Wheate, and Cow Wheate.

Hele two names although they feeme to be different, yet are the plants referred unto them, noth much differing one from another, but that I may joyne them both in one Chapter, their varieties to be explained are as followeth.

1. Crateogonum vulgare. The common Cow where: This that is most frequent in our Land, bath an hairy squarestalke, branched almost from the bec-

1. Crateogonum vulgare.
The common Covy Wheate.

2. Creteograms fore verie,
Another party coloured Cow Wheate.

while a yardhigh or more very weake and flender, and fuby he bushes among which it groweth, having two long amph leaves fet at each joyat, broadest next to the stalke, pointed at the end, somewhat rough alto on the underfide, if the money and the conductive of the training of t interior serviced, two flowers onely itanding at a joyne in the like leaves fet with chem, but shorter and smaller, the mine like leaves let with chem jour morrer and imaller, the large are long round and hollow, gaping open at the end, and long looking all one way, of a pale yellow rolour, and white the party but grow yellower in time, yet in fome of a blewith. phih colour sitter deeper or paler, each flanding in a fmall metable, wherein afterwards grow round cups or veffels, maining browniff feede not much unlike to wheaterthe roote impored of inall threas: I give you here the figure of ano-ir fortofulis Cow Wheater which I found among Doctor wy neare): which I found among Doctor. Languers, without description, and therefore can frame none

2. Crateogonum flore vario. Another party coloured Cow Wheate. Thanhe groweth like the former, but the ftalk is more reddifh. more finely dented upwards, where in folker or tuft's of flowers are of a reddift or blush colour, bebe they freade open, and then thew the flowers to be yellow. bout the mouth or gaping place, and the reft purplish red.

3. Craizogenum incognisum.

4. Melampyrum. Blacke Wheate.

Melampyram per pafillum lateum.

Crateogonon luteum angustifolium.

Yellow narrow leafed Cow Wheate. This differeth little from the former, but that the stalkes being red, the leaves are longand narrow, like unto Linaria or Tode-flaxe, without any cut or dent at the edges, the flowers are long gaping and hollow, of a pale yellow colour, Itanding in a long spike and looking for-

4. Melampyrum. Blacke Wheate.

This in the forme being to like the rest, sheweth that it is of the fame family, for but that it groweth greater in the Corne fields, where it most delighteth, and the leaves be short and natrow, fet on the stakes and branches which are many and having other smaller leaves comming forth at the joynt likewise, the spiked head of flowers opening not so much, but abiding closer, in some wholly reddish both the likewise, the spiked head of flowers epening not to the transport and yellower above, or mixed with white yellow and below, and white in the middle, in others reddish below, and yellower above, or mixed with white yellow and greene amongst, you may fay it is the same, with these onely differences.

and greene amongst, you may say it is the same, with these ones, you may say it is the same, with these of Provence in France, riseth not above two inches of Provence in France, riseth not above two inches of Browners, which was above two inches of Browners in the fields. This small plant growing among the contest.

This small plant growing among the chief, with flender small narrow leaves, deepely cut in on the fides, like unto Harts horne, the heads being does. and the flowers yellow somewhat refembling the forme of Alepseures, the Foxetaile. 6. Melampyrum launginofum. Woolly blacke Wheate.

This woolly Wheate hath a foure hoary or woolly stalke a foote long, branching forth from the roote will two long and narrow woolly leaves fer at every joynt, finely dented on the edges, much like unto those of the two long and narrow woonly leaves let at the last party and the faller and branches are feet long spiked heads, soft and woolly, with long flowers breaking out of them like the others, but spreading a little broader. The Place and Time.

The first as I said groweth among bushes and brakes and the like, upon barren heathes, as at Hampfood, nicro London, and many other places of this Land, but I have not head that any of the rest have beene found with as, but in Austria and Germany, the fifth in France, and the last in Spaine, and doe flower most of the Summer, the seeder; pening foone after.

The Names. Kegrinoperor. Cratzogonum is remembred by Diofcorides, id enimeror store neutrin dicitar, but of, femon robore acure. Regrauopto, Crateogramm is termethology of the first frateogramm, baththe like leaves to Malampyrum and that Myagrum was called also Melampyrum, but Theophrasius in his eighth Booke and sith Chapter, mentioneth Melampyrum to grow among corne, and which in comparison of Lessand Darnell, that troubleth the braine, he calleth res innocens, a harmeleffe thing. Galen hath it prime alimenteram altime, to grow from dego nerated Wheare, and some thinke that the Stelophuros of Pling lib. 2.5. 6,17.18 it, and as some thinke it is his Ale cures also, but rightly in neither, as it is likely, Ban binus also thinketh it may be Aera of Theophrassas, whichin generally taken to be Lolium but it cannot be his Aera, because he nameth them both in one Chapter, and come. reth them together: Most men now adayes call it Triticum vaccinum or bevinum. Bankinus maketh all these to be Melampyra, not allowing any one diffinctly to be called Crategonum but as others doe to call them. Classes. in following an ancient error among the Germanes, whereas Tragus first as it is likely remembreth it, calleth them Parietaria (ylvefiria, which he faith himfelfe he knoweth no reason or cause why it should be so called. The fifth Parietaria fivefiria, which he iath himlete le knoweth no teach to the way in inductive to caned. The inference is the Parietaria fivefiria feenada of Clusius, called Cratasgonum by Lobel and others, Lugdannis tashir both by the name of Satureia Intea Dalechampy in one place, and by Hypsons. memorings laws in another. Takemontanus calleth it Milium fylvaticum, and Thalins and Banbinus Melampyrum. The second is Clusius his third Parietaria fylvestru, and called Triticum vaccinum by Tragues, Dodoneus and Lugdannings, and Melampyrum by Castaria fylvestru, and called Triticum vaccinum by Tragues, Dodoneus and Lugdannings, and Melampyrum by Castaria fylvestru. Tractaria y to firm, and cancel I rithm the Melampyrum of Thalins all is likely, and the angustificium, or lution Linaries folio of Bankinus. The fourth is the Melampyrum of Lobal, and the fust Paristaria strice of Classes. The fifth is called so by Lobal as it is in the title. And the last is called Paristaria mentana Batica by Clusius in his Cure posteriores, which Baubinus calleth Melampyrum languaglam Beitagns. The French call them Ble devale, and ble de beuf, the Germanes Kuweisen, and brawn ffeifel blumen, the Dusch Poorts bloomen, and wee in English Cow wheate, and Melampyrum, Blacke wheate generally, forme authorie, account them degeneration of where and Ryc, others take them to be the faults of the Corne when as they are with them as well as with as, no other then weedes, as Cockle, Blew bottles, and Cornerofe, which come where they are fewere as well out of the Corne The Vertues.

The Cow Wheates generally in all the places where they grow among Corne, if they be not weeded out, but fuffered untill the Corne is gashered, doe make the bread blacker then that which both it not as Trayw faith, and caufeth the like diffigues in the head and eyes that Darnell doth, as Lobel faith, we be bith the feede is a great incendiary to Venery, as Dieferidae and Pliny speaketh of it before, Galen faith that the feede of Crates manis fnarpe in tafte, and is used as Millet is.

CHAP. III.

Eufragia. Eyebright.

(Lthough formerly there hath beene but one fort of Eyebright knowne, yet these later times have found out divers herbes that for their likenesse thereunto they have entituled by the same name with their diverfities as shall be shewed together. . Eufragia valgarie. Common Eyebright.

The common Eyebright is a small low herbs, rising upusually but with one blackish greans stalks, a spame high, or not much more, spread from the bostome into sundry branches, whereon are set small and amost round yet pointed darke greene leaves, finely inipped about the edges, two alwayes ies together and very thicker at the joynts with the leaves from the middle up wards, come forth small white flowers striped with purple, and yellow spots and stripes, after which follow small round heads with very small seede therein, the toote is long small and threddy at the end, this is found on fome hills, to vary in the colour of the flower to be more whitish, yellow, or

2. Enfraçia minima. Small Eyebright.

This small Eyebright groweth not much above two inches high, having narrower and smaller ligaves thereon then the former, in all other things not differing from the former.

3. Enfraçia praesufts enformment. Great red Wooddy Eyebright.

This wooddy wilde kinde rifethup with one wooddy fquare brownift ftalke divided into fundry branches,

1.6. Eufragia purpurea latifolia: & pratenfis major luted.
The greater purple broad leafed, and yellow E .ebright.

3. Lufragia pratenfit tubra majer. Great red woodd, Lychright.

7: Eufragia litea radice fquantata Baubici, five Aneny ma radice Ventarie comme. The I fier yellon Eyebright.

Xxxxx

1330

little above the ground, that it feemeth a pretty bufh, about halfe a yard or two foote high, fet with fomewhat long and narrow leaves, pointed at the ends, and iomewhat endented about the edges, two always fet together at and narrow leaves, pointed at the ends, and some was transfer turne somewhat reddish: the flowers are groups joynt one against another, which will in the heater of Summer turne somewhat reddish: the flowers are groups and hooded, of colour purplish red, the roote is made of divers hard wooddy strings.

and hooded of colour purplish red, the roote is made of divers hard wooddy tryings.

**Enfragia praters: minor purpures. Small red wooddy Eyebright.

This smaller red Eyebright hath one square reddish heiry stalke, an handfull high, sometimes without branches and usually but with two seldome more branches, compassed with a sew shirty slamost round leaves, two together and deepely cut into parts, the lower leaves which are the safe that into three parts, the upper into five or sixe: the slowers breake forth, sometimes from between the sawes and the stalkes, and sometimes they find or fixe: the Howers breake forth, to include the hooded and purplish, commiting out of long greene hinkes, sometimes the flowers have beene observed to be white, but very seldome: a fixer which come long and cornered white feede in the faid huskes, the roote is small wooddy and blacke.

5. Enfragia purpurea latifolia. Broad leafed purple Eyebright.

This is somewhat like the last, but that it hath broader leaves, and the flowers are set by spaces up to the tops; of a finer purplish colour, in other things not much unlike the last.

This great yellow Eyebright hath a square hard reddish stalk enere two soote high, for with sewer Joyan, This great yellow Eyeoright nature industry in the day of the day of the edges a sewer Joynts, and longer narrower thicke leaves at them by couples, and but smally defined about the edges a sewer Joynts on and longer narrower smicke reaves at them by coapies, and like hoodes flowers, flanding thicke or close, two together, bending downewards and looking all one way, of a gallant gold yellow colours and flinding in long greene hystes having in them white feede like the former: the roote is mender and woods, the whole plant is

bitter and has sho me the tongue and astringent.

This lesser for hasha smooth hollow stalke a foote high or lesse, see with branches and leaves by comples on them, which are like unto the Germander, or Ivy leased Chickeweede but longer pointed, the sowers are yellow, but like unto those of the common Eyebright, the seede is small blacke and round, and pointed at the ends, standard and the seede is small blacke and round, and pointed at the ends, standard and the seede is small blacke and round, and pointed at the ends, standard and the seede is small blacke and round, and pointed at the ends, standard and the seede is small blacke and round. ding two together on a final footeflalke: the roote is white and round like a builder composed of four thicke coates or scales lying close together, the whole plant is without taste, and somewhat retainbleth Fumiterry, but Columna faith that the rootes are like the Dentaria major of Matthiolm, as the figure expecifeth it. The Place and Time.

The first and third are onely frequent in our Land, the former in many Meddowes and grassic places throughout our Country, and the other in many places of Kent, in the barron fields and waste grounds, both about Gravefend, and the tracts thereabouts, and in many other places, the rest some in Italy, and at Naples, or in Spaine and Africa. they all for the most part flower not untill the end of Summer, the feede ripening within a while after. The Names.

It is called Enfração and Enfração, and by some onely thought to be anciently called evectors, (yet is Enfortement) not knowne, nor described by any of the former Greeke or Latine writers,) for it is of later invention, and for the effects called Ophthalmica and Ocularia. The first is generally called Enfrosia and Enfragia, or Employie by all Writers. The second is called by Columna Enfragia linifolia, although the leaves bee sare less then those of Line or Flax: the third is the Enfragia altera of Dodonam, Lobel, and others, the Sideriti practice. rubra of Lugdanentis, the Odontites of Tabermontanus, the Ericoides rubram of Thalim, and the Crategonon Euphra (the of Gerard who would needes make it a kinde of Crategonon, against the saying of Dodoness, from whomhe Inne of Gerard, who would needes make it a kinde of Crateogonon, against the saying of Dodonem, from whombe hath the most that he hath, saying it cannot agree with Crateogonon, by the defect in many parts, and yet his Corrector doth so let it passe. The fourth Bankinin called in his Phytopinax. Brundla Italica, but in his Pinax Emphrasis pratensis Italica latifolia, and in his Proudromm Enfrasia purpowea minor, and is the third Enfrasia major sylvestric purpowea this of Columna. The sixth is the Sixthin re-tensis luca of Lugdanness. Fricoides lucamo of Thatin, Odontices sove luca of Tabermentanua, and the Enfrasia sylvestric major butea angustifolia of Columna. The last Columna calleth Amonyma radice Dentaria, and Bankina Euphrasia luca Alsonome a discount of Such Columna and yet Euphrasia. Germanes Augeneroft she Dutch Ooghen trooft and we Eyebright. The Vertues.

The bitter talte that is herein the weth it to be hot and dry, and is especially used for all the diseases of the eyes, that cause dimnesse of the fight, for either the greene herbe or the dry, the suice or the distilled water is very effectuall for the faid purpose, to be taken either inwardly in wine or in broth, or to be dropped into the eyes, and used for divers dayes together: Some also make a conserve of the flower to the fame effect. Any of these wayes used, it helpeth also a weake braine or memory, and reforeth them being decayed in a florit time. Arneldus & Villa nova, in his booke of wines, much commendeth the Wine made of Byebright, put into it when it is new made, and before it worke (which because we cannot make in our land, I could wish that the Eyebright might be tunned up with our strong Beere in the same manner, which no doubt would worke the like effects, their Wine and our Beere having a like working, as we nie with Wormswood, Serving and the like to helpe the dimneffe of the fight, and faith that the use thereof restored old mens fight, to read small Letters without spectacles, that could hardly read great ones with their spectacles before: as also did restore their fight that were blinde for a long time before. If this drinke be not to be made or had, the pouther of the dryed herbe either mixed with Sugar, a few Maces and Fermell feede, and drunke or eaten in broth, or the faid pouthers unde into an Electuary with Sugar, doth either way tend to the same effect.

Pelgele. Milkewott. simbivit. . . . is most

of this Milkewort belides that there is a greater and a letter kinde, and each of much variety in the colour of the flowers, there are found other plane then the much because ted of together. 1. Polygala major .. Tha greaten Milkewort.

This greater kinds (hooteth from the roote five as fire hand. Gender, and fexible falker, a force high or more, thicke fet with somewhat long and narrow leaves like those of Diers, weren the flowers grow high or more, thicke fet with lossewhat long and narrow leaves like those of Diers, werds, the flowers grow at the roppes in a long spike thiske rogether, forms what like so shode of Funniterry, but larger and of a fine delayed reddish purple colour and shiping, withall, after which follow flas notices, with two sectes inches ally, which are long blackish and hairy: the roots is herd and owneddy, with divers there thereis, and shides long. This bath beene found to vary, the colour of the flowers, affectedly in shadows, and most places, to be titler blew or white, or mixed at the smaller kinds is. The best of Mikkentons.

The lesser kinds groweth in all things like the former, but with lower and sentences that say, yet somewhat hard or wooddy not to many risks from some and the lower and the lower and the lower subjects.

or wooddy, not to many rifing from a roote and with fewer, and smaller leaves on them: the flowers allo are aor wooddy not to many ruing it out a roote and with meres, and, manuer are on them. The nowers and are a-like but (maller and vary as much or rather more in their colons, from being of a blewith purple, others purple and white, forme all white, other reddith or of a wan colons, be overworms red. Here is allo another for hereof whose lower leaves that (pread on the ground are many, and, rounder shanish any of the former, but those that grow on the stalkes are long like the rest, the slowers whereas are one; without mixture or va-

3. Polygala Mangeliaca. Millepungs of Mempeliers.

This French Milkewort bath upgight falkes a foote high, many riting from a final long white roote, with imdry longer and narrower leaves on them for without order; the flower entow one shops mather, in longer piles then in the other smaller, and not fully like the other, but of graduith colour, the feeds that followeth is small contained in long cornered huskes.

1. Polygala major...
The greater Militelyort.

4. Polygalarrans. Creening Milkewort.
This small Milkewort hath a number of stalkes, full of branches lying and spreading on the ground, not above a foan long, fee thicke by couples with very small leaves like Heraiaria Rupture wort: the flowers are of a whitish colour, standing among the leaves at the toppes in wharles compassing the stalkes one above another.

5. Polygale affinis. Bastard Milkewort.
This small plant spreadeth many weake slender round falkes upon the ground a spanne long or more, set with fundry small leaves without order; in fashion somewhat like unto Mirele leaves, but not fo much pointed, the flowcitate very beautifull, standing in a small spike one above another, with leaves amongst them, confishing of fixe leaves of fine bright thining purple colour, the feede is small, contained in small huskes: the roote is made of small long and whice fibres.

The Place and Time The fielt kinde groweth not in our Country that I can have of but in Angria, Germany and the parts thereabouts, found out by Clusters. The second is frequent with us, as well in barren and untilled places, heathes and the like, as infertile and palture grounds, yet there it will be more fielhand large. The third about Mempelier, and so doth the fourth and last and in other places in France not farre of. They all flower in the beginning or middle of May, and continue flowring a moneth, and perfect their feede prefemily after.

The Names. The name Polygala or Polygalon as Tragus doth call ir,is imposed on these plants, upon supposall that they are the Polygala of Dioscoridos, but they doe but resemble it, and arenot the same, and therefore Lobel calleth it Polygala recontierum, as not judging it to be right, which Gefner allo

before him perceived by the bitter tafte it hath, and therefore called it Amarella, yet according to the Germane rulgar name, he called it also Crucis flos. Dodonaws, [lusius, Lobel, and fundry others following the currant knowne mme, call it Polygala, as not knowing a fitter to call it by, yet Anguilana seemeth to call it The sion, and Dodonass Flor Amber vals. Clusius calleth the first Polygala vinlgaris major, and the second minor, although it be set amisse, unjor for minor. The third Baubinus reserved to the Onobrychis tertia purpurea of Lugdunensis, and calleth it himfife Polygala acutioribus foligs Monspeliaca. The fourth is generally called Polygala repens by Lobel, and all others that have written of it: The last is the Chamamyr fine quorundam of Lugdunen fir, which Banbinus calleth Polygale ofini as I doe. Bankinun numbreth up among their Polygala's, one with a yellow flower, which he referreth to aplant that Anguilara found, and was like unto a Lentill, but had thicker and fuller leaves, a yellow flower and kede in cods, which I have referred rather to the Scorpioides leguminosa, as I have there shewed. The Italians call it Poligala, the French L'berbe ancroiz, the Germanes (reutz blumlin, and Ramsel, the Dutch Cruzs bloomen, and we in English Gang-flower, Croffe-flower, or Milkewort.

The Vertues. Gefrer as I shewed you before, by reason of the bitternesse of this herbe, having called it Amarella, faith that he bund it to purge choller, having made the tryall of it on himselfe, by steeping a handfull thereof all night in wine, and drinking it in the morning, and therefore is not likely to encrease milke in womens brefts, neither bitter nor pargings thing working any such effect that we have known, and therefore cannot be the Polygala of Dioscorides, which worketh not that effect : other certainty hereof we have not yet learned, and therefore we forbeare to fee downe gheffes or falfities.

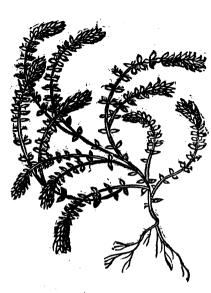

CHAP. VI.

Antirybinum flueftre medium. The greater wild Snapdragon.

He wilde Snapdragon is of two forts, one greater then another, the greater whereof rifeth up ufually but with one stalke, branching forth on all fides into some other, whereon are fet long and Majuaritformewhat narrow thicke darke greene leaves, by couples: ar the toppes of the stalkes and branches stand in severall places reddish purple gaping slowers, in shape like those of the garden or manured kinde, but farre less and without any white colour therein, after which come such like heads, like calves fnoutes, as in the other, but not halfe fo bigge, wherein is contained very small

blackish browne seede: the roote is small and perishing, every yeare regaining it selfe from the shed seede. We barehad another of this fort brought us out of Spaine by Beel, often remembred before, whose flower was much Betterm more beautifull, being of a bright crimion colour, the mouth or chappes being of a yellowish white, much like rubrum. one of the garden kindes, but more lively for colour. As also another with milke white flowers, which spreadeth Alterum broad a little more then the former. The leffer fort groweth lower by the one halfe, yet buffring thicker with fore also; blanches, having long narrow leaves not halfe fogreat, and the flowers very small alfo and whitish, the seede is Minimum.

4 Polygea repens. Creeping Milliewert.

1. Antirrhinum fylvefire medium. The greater wild Snapdragon.

Saxatile

small and blacker then the former, and the roote perisheth alike and is so also raised againe, Banbinus hath another of this fore with red flowers, whose leaves he saith are like Sarpillam, Mother of Time. The Place and Time.

These grow wilde in Spaine, Italy, France, and other places, but we have them onely in Gardens, where they that once fow them, shall lightly have them continually, if they will suffer them to shed their seede being tipe. and are in flower from Inly unto the end of August. The Names

They are called Antirrhinum filvefire, and arvense majus, and medium & minus, or minimum by all our moderne Writers, yet some call them Orontium or Aurantium, and Os larnie : Honorius Bellie in his second Epilie to Ch. fin , (a leth it Physeuma, and faith that in Candy the people call it xaoxovou. The Vertues.

There is as little use of these wilde kindes in Physicke, as of the garden kindes in our dayes, although Matthialus faith that the leaves, flowers, and feede are good for the rifing of the mother, to be mixed with Rofe waterand honey, and that the herb: doth cause the Scorpion presently to lose the force of his poyson, as soone as he seth it, and that the herbe applyed to the forehead taketh away the pin and web in the eyes.

CHAP. VII.

Linum fativum & fylvefire. Manured and wilde Flaxe,

Aving divers forts of wilde Flaxe to shew you in this Chapter, I thought it fit to prevene them with the manus ed kinde, and rather speake thereof together, then distinctly in a Chapter by it sife.

I. Lanum fairmen. Manured Flaze.

The manured Flaze hath a flender round pliant stalke three foote high, befor with person long and foft leaves without order, branshed at the toppe into three or four (mail branches, each of them bearing two or three faire blew flowers, wade of five round pointed leaves speece, with fonce

threds in the middle, after which come round buttons pointed above, wherein is contained flat shining smooth browne feede: the roote is fmill and threddy, perithing every yeare.

a. Linum selvefire unigarius. The more common wilde Flaxe.

This wild Flaxe groweth like the former, but hath greater and higher stalken more branched at the toppes, and more flore of blew flowers on them, the feede also is like the former, but the feede vessels will ho'd the feede therein, and not breake open with the heate of the Sunne, when it tripe, as the manured kinde will doe, which must be presently gathered and kept. 3. Lisani

3. Linum sylvestre latifolium caruleu n. Broad leafed blew wilde Flaxe.

This wilde Flaxe rifethup fometimes but with one tilke, and often with more, a foote or fometimes more high, which are stiffe, thicke, and hairy, fet with greater adbroader hairy leaves, then in any of the other forts, bestalkes branch forth towards the coppes bearing Imale intervesthen those below; and larger flowers, even as great as Mallowes, of a deeper or paler blew colour, the heads containing the feode are fet in the greene hankes, that held the flowers, which open being sipe, shewing ablacke flat shining seede like the rest, the roote is great undliveth after feede time, Thooting new ftilkes with woolly leaves on them, and to abide all the Winter: this groweth in Hungary and Austria.

Of this fort there was observed by Clufine in Spains, one with large broad woolly leaves like it, but the flowas were white with purple veines in the leaves.

4. Linnm (ylveftre latifolium luteum. Broad leafed yellow flowred Flaxe.

The divers stalkes of this Flaxe are round browne, and fliffe, with large leaves on them, and not hairy bithard: the flowers are many that fland at the roppre of the stalkes, and large, of a faire shining yellow colour, wir some threads in the middle, the seade vessels are flat " to, and the feede blacker then the other, and not flyining likethem: the roote is thicke and crooked, with fibres therest and parisheth not but abided many yeares.

Banh nu maketh mention of one with broad leave; whole stalke is glurinous or elsonmy, and the flower of a rescalour which grew on the hills by Bonenia, and about logalfied in Germany.

5. Limm fylurfire augustifolium carnito vos alba ... flore magne. Narrow leafed wilde Flaxe, with either white or blew flowers. This Flaxe hath fundry statkes, of a foote high, and ma3. Linem fylosilve tartfalian caratron.
Broad leafed blirte wilde Plaze:

5. Linum filvefice angustifolium caruleo vel albo sine ma oro... Narrow leafed wille blaze, with either white or bien tlowers,

ny'

7. Linum fylvestre angustifolium latenm. Narrow leafed wilde Flaze with yellow flowers.

10. Chandiann Ginfi fore albe five Liven fibrifie Gatheritesm. Dwarfe wilde Flaxe with white flowers, or Mill mountaine.

ny narrow long leaves on them, the flowers are very large, and are either of a pale blew, tending to an alh colon, or else white, each leafe having a purple line running through the middle, in the rest there is little difference from the former wilde forts, the roote abiding.

6. Linum folvestre angustifulum flore minere. Narrow leafed wilde Flane with small flowers.

The stalkes hereof are many round and stiffe, a foote long, staving many narrow short leaves thereon, of a blewish greene colour : the flowers are blew and no bigger then those of the manured Flaxe, the heads, seede, and rootes are like the reft.

7. L'aums pluestre augustifolium luteum. Narrow leased wilde Flaxe with yellow slowers.

This yellow wilde Flaxe hath fundry stalkes halfe a yard high, with sew leaves set on them like unto the manured Flaxe, the flowers are smaller then it, but of colour yellow.

8. Linum fruticofum semper virens. Everliving wilde Flaxe. This Flaxe hath divers wooddy stalkes of a foote high, with a number of leaves thereon, somewhat short and narrow, of a whitish greene colour, and abiding in the Winter on the stalkes, not falling of as the rest doe, the slowers are wholly white, and a little larger then the last, standing at the toppes of the stalkes like others.

9. Linum arboreum Creticum Inteum. The yellow shrubbe Flaxe of Candy.

This groweth like a small shrub, covered with a blackish barke, with long leaves, thicke set on the branches, somewhat like unto those of Flaxe but larger, comming necreft unto large Myrtle leaves, the flowers are yellow and very bitter in talle : the feede veffels are as bigge as Ciche peafe, containing foure feedes within them very like unto Flaxe seede.

> 20. Chamelinum Clusi flore albo, sive Linum sylvestre Catharticum. Dwarfe wilde Flaxe with white flowers, or Mill mountaine.

This Dwarfe Flaxe hath many flender stalkes, of about a spanne and a halfe long, with divers small long leaves fer by couples on them, and white flowers at the toppes of the branches, leffer then those of the manured, with yellow threds in the middle, the feede is small that followeth in the small round heads : the roots is small also and threddy,

F'or lateo Lobel setteth forth another small one, not rising above source or sive inches high, with small leaves and yellow

11. Chamalinum stellatum. Dwarfe wilde Flaze with starre like flowers. This whole plant is fearle three inches high, having but one or two very small stalkes at the most, and as small leaves ending in a very sharpe point, the flowers are few and small, made of five narrow pale greene leaves, point ted at the ends, and standing forth in that manner that every flower relembleth a starre, with a round umbone in the middle.

The Place and Time.

Some of thefe as is before faid, grow in Spaine, some in France or Germany, and fome in our owne Land also a some of the longer for the most part from Midforneser until August, and some abide longer, the seede ripening inte meane time.

Item in Lastice and there in Greeke figuliated as well the herbe as it growth, such fame prepared to be spunged when it is made into cloath also. The first is called by all Authours Lingua flatium, and the second Linum and when it is some into field of Germany in sunday placed because it yeeldeth more store of such that is to chiral Linum falcoffee to reside the sunday of the s h. The Armson of Flachs, the Dutch Vlas and we Flaxe, and Line. The Portner.

There is neither leafe, flowers, nor roote of Flaxeused in any meditine with patchar I know, ney ther greene nor dyed, neither the juice, diffilled water, or any other composition made thereps, but onely the seede, and that more noutward then inward Physicke in these dayes, although in former times as Gales showeth, that some union of the short food asked with the seed as the seed of the more in our ways then any area they read the state of the field of the the mooving of the belly downewards, faith he, I will neither praife nor dispraise it, yet it hash a small property to provoke urine, which it doth best being parched, thus saith Galen of the manured kinde, but the wilde kindes the freder of Line made into pouther, mixed with honey and some ppper into an electuary, and thereof the quantity of a Nutmeg taken every day, doth helpe the cough as fome fay, the feede also boyled in water, and fome honey put unto it and drunke, is faid also to ease the paines of the body; nthe collicke, and stitches, and all inflammations; if it be outwardly used also, with Fenugrecke and Linseed, and tome Mallows, a pultisbeing made therof is of good use to mollify and discusse any tumour or hardnes in any part of the body, or of the mother by fitting in the warme decoction of the feede, or to receive the hot fumes through a fate for the purpose + being taken with Raisins faith Pliny, it helpeth the obltructions of the Liver : the feede mixed with niter or falt, and figget tree ashes, easeth the paines and hardnesse of the mucles, since we and arteries, and used with figges, itripeneth and digestern, mixed with the wild Concumber roote, it draweth forth splinters, and used with figges, itripeneth and digestern, mixed with the wild Concumber roote, it draweth forth splinters, and used or any other thing sticking in the sless, and broken bones also: the decoction thereof made in wine thornes, nailes or any other thing sticking in the sless, and broken bones also: and applyed to any fretting or running fore, flayeth it from spreading surther: used with as much Cresses, it takes have the suggestions of the nailes, and with Myrrhe, and Rossin, it helpeth ruptures, and the swellings of the sade used with the sure of the sade with sade with the sade with sa and applyed to any fretting or tunning fore, flayeth it from spreading further: used with as much Cresles, it ta-

Carjophy Stycffra widner Small wilde Pinkes.

A vine the wird you to many Gittoffowers, Pinckes, (weere williams and Johns, of beauty in my former Booke, let me this term there there is that family, which are not of that refpect, and doe rather delight in their owner manually then in any other forraine habitation, and they are of three forta, or mying a piet in the fields on the mountaines, or among the rockes and stones; of these secretary in their order.

(a) op ylli ar verifes. Primus Ordo. . The first Rancke of wilde Pinckes of the Fields.

This wilde Pincke is but annuell, that is perifhing after seede time, having a few pale greene graffic short blunt even lying on the ground for the first yeare, and are the next years carryed up with the Italkes, divided into some braches, and fet by couples at the joy her he ring a thort thicke grayifh greene haske at the toppes, out of which fairout by degrees one after another; feven or eight fmall faint red flowers, fmaller then the imallest Garden prinches much, which fearle show themselves above the brimme of the baske; more flowers then one as I hid appeare not at a time out of the huske, or very feldome two, whereby they are long in flowring, in the outer

7. Garyaphy But hole fine remento fm.

1. Caryophythus prolifer. Childing Pinckes.

Caryophillus caraleus Monspelicusis. The bleve Pincke of Mo npelier-

huske is found after they have done flowring, fo many severali small long huskes as there did flowers thew torth, each containing within them fmal blackith feed, the roote is fmall white and hard, perishing every yeare, and raising it felfe by its owne sowing. or elle must be sowne in the Spring.

Of this fort there is one that hath but one flower rifing out of the huske, and of a paler reddiff colour then the former.

Carpophyllus pratenfis noster major. Our greater wild field Pincke.

Wee have in many places of our Land growing wild a small kinde of Pincke, as I may so call it, and especially by Deptford and Rederiffe, which spreadeth. much oftentimes, and rooting by the branches as it

Carrophyllin at venfis umbellaim. Wilde Pinckes in tufes,

goweth with small from ground leaves next the ground, sidy couples on the stalkes, with small reddish Pincke-like sowers on the toppes. Of this fort also there is a lesser, growflowers on the toppes. Or tous fort also there is a leffer grow-ing among the thicke graffe in our medowes about London, smely towards Tottam Contr., whose roote is so small and dreddy, that it will not abide transplanting, having very sender stalkes, and smaller, shorter, and greener leaves set thereon then in the former, the flowers also are smaller, and of a cleare red shining colour sometimes, but one of a stalke. and fometimes more especially under hedges and business the may defend it by the shadow. Of neither of both these have I any true figure, to exhibite here and I am loath to inhave I any true induce, we cannot there and I am town to in-fertMalter Johnsons figure, because it doth not truely expresse, sallo that it is Lobels figure of a small Armeria, which but leaves among the flowers, which these have not.

ath leaves among the nowers, which there have noted as 2. Caryophysiu arvenfit glaber minimus.

The finalleft white wild French Pinckes.

So 1 ewhat like unto the former two forts is this small one allo whose rootes are small, thred like and reddish, the stalkes aresender, smal and joyntedabout a foot or lesse high, having artiender, imai and joynevanous a root or iche nigh, naving final long narrow greene leaves, fer fingly thereat, and for eading at the toppe, into many thready branches, full of very final white flowers, confitting but of two leaves like threds.

4. Caryophilus caraleus Monspeliensum.

The blew Pincke of Monspelier.

The leaves of this Pincke that are next the ground, are fo fre and small like Rushes that they will be withered almost in the state of a white with greene colour from whence rife fundry flender fmooth joyntlesse rushy falkes halfe a foore high. bearing every one a flower at the toppe, out of a small huske, confilting of five blew round pointed leaves, finely dented about the edges, but no bigger then those of the ordinary wilde Centory, the whole plant taffeth formewhat hot and bitter.

5. Caryophyllus arvensis holostius hir/ntus. Wilde hairy Sea Pinckes.

This Pincke groweth very like a garden Pincke, but of a grayish or heavy greene colour, and somewhat hairy witha!, the flowers grow not like Pinkes in long huskes, but more like unto a small wilde Campion, of a reddish colour tending to murrey, and give finaller feede unlike to Pinckes, the roote abideth.

This wilde Pincke also doth truch resemble a wilde Campion, having short broad leaves, somewhat like unto Lobel his Catchflye, but of an hoary greene colour, the stalkes have the like leaves by comples on them, and at the toppe divers small flowers, rifing altogether from one joynt, and each standing on a short so testalke, composing threby a kinde of umbell, and are some of a reddish, and others of a whitish colour. I give you here Gerard his si-

gure thereof, more to please others them by selfe.

7. Car popyllus beloss in tomentosus. Hoary finkes.

From a small creeping roote riseth fundry stender round joynted stalkes lying on the ground, and dividing them felves into many branches a foote or two long or more, whereon are fet leaves by couples, fome of them broad and long, and others more round, yet all of them hoary white, like unto the leaves of the Gnaphalium Americanum alled white Live long or Life everlasting, bearing white flowers of five leaves a peece round pointed, this abi-

dethlong, and spreadeth much upon the ground.

8. Caryophylim angustifolism tomentosus. Honry narrow leased Pinckes.

This small low Pincke that scarfe rifeth with the stalkes an hand breadth high, which are woolly, branching inwitwo or three parts, fiath very narrow long and woolly greene leaves on them, one being longer then another, eth of the stalkes bearing a white flower, made of five leaves, standing in a greene huske.

thor the stances pearing a white nower smaller of the flow broad leafed Pincke.

Q. Carpopplin punish latifolium. The low broad leafed Pincke.

This small Pincke bath a short low stalke, rising from the roote, presently dividing it said in the longer on the of hilfe a foote high, whose lower leaves next the ground are somewhat broad and short, but a little longer on the branches, being soft and of a pale greene colour, set by couples at the joynts: each of the branches bearing but one faul pale purplish white flower rising out of a small short huske. The Place and Time.

Some of thefe as Isaid grow in our owne Land, some in Germony, France, and Spaine, some also flower earlier then others.

The Names. Lobel and Camerarius call the first Armerius proliferus, and Thaliss Carpophylla filocofici guarta. The second of both forts have their titles as belt beseemeth them, Gerard mentioning the first and my selfe the other. The third is so called by Bankinus as the title heareth. The fourth is called by Lobel Aphylanthes Monspeliensum, and by Tabermontanus and Bankinus, Caryophyllus caruleus Monspeliensum. Labertularis the fifth Caryophyllus holostic.

angustifolium. The last he also calleth as is in the title. I have Englished them all Pincker, not knowing how benie to entitle them.

Caryophylli Alpini, Secundus Ordo. The second R anke of Mountaine wilde Pintkes.

T, Carpophilms Alpinms lasifolism. Mountaine broad leafed Pinckes.

This hath a small white shorous creeping roote, and from thence rife some bending hairy stalkes, three or some inches long, with two small broad and somewhat round pointed hairy thicke leaves, at each joyur, and from inches long, with two small some what round pointed hairy thicke leaves, at each joyur, and from the large white shower of swelenges. Such of them a large white shower of swelenges. Such of them a large white shower of swelenges. I inches long, with two times to see and former and them a large white flower of five kaves, flanding in a greene huske, whereon afterwards flandeth a long huske with feede therein.

in a greens the second acted which the manufacture is a long attended to the property of the corte of this is the property of the corte of this is the property of the corte o a starre and the greene leaves of the buske, fet betweene them.

flarre and the greene leaves of the buske, let betweene them.

3. Caryophyllus Alpinus graminess. Mountaine Pincke with Graffe like leaves.

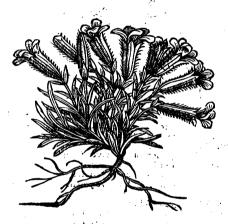

The leaves of this fort are very narrow, and about an inche long, of a darke greene colour like unto graffe fet by

The leaves of this for are very narrow, and about an investment of the leaves of this made of five leaves, flanding in fmall greene huske, out of which rife fmall heads, with small seede in them a the roote is small and white.

nall greene huske, out of which the imail neads, with mail the mountaine narrow leafed Pinckes,
4. Caryophyliu montanni anguftifoliu albiu. White mountaine narrow leafed Pinckes,
The stalke of this Pincke is small and reddish, three or four einches long, having long and marrow smooth leaves thereon, and smaller white flowers at the toppe then those of the first, here in this Ranke or Order mento-

5. Caryophyllus montanus Clufij. Clufius his mountaine Pinche.

6. Caryophyllus minimus mufcofus noftras Our fmallest Mosselike Pincke.

5. Caryophyllus montanus Clufi, Clufum his Mountaine Pincke. .

The leaves of this pincke, are tappy thicke and thort, fomewhat like to those of Thrist growing thick together: from among whom rife fundry flender foo: estalkes, rather then stalkes, about an inch high, yet having joynts and leaves fet by couples thereat, on the toppes whereof fland the flowers, each for the most part by it felle, whole huskes are large and hollow greater also then beseemeth the smallnesse of the plant, and of a purplish greene colour, ending in five poynts, out of which start small pale reddish flowers of five leaves apeece.

6. Caryophyllus minimus muscosus nostras. Our smallest Mosselike Pincke.
This small plant seemeth more like unto a Mosse, but that it hath some threelike slakes about two or three inches high, branching forth diverily, thicke fet together and without order, with small short graffe greene leaves, that are very narrow, and more like haires then leaves, seldome exceeding halfe an inch in length, whereofathough the most be plaine, yet some also will be parted on the side and forked like hornes at the ends, at the ropes of the branches stand divers very small and scarse to be discerned, greenish white flowers, which turne into small cods with feede in them as fmall as doft: this fpreadeth into many fmall tufts, rooting afresh as it groweth, but, dyeth after feede time, and springing from the seede that sheddeth and abiding in the Winter, with such a furth field auft of small greene haire like leaves as stand by the sides of it, until that it encreaseth and groweth bigger, as the whole plant is expressed.

The Place and Time. All these grow on hils and mountaines for the most part, the first and third in Germany and Anstria, the second in Spaine, the fourth in France about Mompelier, the last no where but in thise owne Garden that ever I could know, and doe flower in Inly, giving feede quickely after.

All the care lately found out, the foure first whereof are recorded by Banking in his Pinax and Prodromus, by when names they hold here in their titles, but that he addeth Holosius unto them. The last is as is said, not when the name of the production of the said before that I know. entioned by any before that I know.

tering much imatter then they the newers are purple, portained the male Neapolitane Fooled ones.

The male Neapolitane Fooled ones.

The flatke of this is a foote high, having leaves of the length of ones hand, and an inch broad, of a pale full greene colour, waved about the edges: the toppe of the flatke haths both of flowers, red before they opin, and of a faire blush colour being blowne, in forme like unto the office before the bood or helmet open, and imall level like eares on the sides, with short armes as it were hanging downe by the body, and the lower part with legs as it were cut of:

were cut of:

7. Orchie Anthropophora Oreades famins. The female Nespolitane Foolestones.

This other Foole of Naples, hath longer leaves, but not brouder then the last, foread on the ground, and some smaller on the stake, which is higher, the spike of flowers are not so great or thicke, yet in some like the last, but of a pale colcur, spotted very thicke, as small as sands awing the hood greenish with purple edges.

8. Orchie Zoophora Cercopithecame exprimens Oreades. The apish Foole of Naples.

The lower leaves hereof are shorter but broader, then the last, but those on the stake are much longer and mark rower, the spiked head of slowers is greater then the last, cash of them being of a reddish purple colour, so lively expression the forme of an Ape as can be but that the head is greater, as it were of a monster, covered withthe spike since yet like gares or leaves that are by it, and both it and the lower part which is biparted is sooned were fmall white fiver like cares or leaves that are by it, and both it and the lower part which is biparted is spotted very

The Place and Rose.

All these forts grow, most an end in fields, and by woods fides, and many in our owne land, and the three last on the hils in Naples; they flower in May as the rest doc. The Names

The names of all these are expressed in their titles, and the Authours are expressed in the margent, that have written of them, as is done in the last Chapter, which may fusice for this time. The Vertues.

The properties of these are like those in the former Chapter, and therefore whatsoever is said of them may be well refered to thefe.

CHAP. XI.

Tragorchie five Tefticulus bircinen. Stinking Grates Ronce.

Tertius Ordo. The third Ranke.

Hele Orchies are to named not onely because they have a strong foule sent like a Goate, but that most of them have long tailes like beards hanging downe from them. 1. Tragorchie maxima. : The greatest Goarts Stones.

This greater fore hath large leaves lying next the ground, fomewhat like unto Plantaine levelite chi naxima. The greatest Goates stones.

4. Tragorchie Batavica Chefij. 3. Tragerchie miner & verier.
The leffer but truer Goateftones.

shorter, the stalke likewise which is halfe a yard high, hath divers leaves thereon and a small spiked head of purple flowers, let in a comely row or order, having a long crooked thred or ftring hanging downe from each of them, and twining themfelves one within another, both the hood and the taile is footred, and have a firong fent: the bulbes are greater in thefe then in many other.

2. Tragorchie unlgarie five Tofticulus leporinus. The ordinary Goatestones or Harestones. This other which is the more common with us, hath longer and narrower leaves, the flowers are smaller and Testiculus This other which is the more common want in the more twining, the finell hereof is as strong as the former, but histom whiter, spoted with reddish spots, and the tailes are more twining, the smell hereof is as strong as the former, but histom while Lob.

Tragorchis miner & verior. The leffer but truer Goatestones. The finell hereof entire the name of this Orchi, which doth neerer refemble the rank ke finell of a Goate, then Tragorebia the former doe; but differeth in the leaves being much leffer, and the flowers being without spurres or tailes, and minor & forewhat like unto those noisome wormes that weecall woodlice, for their proportion, the colour whereof is verior Lob. fomewhat brownifh.

4. Tragorchie Batapica Cluss. The Hollanders Goatestones.

This stinking Orchie of Holland that was found about the Hage, as also about their Sea coasts, and as fittest re-Orchie ferred to this Ranke or Order, hath three or foure narrow small leaves, compassing a low stalke, about a span long, fextacia.

whose to this Kanke or Order, hath three or foure narrow small leaves, compassing a low stalke about a span long, sexuals, whose toppe endeshing short spiked head of flowers, of a fine purphilated colour on the inside, and paler without, having a belly or lippe hanging downe, which is termined in short-short and equal, parts.

6. Tragerchic altera purphera. Stincking County of Anstria.

The leaves of this Orchic are like Lilly leaves, of a pale greene colour, without any spots, or else purple Orchic as mind high, the spiked head of slowers is either of a whigh or place olour, without any spots, or else purple Orchic a with some purple leaves under them, each whereof is hooded and early with a take in giftelly, notched as it were clustered between seven another place.

The Place and Time.

The Place and Time. The former three form grow chiefly in clay grounds, the other two are expressed in their titles, and flower with the reft.

The Names. These kindes are chiefly mentioned by Lobel and Clusius, whose names I have entailed in the margent how to finde them which thall be fufficient.

The Vertues. Lugdunenfir from Dedoness faith that the rootes of thefa Orchies, are better alles any of the other, for the purposes aforelaid, of what other good quality they chiefly partake we cannot out of any ones experience relate anto Cluf.Thal. deferiptio.

Orchis Sphegedos

Minor. ejufde n. HLILOC .

TRIBE IS.

CHAP. XII.

Orchis Serapias five Testiculm vulpinus. Foxoltones.

Quartus Ordo. The fourth Ranke.

His fourth kanke or order must comprehend all those forts of prehides whose flowers doe represent fundry forts of insects, styes, or other small creatures, which for their fruitefull generation were anciently dedicated to Apie, who was worshipped as a God at Capope, not farre from Alexandria in Egypt, and from thence tooke the name Serapiae.

14 Orchie Serapiae bifolia latissima. The greatest twiblade Foxestones,

This hath onely two very large leaves, not much leffe then those of the white Ellebore or Neclewars, with di-Club is to vers veines running through them, greene on the upper fide and paler underneath, but shining withall, the stake default a cubit high, five square, with a few leaves or skins thereon, closing in a six were about, the shower grow in a spiked head like unto others, but great and large, being either purple spotted with white, or wholly white; the roores are great and fomewhat long like unto small Turneps, 2. Onchis Serapias latifolia altera. Hungarian twiblade Foxestones.

This other is very like the laft, but fomewhat leffer, and lower, both in leaves, stalkes, and flowers, and is found also both purple and spotted, and white as the former is.

3. Ouchis Serapias bifolia vel trifolia minor. The leffer twiblade or three leafed Foxestones, or white Buttersty Orchis.

This leffer Foxessone hath two or three large leaves next the roote, yet leffer then the sall, the stalke is more then halfe a foote high, with two or three peeces thereon, and a small tust or spike of white slowers at the toppe, thinly fer thereon, formewhat refembling white butterflies with their wings spread, each flower having a crooked taile b. hind it full of a fweete liquor.

4. Orchis Sphegodes five fucum referens. The greater Drone Bee flower.

The leaves of this Orchis are five or fixe, long narrow, and ribbed like Ribwort Plantaine, yet somewhat lesse, Pho litica. Testiculus the stalke is about a spans height, bearing five or fixe flowers at the head thereof, in fashion somewhat like a Bumble, humble or drone Bee, as it is called, having some few small whitish purple leaves likewings above, and a brownish belly or body below.

There is a leffer fort hereof, whose flower is lesser as well as leaves, and of a more whitish greene colour.

3. Orchis Scrapiae bifolia vel srifolia minor. The leffer twiblade or three leafed Foxeftones, or white Butterflye Orchis.

4. Orchie Sphrgodes five facum referens. The greater Drone Bee flower.

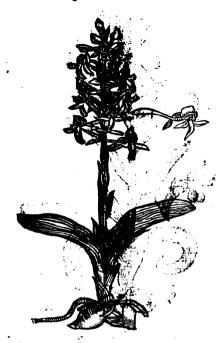

Orchis Sphegodes minor. The leffer Wafpe Orclis.

The Place and Time.

These kin les of Orchies grow in dry grounds, heaths, and waste untilled places, and the like, many of them in cut Land, and others in other places, and doe all or for the most part not flower untill August or September. The Names.

These also as the former have their Authours names set downe in the margent, and how they called them. The Vertues.

It is recorded by some, that the rootes of these kindes of Orchides are marveilous effectuall above any other to incite Venery.

CHAP. XIV.

Orchis Palmata, Handed Orchis,

Aving shewed you all the kindes of bulbous Orchides in the Chapters going before, there doth ver A ving inewed you are the kinde of handed Orchies to be entranged which although they be many, yet I thinke meete to comprehend the anall in this one Chapter, without parting of them.

1. Orchie palmata major min five Palma Christi mas. The great male handed Orchis.

This ma'e Orches hath divers farge broad and long smooth greene leaves lying on the ground, among which rifeth up a round talke, with some such leaves on it, but lesser up to the toppe, where grow a large head of pale purple flowers, potted with a deeper purple colour, each flower having a hele of the same colour behind it: the rootes are flat and broad, two joyned together at the head, like unto handes, patted at the bottome into fhort peeces, as if the fingers were cut fhort off by the knockles, with fome fibres at the head thereof also one of them being farme, and the other loofe or spongy, as in the former Orchides, which rise and decay in the like manner.

2. Orchis palmata major prateufis angustifolia. The great male handed Orchis with narrow leaves. The rootes of this are double handed like the former, parted into three parts below: the leaves are long and

1. Orchis palmata major mas five Palma Christi mas.
The great male handed Orchis.

2. Orchis palmata major pratentis angustifolia. The great male handed Orchis with narrow leaves.

1. Oribis pulmata famina five Palma Christifantua

maculato folio. The female hunded Orchis.

4. Orebis Palmata pratenfis maxima Conopfea dilla.

The greatest handed and hooded Orchis.

arrow through which the flalke rifeth, as through a pipe, to be a cubit high, whereon is fet a spiked head of inters, of a pale purple colour, with a spurre behinde, and a small leafe set with every flower at the bottome.

3. Orchis palmata samina sive P alma Christi samina maculato solio. The semale handed Orchis.

The leaves hereof are long and narrow, spotted diversly with blacke spots, the stalke hath likewise some nar-nwer leaves thereon, and a spiked head of hooded flowers, some reddish, either deeper or paler, or blush, or else chief. white, the lowest of them will be spotted, yet some will have none, the rootes are handed like the other.

4. Orchis palmata pratenfis maxima Conopfaa dicta The greatest handed and hooded Orchis. This rifeth with a stalke two cabies high, having fundry long and narrow leaves fet thereon, compassing it al- conoplea milat the bottome, the flowers who reof are hooded like the last, but of a dainty pale purple colour, and sweet Labello. Withall and flower late.

5 Grekit pa mara minor flore rabro. Small handed Orchis with red flowers.

This small Orchis hath a florider stalke, with a few long and narrow leaves set thereon, smaller above then those serapias blow, having a spiked bead of shining red flowers: the roote is small and handed like the rest.

blow, having a spiked nease or imming red nowers: the roote is image and nanote that the content of the spiked nease angultifolia minor. The lesser handed Orchis with narrow leaves.

The roote of this fort is incided but lesse, and the lower divisions of them are longer, the leaves are very long Orchis fa. adnarrow, the stalke growth a foote high, and the slowers thereon are of a pale purple colour, and the whole Tragition. That. pke thorter then others. Orchie palmaia angustifolia minor odoratissima. The sweete small handed Orchis.

This small for Lath rooms like the rest, the leaves are much narrower and tong almost as grasse, the stalke is a Prodro. and high, with very far allile wes up to the toppe, bearing the eon a finall fpike of pale purple flowers, very fweet oth having a hood and a life hanging downe, divided at the bottome into four parts with a heele behind.

8. Oychir paling a carpopyllata. Handed Orchis fmelling like Cloves or Gilloflowers,
The leaves of this fore are long and narrow, the flalke flender with fundry short leaves thereon, the spiked head

oflowers is purple, each refembling small fly es, and swelling as sweete as a Gilloslower, after which come great hads of small sende, the roote is handed, but hath the lower divisions much longer, running downe into the lob.

9. Orchie palman batrachites vel Myodes. Handed Orchie refembling frogs or flyes.

The leaves that grow on the Italke are fomewhat fhort and broad compating it at the bottome, the flowers Lot.

that Itand above are small with wings as it were above, and a long small body hanging downe and doth in some lott resemble a frogge as well as a flye, the roote hath shorter divisions in one part, and longer in another. 10. Orchis Caftrata. Gelded Ofchis.

This hath alfo long narrow leaves fet on a flender flalke, and smaller up to the tagone, where standeth a bending hadot white flowers spotted, each resembling a flye, the lower part of whose hanging body is more pointed: the Los. force is made of two long peeces like legs, ending in small pointes, and hath neither hands nor stones.

Trodro-

that the leaves hereof have no ipots and are more

TRIBE 15.

20. Orchis palmata montana maculata flore candido. Sported mountaine handed white Orchis.

The leaves of this Orchis are fornewhat narrow, and footed like anto the female handed Orchis, the stalke and flowers also are like unto it, and differeth not but in the colour, which is white.

21. Orchis palmata angustifolia Alpina. Small mountaine handed Orchis.

This small Orchis bath very narrow leaves as small 15 Crocse as Matthielus faith, the stalke is low and imil, bearing fmall flowers of a fad purple colour, like unto the purple flower gentle, and of a most fragrant feel while it is fresh and greene.

The Place and Time.

Some of these Orchier grow in fieldes and medows, fomein moorish grounds and marshes, and others uponlikand mountaines, and flower in the moneths of April, May, and Isme, some earlyer and later then o-

The Names.

Every one of these hath one Anthour named in the migent that hath written of it, and how he hath cal-kdit: as I have done withiall the rest of this family of the Orchides.

The Vertues.

These marsh stones are thought best to agree unto the Serapiades, and not so availcable to Venereous purposes, beigmore heating and drying then the Cyneforchides, and therefore may performe the cures that the Serapiaes doth indicers and the reft. Comerarism faith of this last fort that it is very profitable to stay the bloody Fluxe, if the flowers be made into pouther and taken in wine, or the fresh flowers fryed with egges into a Tansie, and so eaten. The mues of all the other forts of Orchides being boyled in red wine, and after they are dryed againe, made into pouher and drunke, doth fray the bloody fluxe in a speedy manner.

Orchis abarcina five Nidus avis. Mishapen Orchis or Birds nest.

Here are two forts of Birds nell, the one not much differing from the other, but in the colour, the first and most anciently knowne, of a yellowish colour, the other of a purplish violet.

1. Orchis abortiva ruffa. Ordinary birds neft.

The common Birds neft rifeth up with upright sappy weake stalkes, having a shew of leaves on them, which are very thort thin skins rather then leaves, of the fame colour with the stalkes and flowers, that is of a brownish dead yellow, the flowers stand upon a spiked head, like unto that of Orchis, and of the fame fathion, with huskes of dusty feede following them : the roote is composed of a numbroffibres, that croffe and entangle them felves one within another very intricately.

2. Nides avis purpurea. Purple birdes nest.

This purple birds nell groweth formetwhat lower having forme longer skinny leaves on the stalkes then the former with flowers on a spiked head very like unto the last for forme, but the whole stalk leaves, and flowers are of a violer pur ple colour, after which follow small seede like the other, theroote also is like the former.

The Place and Time.

Both thefe force are forceines found in our owne Land, in Woods and low Copies, and are in flower in ing and August.

Serapias candido flore montana Lob.

> Dod Camera,deferiptio.

The 2 ames.

Dodonem calleth it vierne Neottia, id eft, Nides avis, as it is with most now adayes, it is thought also to be the Coagulum terre of Pliny, Gefuer calleth it Orobanche, and Lobel Sasyrium abortivum & Orchis aborsiva Clufus calleth the last Limodoron Orena acoreson. Compos cancer the last comocoron first, and then Pseudolimodoron. The French call it Nid doisean, the Germanes Marghen dreben, the Dutch Vogelsness, and we in English Birds nest, of Goofe neft, from the platting of the rootes like the flickes and ftrawes in a Crowes neft.

The Vertues.

There is no use made of either of these that I have knowne in Physicke, or applyed to any other u.c.

CHAP. XVI.

Orobanche five Hemodoron vel Limodoron. Kill herbe or herbe bane.

Here hath bin found out of later dayes, divers forts of this Excressence of the earth (whereof there was but one fort or two as it is likely knowne to the ancients, or at leaft, no more

exprest in their writings,)under these names, which shall be here shewed you : but because I have already delivered you two forts thereof, the one rifing from Broome, called Broome rape, the other from the Ciffun, called Hypocifium, which may justly be referred to this family, I will not further mention them here. I confesse they might have been placed neere the Mosses and Mushromes as being excressences of the earth, as they are, but because their flowers and seede doe more neerely resemble the former Orchides, I thought meetelt to joyne thele unto them here.

1. Orobanche major Monspeliaca. Great Herbe bane of Mompelier.

This kill herbe hath a long and round small roote without scales, and with some fibres under it, the stalke is great and thicke, with very short leaves thereon from the bottome unto the middle thereof, where the flowers begin to grow, and with every one of them a larger and longer leafes the flowers are long and brownish.

2. Orobanche flore majore purpuras cente.
Great purple Herbe bane.

This from such a like roote with fibres thereas as the former, sendeth forth sundry stalkes with many thicke and short leaves on them sharpeat the ends, having some, times branches rifing therefrom, and fometimes two or three stalkes from the roote, and at the toppes are set with longer flowers then those of Broome rape on long foote1,2 Orohanche major Montpeliaca & flore majore purquafent. Great Herbe bane of Mompelier, and the great purple.

3. Ovoletche vomoft. Branched Harbe bane. Orthereit radio dentata for Dentaria Matthioti major & misor. Touchwort or Lungwort, the greater and the lefter.

hite, each flanding in a huske, with a long thred as it were growing out of the flower that turneth up againe, it whole stalke, leaves, and flowers are of a blewish purple colour.

3. Orobasche rameja. Branched Herbe bane.
Although many of the febrebes are found with fingle and unbranched stakes, yet some are found also that have much branched, but then for the most part, they grow lower themothers, and are of differing colours, some minth, some more yellow, some brownish yellow, and some blewish or purplish, for such are found in sundry which, tome more yellow, tome or will yellow, and tome or will have not per pine trees, Firre and Pitch trees, different Banhimus remembersh a small fort defect, that groweth lower, under Pine trees, Firre and Pitch trees, different Banhimus remembersh a small fort defect.

incs. Bashisus remembersh a small fort besof, that groweth lower, under Pine trees, Firre and Pitch trees, diffing elle in nothing, but in being of a darker colour, and the flowers whiter.

4. Orolancie radial desirate more first darkaria major Marthieli, a Great Tortingwort or Lungwort.

Molt properly may this territe be septimal of the fe formerly sepdoware, for their pitch admitty in many things: inthe for the roote small scales, if it may be sealed takes, lying somewhat desire, compact one upon another: in the best of the Spring, there rites out from the toppes of these scales, compact one upon another: in the besting in long, without any leaves, this besting many which purple gaping flowers, and backish inward, standing a backs, wherein a sterwards grow up we fell with small seeds in them.

The lesses of consistent of a smaller, by the scales and whitish purple flowers at the toppe, some their samples out two or three, and smelling many more. This varieth in some places being of a more purplish colour.

The flate and Take.

The flate and Take.

The fift directors grow many times from the rootes of fundry being, and by their imprinessed draweth out the summarish thereby thouling them, and sometimes among a field of Councille, Hempe &c. sometimes also of tells among the graife and he with by the sides of hedges, and under the findeby of trees, and many times also what shadow the other twist shall commonly under trees, where they have much shadow, and doe most sound in May and lime, yet so is the beene found in flower in Account.

Disserider callett, is country and decobance in Latine, but soft much life infrances and Orobance, of Theophramy which with the distinct translates in left the Oroban that it grower within and inneriore Lugdenraft the has pille which is called able to be I workerful in its Orobanche, as in the weather one in the Castin of the pulles, but of don't, it agreet to make I work in his Limodoron, as some have a but ascretizely Hamodoron, some work have it Limodoron in the Limodoron for the Limodoron for the Castin of the Orobanche, of as Control Based when the Limodoron assembly the described a cast can guarant assembly in the truck name in the translation of the Limodoron for the Donardoron for the Don The Names.

TRIBEIT.

will prefently goe to the Bull, some also as he fifth Henha Lupa, and some Coda di Lone. Because we had no proper English name for the former fores, and Tithought it improper to call them Broome rapes, as that is called which per English name for the former forts, and I thought a thing their property as I take it: yetler growth from the Broome, I have given them another English one, fitting their property as I take it: yetler every one doe as they thinke meetelt. The Vertues.

Dioscorides faith of his times, that it was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are, either was nied to be eaten as other herbes are at the was nied to be eaten as other herbes at the was nied to be eaten as other herbes at the was nied to be eaten as oth Disserted faith of his times, that it was used to be eaten as dry in the first degrees, our people doe many times which would helpe their digestion: Goden faith it is cold and dry in the first degrees, our people doe many times use the latter fort in medicines for the Lungs, having received it as a tradition from their ancestours, and therefore called the greater Lungwort : we have no other properties of any of thele herbes open unto you.

CHAP. XVII.

Cyclamen. Sowbread.

though I have given you in my former Booke a doozen forts or thore, of Cyclamen or Sowhead for whole knowledge I multreferre you thereunto, a figure of one or two being here flewed you inflead of the reft, yet: I have a ftrange plant to exhibite to your confideration, which was found and fent for a baftard kinde thereof and withall flew you the properties of the right more amply.

Pro Cyclamino yerno fourio mi fa planta. A ftrange plant lent for a baffind Sowebread of the Spring.

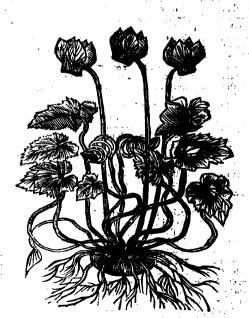

It had a tuberous roote varying from the forme of the Cyclamen roote, being long and thicke, small at the head and broad at the bottome, with a dent in Tombewhat like unto the forme of an heart, sait is pictured on the cards, or rather like these pin-pillow-pures, that bother women use to sticke their pinnes round about the brims or edges, having a hard thicke skinne of a brownish colour, with unarty leaf long round fibres underneath, and about it, from the tappe whereof role divers fomewhat round leaves a little pointed, refembling those of the rioke but smaller, some being larger and smaller then others, with three, five, or seven nerves or ribs in them, each upout imater, tome being larger and matter then others, with the state of the pareddiff flake, divided from the bottome into three or four branches, with the like leaves on them; and at the head of every branch, two or three small greenish yellow mostly flowers, much like unto those of the Ribes, or roll Currans, with divers vellow threds in the middle.

The Place and Time.

This grew on the Pyranean hills, fent by Venerine to John Hogheland, and other his friends in the low countries, and flowring in the Spring time.

> Cyclamen autumnale folia Hidera. Ity leafed Sowbread.

Pro Cyclamine verno fpurie miffa planta. A frange plant fent for a baftard Sowbread of the Spring.

The Names.

lengthis for a differing kind of Cyclamen, by the title it beareth, but as the description and figure declare. forms in the control of the control The Vertues.

plant being rage and lately found out and known but to few, I have not yet learned that any experience hath thereof, whether it hath any medicinal or other property therein: but because in my former Booke, I was the in declaring the vertues of the true Sowbread, I think good upon to fit an occasion to expariate them für-liert Although Mejues doth determine the degrees hereof to be not and dry in the beginning of the third, yet doch not fo, but faith only 70. Simplicium, that it cutteth, clenfeth & opneth the mouths of the veines, drawand digefleth, which is plainely teene by the particular operations thereof, for the juyce of it openeth the heambides or piles, and throughy mooteth to the stoole, being put up in wooll, and faith Mesus; it avoideth tought
and in a gliffer; it is allo mixed with such medicines as discusse swellings, kernels, and other hard knots in put of the body it helpeth also the pinge and webbe in the eyes, being influted with honey, as also avoideth is mourile, which Alejues also afficineth, and that by inuffing up the juice, the head and braine is purged from behinders that offend it, the ache also, and daily paines of it, and the Meagrome. Galen further faith, that if side behavior with the juice, it will for eably moove it downewards, and kill the birth, or to be put up in a and although the foore is weaker then the juyce, yet the roote being either drunke or applyed, provoketh mes, and is profitable for those that have the yellow jaundice, to drive it forth by fweating, if after the of three drame thereof in powther, in Meade or honied water, they be carefully ordered to sweate: it halfs to cleanie all the deformities or discolorings of the skin, and the freekles and spots thereof: as well a graphyed to the region of the spleene, it easeth the hardnesse thereof: some also saith he gave the dryed to the region of the spleene, it easeth the hardnesse thereof: some also saith he gave the dryed to the rare pursue or short winded. Matthiolog saith that the distilled water from the rootes saufted in the most rile, Rayeth their bleeding wonderfully and that if fix ounces of that water be drunke with an mire fing figar, it will flay the blood that commeth from the breft, ftomacke or Liver, in a wonderfull manner. fray reine be broken in them, and this is his attestation to hinder faith he, the violence thereof in purging, it is commethere with forme Masticke, or Nurmegge, or a feruple of Rubarbe: many have been holpen of the hardfeeld fwelling of the fpleene, by the use thereof, which could not be holpen by other things ! It easeth also is pines and torments in the bowels, which we call the chollicke; If faith he the roote hereof be bearen with few Patch from kernels, and birter. Almonds, and after laid to fleepe in Aquavita for three dayes: a drop or two deexproffed creame theref dropped into the caresthat are deafe or have much noise in them helpeth them: the remixed with honey or Plantage water, helpeth all maner of fores in the mouth or throate being gargled therein and the toothache also. Discorides, (aith many of the same things, and besides that the decoction thereof with wounds, the running fores also in the head, bones, or members out of joynts, kibes or chillblanes, and the tar. Pliny faith the roote is good against the venome of Serpents, and that it will kill Swine, which is conmto the received opinion of most, that they are delighted therewith, and greedily devoure the rootes, after they stored them up, from whence came the name Panis porcious, Sowbread: yet Thaliss, faith the roote is fitter Wolves, and Foxes then Swine, and that it is not to be inwardly taken, but by good advice and caution. Dioand Pliny from him fay, that if a woman that is with child goe over a plant thereof, it will cause abortion is, to be delivered before her time; but it is certainely knowne by many experiences that some of the fresh me leaves, but much rather, the fresh roote which Theophrass was a fairmeth, put into a cloth and applyed for the fector parts of a woman, that is in fore hard and long travaile in child birth, bath holpen them perdy and casic delivery: the roote beaten and applyed with honey, draweth forth splinters &c; out of the

CHAP. XVIII.

Epimedium, Barren Worts

Arrenwort is a pretty shrublike plant shooting forth fundry hard round stalkes, halfda yard or two foote high each stalke divised for the most part into three branches, and each of them bearing street states a petice which are severally, somewhat broad and round, yet pointed at the endea, hand or the wind a street street of the stalkes of leaves, shootest forth with them in the stalkes of leaves, shootest forth with them in the stalkes of states, and a street state of stalkes of leaves, shootest forth with them in the stalkes of leaves, shootest forth with them in the stalkes of leaves, shootest forth with them in the stalkes of leaves, district the stalkes of leaves, district branches, consistent on each of them three showers a peece, separated into source parts, as if the shower will but of source leaves, district the stalkes of leaves, stalkes of leav foore high each stalke divided for the most part into three branches, and each of them bearing three

Alterum Americanum magis fruticosum.

We have had brought a report fome of the Northerne plantations of America, a certaine shrubby and wooddy thinging forth chrice there leaves, composed in the same manner with the former, but each leafe was twife beget but we never faw he beare any flower or fruite with us, not did the plant long endure with us but by we have law repeate any nower of truite waters, not as the second restrict we have good new restrictions of the contract of th

The Place and Time.

Cafalpinus faith it groweth on the mountaines of Liguria, Camerarism necre unto Vicenzo in Italy, Banbinus on the Enganian hils, and in Romania, in shadowy wet grounds, and flowreth from Inne, unto the middle of August.

The Names. The Empudier Epimedium of Diescorides, hath beene diverily interpreted by fundry writers, some taking it to be one thing, some another: for Columna in his Phytobafanos, fetteth the Lanaria miner for it, but furely erroniously, and faith that neither the Hepatica trifolia, nor that Sefeli Athiopicum, which is the Libanetis Theophrasti withus, which some in and before his time tooke to be it, can be it. Bauhinsu would seeme to make Thaliss to meane the Caltha palustrie to be Dodoneus his Epimedium, when as I cannot finde in any of Dodoneus his workes, that he meant, or fet forth any other Epimedium then this I here shew you. So that I hereby thinke Banbinus was mistaken to quote Thalius to meane Caltha, and that Thalim also was mistaken in taking that herbe which he gathered as he faith in some place of the Harcynia sylva, and kept in his booke of dryed herbes, that had foure round leaves a little dented about the edges, standing each upon a slender footestalke, and with a blacke tuberous roote to be Esimedium Dodonei. which neither hath such round leaves, nor such a blacke tuberous roote. Anguilara it is thought, first entituled this Epimedia (which some in his time called Lunaria) whom all others that have set it forth fince, have so called, and yet some make a doubt whether it be Diofcorides his or no. First in that hee faith, Epimedium hath tenne or twelve leaves, when as the triplicity is fo conspicuous, that it is a wonder he should omit that, if he meant this: againe he faith it beareth neither flower nor fruite, when as this giveth both, yet hereunto it is affirmed that Dioseorides might faile in this, as he did in Dillamum Tuffilage Cynogloffum, &c. It in likely also that Theophraftus should meane this of Disfeorides, which in his seventh Booke and eighth Chapter, he calleth Epimetrum and saith it beareth no flowers, which Pliny calleth also Epipetrum, and some Epimenidium.

The Vertues. We have not any late experience hereof to thew but as Diofeorides . P. liny and Galen, have fet downe of it, that is moderately cold and moilt, and without any speciall property more thereto keepe womens brefts, from growing over great being made into a cataplaime, with oyle and applyed thereto: and that the report went that the root would make women barren that tooke it inwardly, as also the leaves made into powther and taken in Wine to fometime.

Viola Lunaris five Bulbonach. The white Sattin flower.

Here are two forts of this Sattin flowers one that dyeth after feede time, and another that abideth, both which I have fo fufficiently declared in my former Booke, that I neede not further to amplifie them. I will therefore referre you thereunto, to

be enformed of them, and onely here give you the figure

CHAP. XX.

Aquilegia. Columbines.

Have thewed you in my former Booke to many forts of Columbiaes, and of to many colours, both fingle and double, that I then thought there had beene no more to be fet forth, yet fince that time I have attained the knowledge of some others, which I thinke meete to expresse here, especially one out of Virginia with a lingle flower, which Malter Iohn Tradescant brought from thence,

Aquilegia Cirginiana flore rubessensenses. The early red Columbine of Virginia.

This Unrainian fort different listle from the ordinary single fort, but in these particulars: the stalke is as tall as Leguilegia, although Cornutus make it a dwarfe and reddifh, the leaves are smaller and somewhat like mothole of the Thalistrum, Medow Rue, but of a paler greene colour, the flowers are of a fad reddift colour. affinele from the middle of them to the ends, but yellowish from thence to the bottomes, the ends of whose here are not blunc as in ours, but stiffe rough, and pointed, within which horned leaves there are five other faller, and of a reddish colour also, their points bending downewards, having many small white threds in the tipe with yellow, after which come five pointed or ho ned feede vessels, with blacke shining seede whem; the roote is long with many fibres thereat. I here also give you the figure of the ordinary one, that you my fee the difference.

Aguilegia flore plans maculate diversorum colorum, Double party coloured Columbines of fundry colours? Mai before fald, I thewed you all the varieties of colours that I then knew, but fince I have feene and have fome wer fores, as first a kinde of darke red, which we call a deroy colour, both fingle and double, and a double with Mirefitipes therein, as is the party coloured blew, and white: then have wee a faire double red or crimfon cowhited in the fame manner with white another spotted as well as striped, very thickely, and of a haire colours hilleing firiped as the reft and another firiped and fometimes spotted, of a lived colour, or betweene blacke and blew, Besides the starte or Rose Columbines party coloured purple and white, and red and white. The Place and Time.

The fift was brought out of Virginia by Mafter Tradefeant, and flowreth somewhat carlier then any of out Girden kindes ufually by a moneth. The Names.

There friewed in my former Booke, the fundry opinions of Writers hereon, fome referring it to one thing fome minother of the ancients: but Cornitus is definite upon the point, that it was not knowne. And to moove one

Aquilegia vulgaris fimplex. The ord nary fingle Columbine.

Aquilegia Virginiana flore rulescente.
The red Columbine of Virginia.

Aaaaaa 2

to thinke his fort that came from Canada (which as I take it is the fame with ours of Virginia, how/lover he faith his fearferife a palme high) would by foulding the leaver containe Water in them, and therefore would referre the name to Aquileges that Pliny mentioneth, the pipes that convey water which containeth more conceit then verity.

The leaves of Columbines are commonly used in lotions, for fore mouthes, and throates, which effect it workers by the drying and binding quality therein. Tragis faith that a dramme of the seede taken in Windy that the Saffron, doth open the obstructions of the Liver, and is good for the yellow jaundite, and advised ties after the taken the resolution of the Liver, and is good for the yellow jaundite, and advised ties after the taken the resolution of the liver; and is good for the yellow jaundite, and advised the series of the feede for women that were in fore travell of childe birth, to cause a special edivery, being the saff of the condition of the first did not the effect. Conserving said that diverse in Spain did care peece of the roote for many daies together, to helpe those that were troubled with the Score in the reines and kidnies. Others doe use the decoction both of herbe and roote in Wine, putting thereto some Ambergrise, against these few your ings that the Greekes call dispayla.

CHAP. XXI.

Hepatica nobilu sive trifolia. Noble Liverwort, or Hepatica.

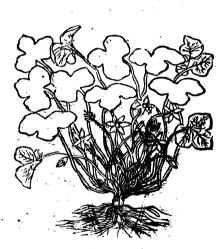

Lthough I shewed you in my former Booke, all the forts of Hepatica that then I knew, yet fince Master Tradescame found one other fort as I take it growing in Virginia, and brought is home with him, which differeth somewhat from the other fort wee formerly had, this bearing very darke greene leaves, and a small white flower, with a few white and not red thresh in the middle, but because I had some of the figures by me, I thought good to exhibite them in this place.

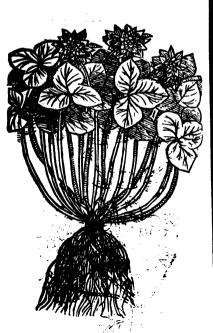

Their Tlace Time Names, and Vertues are expressed in my former Booke, wherever the state of the state of the figures by me, I thought good to exhibite them in this place.

Their Flace, Time, Names, and Vertues are expressed in my former Booke, whereunto I referse you, but 48 I here shew you, there is little Physicall use made of them, else I would willingly have enlarged the properties he e: these being more for pleasure to the senses then helpes for any disease.

Hepar e i noti is five trifolia fimples. Theo dinary fingle Heparica or Liverwort.

Hepatica nobilis five trifolia fore pleno. Double Hepatica or Liverwort.

CHAP, XXII.

Chrysanthemum & Buphthalmum. Corne Marigolds, and Oxe eye.

Here are fundry forts of these Golds, or Corne Marigolds, to be entreated of here, some whereof grow plenkingly snough, in our Cornefields, others being strangers, we have received from beyond Sea, and some I have set forth in my former Booke, whereof I thinke good to give you the figures, of some of them, and therewith of our garden Marigolds, and reserve your to the Booke; and for the neere affinity between these and the Buphthalmum, I thinke it not amisse to joyne them here also.

This Corne Marigold hath fundry tender pale greene herby stalkes, breaking forth into some sew branches, windivers long ble wish greene leaves, set without order on them, being narrow at the bottome, and broader sibtened, cut in a little on both edges t the flowers grow singly at the toppe of every branch, being large, growing out of greene scaly heads, and of a shining yellow colour, both the thrumme and the border of sewes about the tender of the being broad or star pointed, and cut into three or source parts, smelling a little sweete: the roote mishethevery years; and riseth from it owns sowing. Matthiolus hath set forth one of this sort, with leaves light like Feversew. The chiefest difference in this from the former, consistent in the leaves, which are whole selling, long and round pointed like those of the Daysies.

2. Chrifentheman fegerum Besicum. Spanifo Corne Marigold.

The flalkes here of are harder and browner then of the former, and fland more upright, the leaves are greener stand to much divided or cut in on the edges, the flowers are not of fo finning a yellow colour, but formewhat depryellow, the feede is small and whitish, and is bitter as the former is, although the herbe is sweete and earnass Salter herbe, and here in consistent the chiefest difference.

3. Chrysanthemum tennifolium Baticum Boely. Beel his Spanish Marigold.
Intheleaves chiefly consistent the greatest difference, betweene this and the last, for this hath sad greene leaves, very moch jagged and cut into very small and fine pates, and spike that but for the leaves, they could hardly be distinguished.

4. Chrysanthemum V. entinum Cluss. Clustum his Spanish Marigold.

Clustum his Chrysanthemum of Valentia in Spaine, wifeth up usually, but with one stalke of a spote high, parted-

Clusium his Chryfanthemum of Valentia in Spaine, sifeth up usually, but with one flake of a foote high, partedinto some branches, beset without order, with finer leaves then the latt, but of a poary colour, the flowers stand
soly like the rest, and of a saining gold yellow colour, but unlike in this, that this hash no border of leaves at all
southe middle head, but is bare and naked.

5. Chrysanthemam H. spanicium primum Clusis. The first Mountaine Corne Marigold of Clusius.
This hath many long leaves next the ground, resembling those of the white Wormewood, in the forme and

Chrisquibenum Craticum. Candy Corne Marigold. Calendula multiplex, & prolifera.

Double Marigolds, and lacke anapes on harfe backe.

divilions,

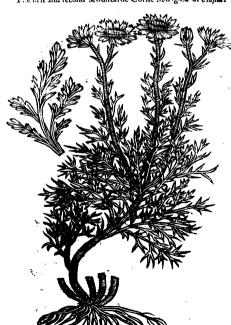

CHAS

TR 188 15.

1. Chryfanthemum fegetum noftras.
Corne Marigold or our owne Country.

5 6. Chr. fanthemum Alpinum primum eg feeundum Clufi.
The fi, ft and feeond Mountaine Corne Marigold of Clufus.

4. Chry fanthemam Valentinam Chifj.
Clufim Lis Spanith Coine Marigold.

10. Buphtbalmum Matthioli five valgere Odillefalij feliji. The more vulgar Oxe eye.

grisions, the stalke is a spanne high, fer with since out leaves, and at the toppe many yellow slowers set together; the unto those of Raggewort, the roote hath many white sibres.

the unto those or Angerwork, the roote nath many white hores.

6. Chryfanthemam Alpinsm fee andam Cluffi, (Infin his second Mountaine Corne Marigold,
The leaves of this fort is much more finely cut, most like unto those of Southernwood, of a pale greene colour,
and of no unpleasant savour, but somewhat bitter in taste: the stalkes are divided into some branches, bearing
sich of them one or two slowers, greater then Camomill slowers, and without sent, of a yellow colour wholly,
beather middle and the border the roots shath blacks in fibres.

7. Chryfantheman tertim cjustem. His third Corne Marigold.

Differeth little from the feeond in the leaves, being as fine cut, but are longer, thicker and greater, and the flowtingtow more together, and lefter than the former, and the roote thath white fibres.

S. Chryfanthemann Highanian roundioribus folys. Spanish round leafed Golds.

8. Chryfanthemam Hiffanicum roundieribus folis. Spanise round leafed Golds.

The greatest difference in this from the others, consistent in the leaves, which are not divided at all, but are long address, formewhat round pointed, and onely dented about the edges, the flowers are greater that grow on the top of the branches and stake, of a shining yellow colour, both border and middle through the roots is wood-tylaring many strings thereat.

9. Chrismsbergun larifolium Brasilianum. Sweete Corne Marigold of Brasilia.

This sweete Marigold springosh up with a stalke about halfe a yard high somewhat rough and cressed; having sowing smaller to the ends, somewhat dented about the edges, with sharpe dents, from the bosome of whom one forth somewhat long soverflat dented about the edges, with sharpe dents, from the bosome of whom one forth somewhat long spotestikes, sustaining each of them a faire yellow slower, set in a greene huske or up, having seven or eight leaves for a border, dented at the ends, and compassing a middle thrumms, consisting sloop threds, wherein attropywards lyeth the seede, very like unto the former Spanish kinde, the roote perisheth yearly in like manner, the herbe is so sweete that the Slugges and Snailes doe eate it above many other herbes in the Garden.

To. Bujothalmone Mastbioli five vulgare Millefoly folys. The more vulgar Oxe eye.

The more common Bujothalmone, with us, hath fundry faire greene leaves, divided very much into fundry other leaves, fomewhat refembling common Yarrow, and fo taken to be by diverse that looke but superficially theren, but heedfully marked different plainely from it, the divisions not being so thicke or small, the stalkes and branches, stand not up so strongly as Yarrow, and at the toppes of them beare but single flowers, lesser than the Corne Marigold, but wholly of a deepeyellow, and not shining, the seede solloweth in the thrumme, the note inflorus and perisheth yearely, or abiding the second yeare after the first sowing, which the Yarrow doth not.

It. Buphthalmum alterum Cotula folio. Camomill-like Oxe eye.

The weake sappy greene bending stalkes hereof, grow two foote long sometimes, with fine Camomill-like lares set dispersed the containing stalkes hereof are former of which beare a flower like unto the former Oxe eye, but he leaves hereof are somewhat larger, and sewer, and yellow, the middle thrumme being of a desper colour, and somewhat hollow.

12. Buphthalmum flore purpurafeture. One eye with purplish flowers.

This One eye with purplish flowers, different not much from the last, in the manner of growing, or forme of kaves and flowers, but herein chiefly, that the backe of the leaves of the flowers are either wholly purplish or else

11. Buphthaloum alterum Cotula fol.o. Camomuli-like Oxe eye.

12. Bapbthalmam peregrinam Alpino. Shrubby Oxe eye.

TRIBE 15 14. Buphehalmum Africam termifothem Boelij.
Thinne leafed Oxe eye of Barbar).

purplish in the middle: the stalke also which in the other is greene, is more reddish in this.

13. Bupbehalmam peregrinum Alpino. Shrubby Oxe eye.
This strange Oxe eye riseth up with divers streight, round, stender, darke greene stalkes, three cubin high, branching forth into divers parts, whereon are many fmall fresh green leaves, much divided, and somewhat like to those of Fennell, the flowers are twice as large as those of Camonill, and wholly of a shining gold yellow colour, set in greene heads or huskes, wherein afterwards the small long white seeds is contained: the some is long slender and blackish, abiding firsh and not perishing after seeds time. Alpina misliketh that of Mathiolus, because the leaves were not like Fennell, nor the flowers bigger then Camomill.

14. Buphthalmum Africanum tenuifolium Boeliy. Thin lealed Oxe eye of Barbary.

Although Alpinus supposed that he had set forth the truest Oxe eye of Dissective, yet as you may see both by the sigure and description of this is here give. His is in some things defective, and this in my opinion is thence. reft in all things thereunto, it rifeth up with one flender flalke, with divers long thinne leaves diverfly parted, comming of cerer unto Festiell then any before, bearing a large yellow flower at the toppe, where it brancheth forth, and bearth leaves and flowers on them likewife : the rooto is full of flrings, and perimeth after feede

The Place and Time

The Corne Marigolds grow for the most part in the Corne fields, and about the borders of them, or where Corne hath beene fowner formerly, either in our owne land or in others, as by their titles are to be knowne. The Oxe eyes generally gro w in the moilter ground, by water courses and the like, in other Countries, but in Gardens onely with us, where they are fowne, and carefully kept, and doe flower in the end of Summer,

The Names. Rougand silver in Greeke, is Chryfanthemum in Latine : ab aureo floris colore fic distant : there is much controverfie among divers concerning Diocorides his Chryfanthemum, which he faith some called also Buphthalumm, because what soever he had said of Con fanthernum, he said the same in the Chapter of Buphthalmum, thereby suspense ding the Chapter of Chryfanthemum to be thrust into the worke of Dieferrides, by some others, and they are the more enduced her entro, because neither Pliny, Galen, nor Leineta, make any mention of Chrylanthemum, but of Buphthalmum onely, as though they knew no other (brylanthemum: but Matthiolus evidently elecreth the matter, shewing how Dioscorides by their severall markes, doth distinguish them, saying Buphthalmum hath Fennell like leaves, which he faith in Chryfanthemum are onely cut or jagged: againe the stalke of Chryfanthemum, are eaten as other herbes, which he doth not say of Buphthalmum: and lastly the flowers of Chryfanthemum be saith are much thining, but he faith of Buphthalmum, that they are greater then, of Camomill, befides the flowers of Buphthalmum made up with waxe, is a falve to diffolve fwellings and knots, but of Chry anthemum he faith, fimply it discusset that Imposshume that hath like fat in it. There is no lesse doubt about his Buphthalonum, what herbe knowne to us should be the right, some taking the great white Daisie and Fuebfin and Lonicerus, the May weede to be the right, meither of which can be fo, in that they are not all yellow, as Diofeorides faith Buplebalmann flowers are Matthiolus therefore hath fer forth one, which is most commonly received by most to be the trues, although both Lobel, Dodoneus and Dalechampius have fet forth others, which they tooke to be rightest. The first

the is called Chrylanthemum and Jegetum by all Winsons abmost, wer some and Banhims with them call it Bullin in. The fecond bath no Auchour before this expresion at. The third is very likely to be the fecond fort of minmum Creticum of Clafin. Which Bonbinu referreth to the Achillan montana arthemific tennifolia facio Liel, and the Ageratum ferulaceum of Lugdunentis, but neither of them truely. But the first Chryfambenna Creof Island the Agernium formaceum of Lugdamenjus, but neither of them truely, but the first Conginumenum cre-nium of Clufius. I sale have the Longian beamen Createum that I have fet forth in my former Booke, and which for interior salesh Ruphibal num alcorum partim candido partimeters fore: But Befor in horse Enfectors Corp-lating Cretifium missium. The tout this the Configuration of Clufius which Lugdamens to the things for the figure of the Bushibal numerous of Clufius in the Christophen second for the interior of the first but the salesh numerous configuration in Christophen in the Christoph Narbonense tennisolium of Lobel in his Observations, as Banbinus quotethit, which Casalpinus calleth Chrylethenem alternet on Sicilia: The three wext are Clufter his torts of Chryfauthennem Alpinum, wherei as I faid beine, his second is very likely to be also this third fort here expressed, or very like it. The righth is Lugidimentis, in Chr fanthemum Myconi, which hee faith the Cafislians called Giralda. The ninth wee received by the fame in Configurerment to Journ, which her later the Capsison cannot virtues. In entire we received by the same une that Agadison solice in this Bristonian, and is of Braffield. The tenth is generally called Buphrolumnum also principly those, and taken to be that of Dissorder, which he faith is called Cathle also, yet some which is also Cornelland and Furner. The eleventh is mentioned onely by Cambridge in his Mattheless, and the Bandison after him. The last is called by Lobel Buphrhalmon folio & fucie relationship in his Adaptions and Lancer, and is the same with the tennifolium Nanbonens, in his Observations shough Bankinus quoteth them as differing plants. The Vertues.

pund finds that any Authour hath entarged the properties of Corne Marigold, beyond that which Diofeorishiffilet downe of it, which is to diferife that Importume, that hath like fat in it, and that it will helpethem hathave the yellow jaundife, to have a good colour if they drinke it for some long time, continually after baming. And of Buphrhalmum, the Oxe eye, that the flowers made up with a cerote, doth discusse tumours, and hardresse, and helpertithe jaundise (as he saith by hearessy in both these) and to get a good colour, to drinke it after bithing by continuance.

CHAP. XXIII,

etennumber of a togal inches Toffideo montana. Mountaine Coltsfoote.

Here are awo we thice fores of these Cokafoote of the Mountaine to show you in this Chapter? I. Tuffilaga Alpina folso glabro. Smooth leafed Mountaine Coltsfoote. The roote hereof creepeth under ground like the common Colustoote, and will simolt ipread as much ground, from whence ipring fundry round leaves, each rifing by it felfe, with a long footestalke under it, and are a little notched or waved about the edges, imooth, and of a darke greene colours on te upperfide, and not thining as the other, nor woolly underneath, among which rifeth up tome stalkes, a spanne mg, with a finall long leafe or two thereon, and a purplifh flower at the toppe composed of threds which when is ripe hath feede therein, that with the downe flicking to it, is carryed away with the winde.

. Tuffilago Alpina folio canescente. Hoary Mountaine Coltafoote This other Coltafone different not in forme of leaves or flowers, being also purplish, nor in the manner of grow-

ing, but onely that the stalke is woolly, and the leaves hereof are very rough, and of a darker greene shining colour, on the upper side, and more heavy or very woolly underneath. Cinfin giveth another squre also hereof. lour, on the upper fide, and more noary or very woonly under income of the one, and the closed and decay.

3. Tussilago Alpina felio oblongo. Mountaine Coltsfoote with longer leaves. This hath five or fix fomewhat long leaves, riging from a blacke roote, of the bignefie of one little finger, with This hath five or fix fomewhat long leaves, rinng trom a blatte tooley or the beginning the firm force it, each fet upon a long flalke of an unequal length, fome longer then others, hard, rough, heir, and of a darke greene colour, inipped about the edges, from whence riche the flalke of a cubits heigh fet with and of a darke greene colour, impped about the edges, from whates are the toppe, which being two or three narrower leaves, branched fometimes with a large yellow moffic flower at the toppe, which being ripe vanisheth with the winde.

The Place and Time.

These grow on the Alpes of Austria, and Syria, and elsewhere in Germany, and on Mount Balden in Italy, and flower in Inne in their naturall places, but in Aprill and May, being transposed into Gardens, The Names.

These being but of late invention, have no other name imposed en them then the first finders gave them, which is Tuffilago Alpina, for to Clusius doth entitle them, the first being his second, and my second his inst, which Clus 15 (14) itage Alpina, for 10 Cinjim doth entitle them, to the Marina of Marthielus, but affordly was niftiken therein, for although he feeme to determine the question absolutely to be the same, yet he leaveth it for every one to judge as he lift. The last is so termed by Bankinns as it is set downe in the title. The Vertues.

Although the forme of the leaves and flowers doe cause them to be referred to the Colts foote, yet it is not Although the forme of the leaves and nowers due caute them to some and the leaft made knowne to us, of any the like faculties, any of them are endued withall, and theretore untill they can fay more for themselves let them be held to be mutes.

CHAP. XXIV.

Arttium montanum quibusdam: A kinde of mountaine woolly plant or Beares wort.

His plant hath diverse faire and somewhat large long leaves like unto Mullein, somewhat green show and hoary or very white below, and full of veines: the stalke is smooth and covered with much wool. bearing one great head, scaly on the outside, but without any prickles, and with a yellow thrumme for the flower standing within it, which when it is ripe is by peece meale carryed away in the winde, with the feede hanging thereat, which is like unto Cummin feede, the roote is thicke long white and tender.

> Arclium montanum qui busdam. A kinde of woolly plant, or Bearcwort.

Arttium en codica Gafareo. Cafars booke Arti

The Theater of Plants. TEIBE 15. there hereanto put the figure that Dodonom faith, bee tooke our of a Manuscript Herball of the Emperours, the herber he tooke to be true or no, he doth not fet downe, but furely I thinke both this and all the others

The Place and Time.

Biggrowsthamong the Rockes, on the Mountaines in Savor.

The Names.

listaken by fome to be the agunor or aguricer of Diofcorides, Galen, and others, which Pliny also calleth Artisms and Arthurnin, Lugdanessis onely doth exhibite this to view, under the name of Arthurn anorundam, which Banin calisth. Lappa mentana altera lannginofa: falling on the fame rocke that others before him did, to put no difmathetweene Arceion and Ardium, when as Dioscorides, hath so punctually divided them, for afforedly it where fui generie, and hath no fellow.

The Vertnes.

If this be the true Artium of Dioscorides, then he faith that the roote and seede boyled in Wine, will helpe the nothering if the decottion be twitt in the mouth: the fame decottion is good for burnes, kibes; and chiblaines on the heads and hands to be backed there with: it is also drunke with Wine against the paines of the Hip-gout asdaries, and the Strangury. Galemeonfirmeth the fame things, faying it is of thin parts, and doth moderately. de me deanfe.

CHAP. XXV.

Melanthinm five Nigella. Nigella or Fennell flower.

Here be fundry forts of Nigella flome fowne in Gardens others growing wilde, most with single, and some with double flowers of the double forts, and of the Spanish single kinde, I have spoken already in my former Booke, the rest shall follow here.

1. Nigella Romana five fativa. The Romane or fweete fmelling Nigella.

This sweate Nigell groweth up to be two foote high, with fundry flender branches, and many and cut and divided caves on them simohas finall as Fennell, and very like unto those of the Latkes beeles, at the my of every branch standards one flower, made of five blew leaves laid abroad like a ftar, without any greene langunder the floweres in force fingle and another double blew fort, with a greene head in the middle, compatd with some few thieds, which head groweth to be the seede vessell, being a little long and round, with five fall these soppes like houses, franching at the coppes of the heads, in which lye in feverall cells, small blacke, and my sharps sweets strong smelling seeds: the roots is small threddy and yellow, perishing yearsly.

1.3. Nigella Romana fativa. & (ylveftru, floribu nudu & folioji. The first Romane Migella, and bee the forts of the wilde!

Nigella Hifpanica. Spanish Nigella,

2. Rigella/ylvestris sive Damascena inodora. Wilde Damaske Nigella.

This Nigella groweth very like the lormer, for the greene leaves, but a little imalier and shorter, the flowers This Nigella groweth very like the former, but the head with feede is larger, and the hornes longer, the feede also within in are blew, and like the former, but the head with release and without any fent at all. There is another of this fort as I take it, that differeth onely in bearing fingle white flowers, and blacke feede without fent. . Nigella arversis. Field Nigella.

This field fort is very like the laft, but groweth thinner of branches and leaves, and they shorter also, the heads are smaller and longer, as the flowers are also but of a pale blew colour, the seede is blacke and without any smaller and longer, as the flowers are also but of a pale blew colour, are imatter and longer, as the flowers that being fingle and blew like it.

There is of this fort another, differing little from the other, but in the flowers that being fingle and blew like it. Altera cape hath greene leaves under them, and the feede being blacke is foriewhat fweete.

tibus fattoff.

th greene leaves under them, and the lettle being black of Candy without sent in the seede.

4. Nigella Cretica inodoro semine. Nigella of Candy without sent in the seede.

This Candy Nigella groweth with fine cut leaves like the other, but of a darker greene colour: the flowers are Inis Canay Ivigens, growth with most oppes of the stalkes and brar thes, greenish at the first, but blewish afterwards, the ends of the leaves keeping a little greenenesse still in them, with many greenish threds in the middle, tipt with blew: the feede is blacke like others and without fent, that followeth in such like horned heads as others: the roote is fibrous yellowish and annuall.

5. Nigella Cretica latifolia odorata. Candy Nigella with broad leaves, and sweete smelling seede. This broad leafed Nigella rifeth up from the yellowish, thready and annual roote, with one slender weake half. divided into some branches, having long and divided leaves fet thereon, but not of the forme of theother Nigella, which are fennell like, or Laikes spurre like, but much broader and parted into divisions, somewhat like unto those of Groundfell, but cut Into lesser and finer parts, at the toppes of each of the branches standeth a single white flowers, like unto the other Nigellas, and heads somewhat like them succeeding, containing blacke seede alfo, but finelling fweetely.

6. Nigella Cretica altera cdorata tenuifolia. Another fweete Candy Nigella.

The rootes of this Candy Nigella, are faid to be harder then the rest, yet annual like them, the Ralkes that rife from thence are many upright and flender, parted into severall branches, with but few leaves set thereon, those below being not fo finely minced as the former, that are upwards; having smaller yellowish white flowers, at the roppes of them, and cornered blacke scede sharpe and somewhat sweete, contained in small biformed seede reffelsor heads, like two finall berries.

Nicella Cretica odorata feminibus hiformibus. A Sweete Nigella of Gandy with double formed seeden. This wonderfull kinde of Nigella (for so it is called) groweth from a small sibrous roote, with many seader falker, and few branches rifing from them, not much above halfe a foote high, fet with long winged leaves like those of Flaxe, opposite each to other on a middle-rivbe, at the toppes of each whereof standers a large blew slow. er, fomewhat like unto the flower of a Poppy, 'after which' come five cornered heads, containing small blacke

4. 5.6 Nigella Cretica innaoro femino latifolia & tenuifalia o lorata. Cand) Nigella wi hout fenr, and two other with fweet fmelling feed. 7. Nigella Cretica ederetu falijs Lini feminibu bifornibu. Sweete Nigelia of Candy, with double formed feeder,

tien gether like a bunch of grapes, which are whitifh, nature thus providing it with a double issue, least it meling feede: but belides thefe at the joynting of the branches, come forth other forts of feede clu-

2. Nigella Citrina flore albo simplici. Single white Nigella with yellowish seede. Weebave also in our Gardens, another single fort of Nigella, that hath come among other seedes that hath the fent from some of our friends beyond Sea, that differeth so little from the other usuall forts, that it can but be differented, except it be in the fresher greenenesse of the leaves before it come to flower, which then is callike the third wild fort here fet downe, but white: the heads also are small but formed alike, having smaller me within them, not blacke as others are, but yellowish and without sent, and herein it is somewhat like unto double white kinde, described in my former Booke. The Place and Time

the first is usually lowen in Gardens even in Italy or else where, the other forts grow wilde and in the fields of Case in Italy, Candy, Germany, oo, they are all annuall to be fowne in the Spring, if they doe not fow themthe and flower in Inne and Inly, giving ripe feede in August. The Names.

triscalled in Greeke undai Stor and un de acquer, Melanthium also in Latine, and Nigella a nigro seminucolore ut inimiand ariciently called Gith, divers other baltarde names have beene given it, as Salufandra and Papaver niin the Greeke word: all late Authours call them either Melanthium or Nigella, onely Fuelium and Cor-trook it to be the Caminam filvefire alterum of Dioscorides. The Arabians call it Xanim Sunis or Sunisi. The lulian Nigelle, the Spaniardes Azenuz, and Nignillia, the French Poyurette and Nielle, the Germanes one fort St. tanium blumen, that is, St. Katherines flower, the wilde fores Schwartz Kumel, and Schwartz Rommich, the Dath Nardus faer, because they and others had a perswasion that the oyle made out of the seede was Oleum Medium, We call it in English either Nigella after the Latine, or Fennell flower, as I doe. For the understandisgoithe severall Authours of these: the first, second, and third, are mentioned by our later Writers, by those diagonic leverant naturalists them. The fourth is called by Banbinn Nigella Cretica simply, and by Clusius Me-lestion Creticam: The fifth is mentioned by Pona in his Italian Baldun; the seventh by Alpinni in his booke of Enoticke plants. The fixt by Pona in his Italian Baldun. The last as I thinke is not mentioned by any Authour: The Vertues.

The sweete smelling seedes are effectuall to many diseases, but the first kinde is onely used in medicines, the oher that doe not smell well, are in a manner refused, Galen faith it is hot and dry in the third degree, and of thin puts, and thereby it he peth to dry up rheumes and destillations from the head, being tyed in a cloath, and imelled me, but being put into a cappe among other things for that purpose, it doth much good: being taken inwardly respelleth winde, the wormes, and womens couries; it helpeth also the shortnesse of breath, and cleanseth the hidneyes of gravell, and the stone, and provoketh urine, being taken with honey, and is a remedy against poylon, ad the biting of the Spider Phalangium, and the Scorpion, and as it is faid encreaseth milke in womens brests, beig boyled in Vinegar, it helpeth the tooth ache to be held in the mouth: the same used outwardly helpeth the forfe, freckles, spots, &cc. in the skinne, and hard swellings also, and cleanseth the eyes: being burned, it driveth way flies, gnats, and the like, the seede was familiarly eaten in former times, being strawed on their bread, or metherein as Poppy leede was. Alpinus faith, that the use of the fifth fort is very effectuall, both in tertian, and quertane agues, to open obstructions especially, if the seede thereof be boyled with Vinegar and so taken, and kilth the wormes also.

CHAP, XXVI.

Pisum vordatum vesicarium. The bladder heartlice spotted Pease.

Lthough divers have diverfly thought of this plant, some referring it to the kinde of Halicacabin, or Alkakingi, Winter Cherry, others to other plants, yet feeing it agreeth with none of them all, but in some one thing or other, in others, wanting some one thing or other. And because I could not finde a family whereinto I might thrust it, I have kept it for this place, untill some fellow may be found to match it with. Take therefore the description thereof thus. It rifeth up and spreadeth much, if it have good ground to grow in, having fundry slender weakestalkes, which will lie down on the ground, and entangle it selfe with the classers it bath, unlesse it be sustained with some stakes, fending

forth large long, thinne, and very greene leaves on all fides, upon long footestalkes, being divided either into three offive parts, each whereof is much rent or cut in on the edges: at the joynts with the leaves from the middle. of the stalkes almost, upwards, and at the toppes of them likewise, come forth divers small whitish flowers set ngether upon a footestalke, each consisting of five small leaves apeece, which passe into small fruite, contained in round greene bladders, growing more whitish as it ripeneth, having fixe ridges, whereof three are the more eminent, and open into three parts, in each whereof lyeth one round hard, blackish seede, of the bignesse of a great Pale, spotted on the side with a marke, of the forme of a white Hart, as it is usually set on the cards, or as some compareit to the shaven crowne of Monckes and Fryers, the roote is bully or stringy, with many fibres thereat, perishing every years, at the first approach of a Winters day, whether it be ripe or no, and indeede I did never feit beare ripe fruite with us, no not in the hottest yeare that I have sowne it. The Place and Time.

It hath come from Italy, and other parts beyond Sea, but furely even they have received it from other places Mo, nor doe I thinke it groweth naturally in any part of Europe, it floweeth as is faid very late, and the feederipeneth thereafter.

The Names. Some as I faid have referred it to the Solanum veficarium, or Halicacabum of Dioscorides, and thereupon have alled it, Veficaria peregrina for Halicacabum peregrinum, or repens, as Tragui, Fuchfisis, Gefner, Matthiolin, Dodoneus

and others, but Cordsus on Dioscorides carnelly Striveth to make it the Dorycnium of Dioscorides, whereunto it seemeth he was led, not onely from the feverall parts of the forme thereof, except the leaves, but also from the propercies of the feede, which as hee faith, he tryed in himselfexo be dangerous in provoking sleepe, if too much should be taken, although as he saith it causeth a sweeter sleepe then Opinion: but Matthiolus contesteth against him for this his opinion, but sheweth no reasons for it : Dodineum miliking others opinions, bringeth in one of his owne, that this is Serapio, his Abrong or Abrugi, mentioned in his 153. Chapter, in these words: Abrong It is a small graine sported with blacke and white, and like unto the graine Maiz : Lobel affenteth unto fuch of his friends as tooke it to be Dioscorides his Hopyrum, whereunto it commeth neeter as he faith, then unto any fort of Melanthium, luch as Matthiolus gave it for, or as Dodonaus in his French Herball, Trifolium paluftre : but all alike, every one wanting some thing or other. Lobel calleth it the efore as it was usuall, Cor Indam, or Pijam Indicum, Cordus granum cordu, and Tabermontanius Cardiffermen;

Some afignatur would make it availeable for faintings and other difeates of the heart, but without experience as I thinke. Cordun faith as is before related, to be a great provoker to fleepe, even to the danger of life, if the quantity be not proportioned: I find not any of the other Authours that hath written of it, hath fet downe any property they knew, or heard to be in it.

Tragus also saith it was called with them Munck's Kopsimides, Monachi culvaria, or as Gesner saith, Caput Mozachi Lobel also calleth it Pique Cordatum, but Baubium putting it among the Pease, as a fort thereof, calleth it Pisum vessearium fruttu nigro alba maculata notato.

CHAP. XXVII.

Delphinum sive Consolida regalin. Larkes spurres or heeles.

Have in my former Booke shewed you all the forts of Larkes spurres, both tame and wilde, both single and double, both simple and severall colours, and party coloured, that I have not any more to bring to your consideration: Yet I

thinke good here to present you with some figures of them, that I had by mee, and with them a kinde of different National Indicum. In the forme of the leaves, which Lobel had formerly set forth, taken as it is likely, to the life of the viewed plant, how soever it hath beene since misliked by many others, who since his time have not obtained the like to see againe, yet that hindereth not much the verity of the thing, no more then the relation of Hondius the younger, of a white flower of this kinde, which wee have not as yet seene neither.

Delphinum five Conjolida regalis latifolia.

Larke fourres with broader leaves.

Nafturium tudicum. Indian Crelles.

CHAP. XXV III.

Paonia. Peony?

Lthough in my former Booke I have shewed you some sorts of Peonies, which were the male, two sorts of double, and three of the semale single, yet not all that are extant, those that wanted there shall be supplyed here, with the Vertues more largely amplyfied. Of the male kinde I know but one fort, which is single and not double, how soever Bester in borto Eystetens, erroniously hath entituled many therewith, wherefore I thinke it not amisse to give you the figures of both

forts, that the relk may be knowne by them.

1. Peonia femina Hispanica pumila. The Spanish dwarfe Peony.

This dwarfe Spanish kinde as Clusus faith, rose with him from the seeds he received thence, growing with leaves that were more finely cut into divers parts and more pointed also, greene on the upper side, but not shing as others, and hoary white underneath, among which sprang stender pale greene stakes, lower then others, and at the toppes of each a smaller shower, made of eight leaves, of a more purplish colour, then the ordinary double Peony and as sweete, with many white threds tipt with yellow, standing about the middle bicornered had, which growing ripe, containeth within it, blackish blew seeds: the roote is glandulous like other semale Peonies but smaller.

This hath fundry diffected leaves riting from the roote, which hath many long clogs hanging thereat, as other forts of female Peonies have parted into three divisions, each producing three rounder pointed short leaves then any other, cut likewise in on the edges, of a pale greene colour on the upperside, and woolly or hoary white underneath, so neerely representing Columbine leaves, that it will soone deceive one that is not well verift in the things, Clussus said therefore could not describe them; signified unto him that it was a kinde of male Peony: but I thinke hee watherein deceived, the forme of the rootes being as others of the female kinde, contradicting that opinion.

3. Peonia femina versicolor. The party coloured Peony.

The difference of this from the others consistent chiefly in the flowers, which are sometimes of a pale red, and sometimes of a deeper red colour wholly, and sometimes parted with both these colours, either to the halves, or with stripes and veines.

4. Paonia semina Lencauthemos & Ochranthemos. The semale white and pale yellow Peony.

Both these forts of Peonies I must deliver you but upon trust of others sidelity, that have related them, the white

Bb bb bb 2

Peony

1280

Peony having two witnesses, the one Bellonius in his Observations, the other Honorius Bellus, each of them at Peony having two witnesses, the one actions in the Country and Hours and Aller and telling that in the Mountaine Ida in Candy, there groweth in great plenty, a white Peony, and Hours in Belling that testing that in the Mountaine 164 in Canaystucie growers and provided in the whole Island there is no other fort of Peony to be found, but yet is a promisenous or doubtfull fort, and yet in the whole Island there is no other fort of Peony to be found, but yet is a promisenous or doubtfull fort, and yet in the whole Island there is no other fort of recons to be tound, one yet a property of acutorium fort, and yet since their time we have not heard of any hath enjoyed one of such a colour, unlesse Bester in borto Essens Entering faith that there which reastly the Essens Esse fince their time we have not heard or any math enjoyed one or would be come be for in varie Efficient should meane it that he calleth Paonia mas flore also. But Comerarise faith that that which passeth under that it. should meane it that he callets reome man jore more. Due to make the afaint blush colour. For the pale the is not perfit white, but whitish with some rednesse among it, which maketh a faint blush colour. For the pale tle, is not perfit white, but white in with four requirements among it, white Lantigrave of Heffen his Garden, but yellow, Camerarius also faith, that one by such a name he had out of the Lantigrave of Heffen his Garden, but yellow, Cameraria allo latin, that one by ment a manufacture yet to this time that I write this, can I hear of any that hath it, but words enough I heare.

iny that hath it but words enough i mare.

5. Beonia femina promifena. The doubtfull female Peony.

Because the leaves of this Peony have some resemblance to those of the male, it caused Lobel to entitle it Pro-Because the leaves of this reconst have found to the terminance of the state of the miscua sive neutra, saying, it you benote what growes above ground, you were a man, out if the rootes underground, a female, and saith that Pliny made this the man, but Dodonam referreth it to the other fort, rootes underground, a remaic, and rath that a try which hath longer and smaller rootes, calling it femina altera, whereby it is plaine that one of them was deceiwhich hath longer and imatter rootes, caning it jet figures in Lobel, for that figure in Lobels Icones, that bearen the title Promifena is the first female in Dodoness, which hee faith was most common with them, as it is with as, the other being brought in afterwards, which I thinke doth neerer refemble the leaves of the male, let the judithe other being of ought in arts was a state of the construction of the state of th ra, to be the most common, yet surely I can not finde it so with those plants, that are the most common semale in our Country, and so he doth Befter his errour of divers forts of the male, and of divers colours, and the white one likewise, among the rest, which he calleth Peonia mas flore albo : but as Dodoneus sheweth, Dioscorides doth plainely diftinguish betweene the male and female Peony, first by the leaves, the male to be whole and not divided, but like unto those of the Wallnut tree, and secondly in the rootes, that they are single and not glandulous. as is the female, which truth will atterly confound both Befler and Banhinus opinions therein, and Lobels and Comerarius also, to make any promiscua, all the other forts shewing themselves to be semales by their rootes. 6. Peonia femina si aplici flore & pleno, ex semine floris pleni rubri vulgaris Clusio nata,

Certaine fingle and double female Peonyes, that fprang with Cluffus of the feede of the double red. Clusius faith that having in fome yeares feede from the ordinary double red Peony (which is not nituall) be fowed them. and within three years he had plants that bore flowers, tome fingle and fome double: of the finele forts, one bore flowers for colour most like unto the mother, but was single, consisting onely of six leaves, as the ordinary female doth: Another bore a larger flower of eight leaves, whose colour was of a deeper red, drawing fomewhat to blacknesse: A third bore a double flower, as great as the mother plant or greater, and of the same colour : but he had also as he saith another like the mother plant in leaves, &c. whose flower was double, but lesser and not to thicke of leaves, the colour whereof was of a deepe red, being neere the bigneffe of the double blush, having some blacke veines in those leaves that grew in the middle.

> Peonia famina vulgaris flore simplici. The ordinary finale female Peony.

Paonia famina flore pleno purpures. The ordinary double red Pcony.

7. Paonia femina flore pleno carneo major. A greater double blush Peony. From Count Aremberg, and Iohn Boifot, persons worthy of credit faith Clufius, I received intelligence, that at Brussells in the garden of the Lady Tisenac, who was the Presidents Widdow, they saw growing a blush double Peony, greater then the ordinary, and as great as the ordinary double red, yet holding the naturall property of the other double blash flower, which is to grow whiter by standing, and to hold the leaves without shedding for along time.

The Place and Time. The places of the most of them are declared in their titles, or descriptions, and their flowring, &c is about Maj; with the other forts.

The Names. It is called in Grecke mutoria ed yourund a, in Latine also Paonia, many other names are given it both in Greeke and Latine as Pentorobos, (yet some have it Pentoboros) Orobelion, Hemagogon, Paonion Pathiceraton, Theodonion; Selmon, Selenegonon, Pthifis, Aglaophotis, Idem dallylm, and some others: in Latine also Rosa farnina. Herba Cafa, Haffaregia, Rosa agnarum, and Glycyfide or Dulcifida, from the red graines in the P mgarner, called Sida in Greeke, but Peonis from Paon, that famous Phylician in his time. And Aglaophotis from the thining rednesse of thered graines or feedes, from whence fo many fabulous and detestable illusions of Alianni his Aglaophotis, and Isophin his Baciaru are referred and reported of Peony, as may be seene in the Writings of the Auncients Tragus heweth that in his time the male Peony rootes were fold for Distannia albus, but I thinke Tragus was therein decived, for I verily thinke they were the same white rootes which now are taken and called Dittamnas albas. when they are the rootes of the Frazinella, as I shewed before in that Chapter, for the rootes of the male Peont trenot so white as they, which confirmeth me the more herein, because Tragm saith, the leaves of that Peoply which be tooke to be the male, had leaves like an Ash, or Licoris, and such are the Fraxinella leaves, which also himselsedescribeth reasonable exactly, in the seventh Chapter of his first Booke, with Dictanus Cretenfis, but much mistaken in the fent to be like Cinamon, unlesse it be divers in the Rhyme tract from others. And I have liewed before also, that we want not couzeners, and deceivers, to sell the white rootes of the greater Denanthe, for white Peony rootes. There needeth nor any further explication of these forts of Peonies, fince Clustum hath undemention of all save one, and that Camerariss in borto, and Relieniss doe expresse, which is the fourth. The trabians call it Feonia, the Italians Peonia, the Spaniar de Rosa del monte, and Rosa Albardeira, the French Pivoiss, the Germanes Peonion Rofen, Beneditten Rofen, Pfingft rofen, Kiinigs binmen, and Gichtmures, the Datch Picenen bade Mast bloemen, and we in English Piony or Peony. The Vertues:

It is faith Galen of thin parts, and drying yet not very notably hot, but according to our owne fyrimetry, of configurion, or rather a little botter, an altringent quality alfo, with some sweetenesses it hath, and some acrimony likewife, and bitternesse joyned together, whereby it is effectuall to procure womens courses, if the bigge-Bbbbbb 3

TRIBELS nesse of an Almond, in powder be taken in honied Wine: by the acrimony and bitternesse therein, it is good nesse of an Almond, in powder be taken in nonica wither by the actiniony and backetine interests, it is good to open the obstructions of the liver, and kidneyes, and the yellow jaundise and from: and by the astringent que, to open the obstructions of the liver, and kidneyes, and the year of parties of the liver, and kidneyes, and the year of the decoction thereof be taken, that is made with the liver of the lity to ftay the fluxes of the belly; but the more effectually it the decedent in the fluxes is made with harfn or red Wine: by the notable drying quality therein allo faith he, I doubted not to help children there with that had the falling fickmeffe, by tying it about their neckes. And indeede I faw a childe freed from that that had the falling fickmeffe, by tying it about their neckes. with that had the falling fickmefie, by tying it about their neckes. That independ a new a cause freed from the difease, that had for eight whole moneths together, worne a good peece of the roote about him, and that as some as that peece by some chance fell from about his necke, or was taken a way for tryall of the matter, he fell into as that peece by tome chance ren from about his netner, or was caned away to the control well in the difease against but having a fresh one applyed to him agains, he became pertectly well is the reason whereof may be, that the opities thereof drawne into the pores by the inward heater, and outward aire period the plant. of may be, that the opitus thereore was necessary of the form of the faces Cyrendem, the places, effected with the discase, and tured it: for after the same manner doth the Success Cyrendem, the places, effected with the discass of the same and the sam if divers threds dyed in the purple inn colour, be bound about a viper of an arrange and they afterwards bound about their neckes that have fwellings or other diffeafes in their neckes and thousand they afterwards bound about their neckes that have feelings or other diffeafes in their neckes and thousand the same and have a present the same and thousand the same and and they afterwards pound about their neckes that have twentings of bath, not onely found. Galous provinces doe marvailously helps them: their be Galous words: but our age hath not onely found. Galous provinces doe marvailoutly neipo them: there be words a bac out ago another and the temple not dry, if you meane it should doe good) is to be hanged about their neckes, and that the decotion thereof is not dry, if you meane it thould ace good, because named about the investigation of the diffeate be not groupe to be taken inwardly, to make it the more availeable, and that also in older persons, if the diffeate be not groupe to be taken inwardly, to make it the more availeable, and that also in older persons, it rise disease be not grown too old and past cire, for whom the roote of the male kinde washed cleane, stamped somewhat simil, and laid to infuse in a sufficient proportion of Sacke for twenty foure hours at the least, after stained, and given full and last, a good draight for fundry dayes together, before and after a full moone, current that sicknesses, it there be a due and orderly preparation of the body afor chand with poset drinke made of Betony, &c.; as the learned Physitian can best appoints: the roote also is effectuall for women that are not sufficiently cleansed after child-birth, and for such also as are troubled with the mother; for which likewise the blacke seed being bearen to powder is and for such also as are troubled with the morner, for which like which the black also taken before bed rime, and in the morning also is very effectuall for such as are in their sleep troubled with the disease called Ephialtes, or Incubm, which Pliny calleth suppession notitions, we usually call it the night mare, which is a suppressing both of voice and breath. and oppressing the body as it were, with some heavy burthen, striving to be eased thereof, but seeming not to be and oppressing the body as it were, with some nearly out then, this ring to be eased thereof, but becoming not to be able nor to call for helpe, Melancholly persons being for the most part subject to this disease; it is also goods-gainst melancholly dreames, Mattholus donbeeth whether our Peony, be that which Galen used, because many paint metanchoisy dreames, Maistensian doubteth whether our reony, be that which Gaiss uses, because many Phyfitians as he faith in his time failed in the tryall thereof on young children, and I am in doubt that Tragm his male Peony spoken of here before; was that which they used, and then no marvaile if it proved not effectuall as they expected, yet faith Mathiolus our Peony seedes is availeable to reflore speech to those that have lost in if this they expected, yet faith Mathiolus our Peony seedes is availeable to reflore speech to those that have lost in it this they expected, yet later naturates our reconstituents available to retroit special to those that have four in thirther ty graines husked be made into powder and given in Wine: it is also faith he, good against the bitings of Services. ty graines mixed be made into powder and given in venie. It is allocated it, good against the bitter place, which thing Tragm faith of his male Peony, which as I shewed you before, is the Fraxinella. 'The destilled water or Syrupe made of the flowers, worken to the same effects that the roote and speede is applyed before, although more weakely. The male kinde being so sare a plant and possessed but by a few, and those great lovers of rarity in this kinde, and the Female being morestequent, the one is usually put instead of the other.

CHAP. XXIX.

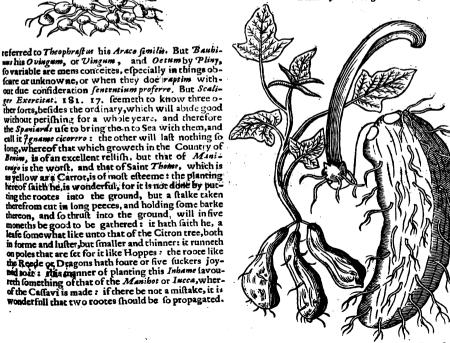

Pappas five Battatas. Potatoes.

Here are divers forts of rootes that are called Potatoes with us, serving for foode or delight, more then for medicine whereof all that are truely knowne to us, what face or forme of leaves and flowers they beare are expressed in my former booke: there are many more of the same quality; besides others that serve in stead of bread, familiar to the Natives both of the East and West Indies, whose names onely are extant in those Authours Workes that have written of them, without any further declaration either of forme or any property, but that the rootes are eaten by them, some being of better talte then others & longer lasting, among whom as I take it the Igname or Inhame, is a principall one, whereof Scaliger first, and Clufim afterwards, have given us the best information. Clufim taying it is also called by some Cametes, A. motes and Aies. All he faith of it is this, that some Portugall Ships that were taken by the Hollanders, had divers of these rootes in them some bigger then others: for some as he saith were as bigge as ones arme, and of a foote long or more, others leffer, and some thicke and short having some small tubers thrulting out at the lower parts of them, but all of them covered with an uneven and rugged barke, with many fibres at them: the substance of the roote within, being white, foft, sappy, tender, and as it were kernelly, and of no unpleasant tafte (that is the raw roote for he faith he tafted it) at the first, but a little rough and sharpe afterwards : but being rosted under the embers it tasteth more tender then any Chesnut, and somewhat like a Peare, but saith he what stalke or leafe it bore hee could not understand of any : onely he faith he received one that was sent him that had a sprout at the head of it, which was broken off in the carriage, as the figure here expressed it is unto you, but Libel in his Adversaria, laith he understood that those rootes of the Inhams, that were brought from Ethiopia and Gainey, bore Mallow-like leaves (and differeth from those of Spaine, and the Canary Islands, which are our ordinary great Potatoes) and such like leaves doth Lugdmensis give to an American plant called Hasich whose roote is somewhat like it and earlies the state of the Canary state of the state of dible. Clufine also speaketh of another fort of these Inhames, which as he saith some called Team Pern, but the Portugals Inhame as the former, which although it were like the other, yet the barke was more uneven, and lone as it were some knobbes thereon, with small sibres going from them, and from the head of the roote, went but hard great stringes, of a soote long, which were prickly for the most part. Cluston seemeth to referre the Virginia Potatoes, to the Arachidna Theophrass, and Lagdanensis saith some did the Manihes, and that this subsections are secured to the secure the subsection of the subsecti

Battalas Occidentalis India & Ini ume Orientalis Lufitanorum, The West Indian; and the Negros Potatoes,

CHAP. XXX.

Rosa Hiericontea. The Rose of Hieriche.

Here hath beene observed two sorts of this small plant, called the Rose of Hieriche, the one accounted wilds fort, and yet the one groweth in as barren places as the other.

1. Roja Hiericontea valgo della. The vulgar Rose of Hiericho.

The Rose of Hiericho is a small bushy plant growing full of wooddy brittle branches, set in a round compasse, and sundry small leaves on rhem, farre lesser rhen those of the Willow, and more neere unto the Private Rofa Hiericontea.

foure white leaves growing out of long huskes, wherin afterwards is contained two small seede, the roote is long and wooddy. This is faid to fmell fomewhat fweete, but I could never finde it fo, and to talte fomewhat sharpe.

2. Rofa Hiericontea (ylveftris, The wilde Role of Hiericho.

The wild fort groweth in the same manner, as the former, but the wooddy stalkes are stiffer and harder to breake, and hath (as it is faid) neither imell nor tafte. The Place and Time.

Both thefe forts grow in Spria and Arabia, as Bellouiss and Ranwolfiss have observed in their travailes. The Names.

It is called Rosa de Hierirbo, and Hiericcontea, and Rosa Maria, by all that have written of it, (the Monkes as Bellonius faith, being the first inventers, of the name, and of the superstitions they added to it, when as he faith he found none hereof growing about Hieriche, but onely in Arabia, in the defart land neere the red Sea) except Cords and his Father before him, who tooke it to be Amomum, but faith Anthonius Musa contraryed that opinion for divers respects, and yet hee contumationfly would uphold his fathers error, which sheweth how necessary it is to see the face of things growing as Camerarius and others, who having fowne the seede, doth say it doth in some fort represent a Thlashi, having but a little sharpe talle in the branches onely and roote. Rauwolfiss faith he found the other

fort in Syria, growing among the rubbish, and on the houses, and therefore called it a wilde kinde. Cordus to put a distinction betweene these two sorts, called the former Amonum, and the later Amonu, comparing and firting the description of Amonum in Dioscorides, uno the forme and parts thereof, yet how like foever he would make it, it commeth farre fhort of the true Anoman, as it is well knowne now adayes. Gerard on the contrary fide would referre it to a Heath, who is as farre wide

The Vertues.

It is not found usefull in physicke for any respect that I can learne: this onely property is in it, that how dry foever the plant is being brought from beyond Sea, yet if it be fet in water for a while, it will dilate and open it felfe abroad, that all the inward parts may be distinctly observed how it groweth, and although the leaves are all loft, yet the feede and the veffells remaine, from whence if it be fresh, the feede taken hath growne, and will close up againe after a while, that it is taken out of the water, not as the superstitious Monkes, falsely fained that it did open miraculoufly, that night that our Saviour was borne, and that it would doe fo in what house soever it is, when the woman with childe abiding therein, thall be necre her time of delivery for with moyfture as I faid it will open, and not without it.

ARBO-

ARBORES

FRVTICES TREES AND SHRVBS.

CLASSIS DECIMASEXTA. THE SIXTEENTH TRIBE.

CHAP. I.

Quercus. The Oke.

TRIBE 16.

N this Classis, I am to shew you all those kindes of Trees, whether they be tall and great, or lesser, usually called Shrubbes, which grow naturally in these Countries of Afia miner, the hether part of Africa, best and longest knowne to us, and Europe, and that have not beene dispersedly already spoken of heretofore: For the infinite kindes that grow in Asia major, the East India, and America, the West India, besides that we want the knowledge of the most of them; would furnish a capacious volume by themfelves: and therefore in my last Classis I will onely give you a hint of some, either of best use, or best knowne, and in this, as I thinke is fittest, begin with the Oke.

The Trees that beare Acornes, called in Latine Glandifere arbores, doe compre-

hend five severall kindes. which are Quereus, Ilex, Suber, Smilax Arcadum gleudifire, and Phellodrys, and for want of fit English names to fort unto each, we are forced to call them all Okes, and to distinguish them, give them severall epithites, according to their qualities. The Querens or Oke is parted aguine into five forts, all of them having divided leaves, called first, Platyphyllos Latifolia Quercus, Hemeris five Etymadry (Veriquerens or Robur, Phagos E [culus, Egilops Cerrus mas vel majore glande, and Haliphleas Cerrus femi-us five minore glande: Of these and their severall species in this Chapter, and of the rest in the succeeding, every one in their order.

I. Quereus latifolia. The broad leafed Oke.

This Oke, which as I take it is the most common in our Land, groweth to be a great tree, and of long continue ance, especially if it grow in a fertile soyle, the truncke or body whereof is covered with a thicke rough barke, full of chops and clists: the armes or boughes likewise are great, dispersing themselves farre abroad, and bluntly cutin or gashed about the edges, smooth, and of a shining greene colour, whereon is often found a most sweete dew formewhat clammy, and upon divers of them are found growing a round spongye substance, called an Oke Apple, whereof I shall speake more hereafter, among the forts of excressences. It beareth small, yellowish mossic flowers, standing close together upon long stalkes, which wholly fall away in the beginning of the Spring. The fruite or Acornes rising up in sundry other places, upon short stalkes, two or three for the most part joyned tother, whose outer rinde or skinne is browne being ripe and tough, the lower end being set or placed in a small rough hollow cup, the nut or kernell within being hard, cleaving into two parts, and of a reasonable sweete taste. The rootes are great, and spread farre and deepe, some thinking that they runne as deepe into the ground, as they grow high above it. The timber or wood is firme, strong tough and yellowish, with a smooth great graine, yet moother and firmer in some places then in others, being the most durable either above ground or under, on the land, or in the water, beyond any other kind of timber almost, and enduring both moisture and drongth above all : the outer part being called the sappe, is as all know whiter and lesse durable.

Some have made one or two forts more of this kinde, one with greener, yet more hairy or woolly leaves, and with fo many deepe cuts therein, that they feeme as curld thereby; another with a shorter leafe and more jagged diese at the bottome, both of them with smaller Acornes then the former. Classus also saith that he found a dwarfe species at the bottome, both of them with smaller Acornes then the former. Classus also saith that he found a dwarfe species winde hereof most likely, not farre from Lishborne not above a foote high, bearing broad leaves with sharper together with the saith also that on the his neere the Straights or Hereales pillars, there are some growing that hold their green Semper villars and those there are the straights the same to be some on the days and those there exists. leaves all the Winter, and Datechampim reporterh the same to be found on the Apenine hills, and those that are rest,

1. Querius n. ffras floren & fructum ferens. 1. Dierem bumili.

2. Roba: Cum Gallamajore rugofa. The greater rough Gall of the Gall tree.

2. Galla major altera lanis. Another great Gall that is imooth, of the Gali tree.

by that is thrength, and the other because it especially beareth Galles) groweth not so high or great as the forthe florest and more crooked, yet spreading faire branches, set with long leaves like the former, but more min on the edges, and hoary underneath : they flower and beare Ackornes like the former, but not fo plentibil and are greater, standing on longer stalkes, being sweeter also, besides which Ackornes, it beareth also a round by Subtrance which is called a Gall; the wood or timber hereof is hardly to be bored.

of this kinde there are divers forts fome growing much lower then others, fome having their leaves leffe cut ingrigged on the edges, and some bearing more flore of Galles, others no Ackornes at all, some againe beare Gast die ger Galles, other smaller, some knobbed or bunched, others smooth : some of one fashion, others of another, and verse delaw fome white lome reddiff, others yellow, and fome small and greene, which is the Omphacitie;

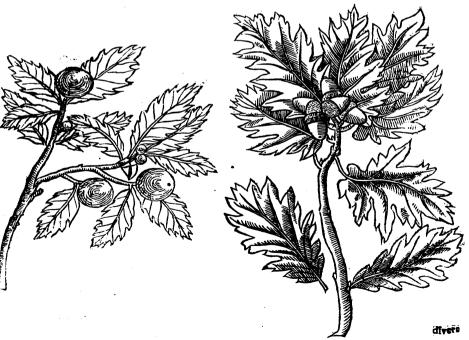

3. Thagas five Efenius. The tweete Oke.
This fractee Oke catled in Latine Efenius (ab ofca vel ab ofn because the Ackorne is the sweetest in talte, and fitel to becaten of any) hath a fhort truncke or body in comparison of the first Oke, and like unto the Gall Oke; gowing with chicker and more bushing branches, full of leaves which are thicker and narrower, and with more tourste gafhes, of a darke greene colour on the upper fide, and whiter underneath: the Ackornes grow feldome reo together og a fhort thicke stalke slenderer, more pointed and sticking faster in the rough prickly cuppes mbe middle of ghem, but as I faid is the sweetest of any other, comparing with the Chesnut, when it is rosted or folgad in many places in Spaine, serve for the poore to feede on as their daily food, and the Rich for junkets at totage in many places in a paint, here to the poore to recue on as the total yrous, and the kent for junkers at the subjects we with fruite of all forts, according to the time of the years, and will as much intoxicate alters the basine as Darnell in bread. There is another differing forthereof, whose acknown is greater, and will more glande the early fall out of the cuppe, by reason of the heavinesse of the Arkorne. They have in Unginia a goodly tall Oke, fore, which they will be white Oke, because the barke is whiter then of others, whose leafe because it so neerely retealleth this favecte Oke, I have joyned with it, the Ackorne likewife, is not onely fweeter then others, but by Vitalian byling it long, it giveth an oyle which they keepe to supple their joynts.

A. Egilop five Cervin mas. The male bitter Oke.

The male bitter Oke to called of the extreame bitternesse of the Ackornes, seldome groweth neere any habita-

bleplaces, but most usually in great woods, and rifeth up with a tall straight body, spreading large armes and brande, whereon grow thicke long leaves, with deeper gashes therein then in any other : the Ackorne is small short adding, and very bitter, almost wholly covered in the rough state thanke, which is set with sharpe prickles, of a spain solour a the wood or timber is strong it is stand upright, and devable being kept dry, but in that it is of a loser substance it quicklyer rotteth, yet is a six fewell for coales and the fire, if it doe not require any great heates

2. Galla minor. The letter Gall of the Gall tree. 3. Phagus five E foulus nostros & Folium Quercus albe Virginiais; The sweete Oke, and a lease of the white Oke of Virginia;

CHAP.I.

4. Agilops five Cerrus mas majore glande. The male bitter Oke.

5. Haliphloos frue Cerrus faminaminore glande. The female butter Oke.

divers through necessity eate of the Ackornes, notwithstanding the bitternesse, but they doe engender much headache: Dyers also use this to strikea blacke colour, but it will hold lesse then that which is made with Galls by much.

5. Haliphleos five Cerrus famina. The female bitter Oke.

This other bitter Oke (which from the Greeke name, might be called the thicke barkt Oke, or else from the thicknesse of the barke be reckoned a kinde of Corke tree, but that other things doe not agree thereunto)hath a reasonable tall thicke, but somewhat crooked body, covered with a very thicke ashcoloused grayish barke, having such short branches, that it feemeth as continually kept lopt and poled, the leaves are like to the male kinde, but narrower and longer, whose cuts or gashes are not so broad open being hard, rough and of a darker greene colour: the Ackorne hereof is smaller then in any other, except the Scarlet Holme Oke, hereafter set forth, and is so short that it searse sheweth it selfe out of the sharpe and prickly cuppe, like to the male kinde, and is almost as bitter, the wood

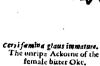

or timber hereof is loose, weake, and soft, neither firme nor strong, whereby it is the more subject to purrefaction, and unfit for building, or any other but small worke.

There is another fort observed hereof in some woods, whose leaves are not so much gashed, and the Ackornes being greater, grow three or foure together, without any stalke, whose huske or cup is as sharpe and prickely as the other of these kindes.

The Place and Time.

The first Oke is the most generall throughout the land, growing on high or low grounds indifferently, yet flowrish best in a fruitefull ground : the other kindes that I can heare of, are not growing any where withus, although there is some variety found in the timber of ours, some being of a finer graine, and smoother, shorter, and whiter wood, others a courfer graine, tougher, stronger and more coloured: but they are most frequent in Italy, Spaine, and other hot climates, their long catkins or bloomings come forth early in the Spring, and fall away for the most part, before the leaves doe come forth, the fruite or Ackornes are not ripe untill Ottober.

The Names. The Oke is called in Greeke Per, and is a generall word for all trees that beare Ackornes, as the Latines Quercw is, but more strictly taken, it signifieth this Oke, which is called by most in Greeke σλαπίσυλλ Θ, in Latine Latifolia, after Gaza. The Italians call it Quercia, the Spaniards Quenige, the French Chefne and Quefne. Della. naus calleth it Hemer's quercus quaft fativa vel vobana, and the fecond he calleth " reve frivefiris, or Rober, when

whelest Authours that I read make Hemeria to be R. bur, Gaza translateth it sometimes Placida, and sometimes Theophraftus faith that the Macedonians in hiaring called it supubseus Etymodrys, and by Gaza Veri and of lome Querens robur, and Galla arbor: the Italians call it Rovers, the Spaniards Euzina, and fome and Carvalla, the French Roble, and Roure, to Dunck Sickenboom. The third is called in Greeke 9730: Phagus and Escular, son To easily, as the Latines doe ab esca velos : Gate in translating this unto Fagus, according the done before bim, hath beene the cause why so many have erred in taking this Phages of Theophysia. the the Regus of the Latines, which inin Englift the Beach tree, when as they might plainely fee that The-Genericonath is as a kinde of Oke, and that beareth the Lweeneth Ackenes, but Fagur the Beech tree beareth dernes ture a three square not like a chassaut : The leasings call it estimate Remarks Esculo, the Samuen the Actornes Velleras, The fourth is called in Greeke Alpan &gilops, of the Mecedenians dorous, Latine Correspor Cerris as some have it, yet Winy maketh mention both of Egileps and Corresp. Some adir Corrumes, & Cerrie majore glande, in comparison of the next, Gorand calleth it the Holme Oke, and acorector letteth it fo palle, when as the Ilex Carrigere is more fitly to be fo called, because the leaves therefrench more like uned the Holme or Holly buth, then this is; the Italians call it Cerro, they of Cyprus Sie. total places in the bottome of the Seraights, call the Ackornes hereof Galliones : the Word Egiloge doth at in the a kinde of wilde Oates, as is declared before among the Graffes. The last is called in Greeke ANFANGprime florde, Gazairranflateth it Salfaerren, thinking it tooke the name from and which is fal, and only men, but the barke hereof is not more salt, but more thicke then others, and therefore it is derived from and models, a corticis crassication, the Italians call it Farnia.

the finite of the Oke is called in Greeke favar@ Balante, in Latine Glans, but both Greekes and Latine seemeheword to divers other fruites of trees, 28 46 Bahar , Jevinglans the Wall nut, and Zapolava Bahar . in Sadinia the Chefaut, and Φοιτιο Saλar . Glans Phonicea, or Palma the Date, and βάλαν . Φ μί, à μα Balanu hyphagor Glans magnentaria or Nun ben, the oylie Nut Ben, in Isalian Chiade, in Spanife Bellotae, in French nu and monte Eekel, in English Ackorne, and Maste, which yet is said to be the fruite of the Beech, and some berrees. The cup of huske wherein the Ackorno flandeth is called in Greeke outpaus, in Latine Calya glandie the Apothocaries (hops Capula glandis.

The lawer and barke of the Okes, and the Ackorne supe doe, binde and dry very much, and are somewhat cold shall but the Ackornes themselves are neither so cold nor so much binding, yea we have a generall received owonthat Ackornes in pourther drunke in wine are good to helpe flitches and paines in the fides, but they uluhurs few bay berries unto them in the taking : the inner barke of the tree, and the thinne skinne that coverethi Actorne, are most used in Physicke to stay the spitting of blood, and the bloody flix: the decoction of that breand the pouther of the cups doe stay vomitings or castings, spitting of blood, or bleeding at the mouth or briling of blood in man or woman, laskes also and the involuntary fluxe of naturall seede: the Ackornes in wher taken in wine, provokethurine, and relifteth the poylon of venemous creatures, and the decoction of and the barke made in milke and taken refilleth the force of poylonous herbes, and medicines, as also the inleacy of Cambarides, when as by eating them, the bladder is exulcerated, and they piffe blood. Hipperates in be used the furnes of the Oken leaves to women that were troubled with the strangling of the mother: and he faith he applyed them being bruised to one that had a wound with an axe or hatcher, not having any thing timeses at hand, and thereby fodered up the wound, and kept it from inflammation. The cups of the fick ornes shore bidding then the Ackornes by much in any thing. The diffilled water of the Okea budds before they bate out into leaves, is good to be used either inwardly or outwardly to asswer inflammations, and to stay all short of fluxes in man or woman. The same water is singular good in pettilential and bot barning severs, for indicate the force of the infection and alayers the extressive heare: the same water also drupks as Matthiation in the force of the infection and alayers the extressive heare: the same water also drupks as Matthiation and descriptions. in modern the heave of the Liver, breaketh the stone in the kidneyes, and sayeth womens courses the decoctiwith leaves worketh the fame effects. The water that is found in the hollow places of old Olese is very effected against any fonie or spreading scabe 1 also Ackernes saith Galen being sater are hard of digition, bessele whitestignise headache and a kinde of gliddinesse, to avoid such incopventiences they are poyled or roasted, blooding the entern, and thereby they become less winds and more pleasant, yet, he is extrain by the attimony stilliorisms and Poets, that the elder age before it kinds the life of come and broad thereby, when the elder age before it kinds the life of come and broad thereby, which is the time of the life of the was nour that they deducated it to desire the open a streng white per unterly exempt the life of them is attemy where yet urterly exempt their feeding, and the wish have their ferved to their less of an arriver ourse, as which is conserved to the proper of their feeding, and the wish have their ferved to their less of an arriver course, as which is the device, as also between the Oke and the Oke of a sail to be given a the other, as also between the Oke and the Oke of as also between the Oke and the Oke of as also between the Oke and the Oke of the other, as also between the Oke and the Oke of the other is placed in the cuppes of the weste Oke or Acorne, as Bellowing labely in his Booke of Opinity when the other is placed in the cuppes of the weste Oke or Acorne, as Bellowing labely in his Booke of Opinity and the time purpose, and I doe not think but the empanion or thicken their said in the Booke of Opinity and the first had been and other places in Torong and the leaves of the life to the labely of Egypt and Arabia, and the cheeks, the present when his placed in the labely of the Parket tree, and they of Hyris, the leaves of the Mirle ree, the leaves of the Mirle Mirle and the leaves of the Mi white leaves worketh the same effects. The water that is found in the hollow places of old Oker is very effeimiliar to ir.

CHAP. II.

Excressentia Quercuum. The Excressences of these Okes.

Here are a great many things that breede upon fundry of these Okes, some of one fathion some of other, and to in substance likewise, toft or hard, besides the Oke Apple and the Gall, whereof I in tend to focake first. I have given you the description of the tree in the Chapter last going before this tond to speake int. I have given you here the diversities of the Galles, and the good pies they are put muso for medicine, or other purposes, and I cannot understand that any of the other former kinder doe bear

Galles but those that are here set downeby the name of Robur, which is the second fort: for although divers of them have a shew of Galles, which made Pliny to say that all Ackorne bearing trees, bring Galler likewise, yes

they are but foungy balls for the most part, and none so good and hard Galles as they-

The Galles are of two forts, (mooth, and rugged or knobbed, both of them round and hard almost as wood, but all a little hollow within, and when they are dry, are either whitish or yellowish, but while they are greene and fre th upon the trees they are somewhat soft and tender, and reddish towards the Sunne side : all of them stand close to the branches, and stalkes without order, and sometimes one joyning close to another, without any stalke under them. There is also a blacke Gall as bigge as an apple, fometimes full of a Rossin like famelle, which Levis cpa- will flame being fet on fire.

The Oke apple groweth upon fundry forts of these trees, and not on any one alone, for although in our Coun-2. Tribale try ours are for the most part round and soft, being fresh and full of waterish substance, but being dryed do shrinke and are wrinckled, yet in other places some are found sticking to the backe of the leaves, and containe in them a cleere water and flyes therein, and are white, and as it were transparent before they be dry and grow hard.

Others are called Capillate, because they are all hairy, and contains within them a hony like liquor in the Spring time, yet not put to any ule.

One I had out of Virginia with round hard rough or prickly balls on the leaves.

Others are called Langue, for that within an hard huske or shell, they containe certaine slockes of wooll, which are fit for Lampes, but not without oyle or other unctuous matter as Pliny faith it will.

They that are called Seffiles grow under the joynes, at the fetting to of the leaves close to them without any stalke, the navell being white, and a little (welling forth; and sometimes of fundry colours, and sometimes blacks, and shining red in the middle being hollow within, with a putride vacuity.

They are called Foliaces, or Foliofs, that are made as it were of fealy leaves, like unto the head of the Knapweel that groweth wild abroad in the fieldes. Loc!

> I. Querens cum piluta five fun gofo fud excremento. The Oke with the Oke Apples.

Duercum Extrementa. The Okes Bxcse Sences.

TRIBE 16. Another thing groweth on the branches under the leaves, that is like unto the cuppe or huske that containeth 9. Calinte Bower of the Pomegarnet or fuch like.

Sometimes there hath beene small soft stones found like

annice fromes, yet not often feene Around thing also hath beene found, which Theophras us

which Sycaminodes, and is formewhat like unto a Mulberry. theing onely in the colour, hardnesse to be broken, and the barff tafte.

Another thing also like to the privy members of a man. hatthe yard and the sefticles.

there is againe another thing found growing thereon like wide in the beginning, called by him wads growing hard, taketh the forme of a Bulles head with a hole in it, and being broken hath like an Olive stone within it. Nitar alfoas Theophraftus faith, is made of the therof the Oke, which Pling altereth in this manner : It is cruine that the ashes of the burnt Oke is like unto Nitar, haith, Cinerem nitrofum, and Gaza tranflateth it after Pl. sinthe fame words.

The Acornes of Efentus the Sweete Oke, and of Cerrus fewishthe female bitter Oke, have certaine small stones somemes found in them either at the end of the Acorne, or on

the fhell, and fometimes in the nut it felfe. The Oke also beareth a Cachrys, which Theophraftus in histhird Booke and seventh Chapter, expoundeth to be a nund conception or gathering together of leaves, growing between the last yeares shoote, and the young bud for the sento come. Cachrys also as Dioseorides sheweth in the Chapter of Libanotis, is the feede of the fruite bearing Lihoutis, which burneth the tongue being chewed: but Plimbeing deceived by this double acception of the word, confoundeth them both together, and maketh them both but enething, (aying lib. 16. c. 8. the Oke beareth Cachry), which is a small ball that hath the property of a cauterial

medicine , but Theophraftus sheweth in the place before set downe, that the Firre treee, Larch, Pitch, Line, Nut and Plane trees, doe beare a Cachrys after the leaves and

filme, abiding on all the Winter.

There is growing on the Okes in Cilicia as Dioscorides faith in the 43. Chapter of his fourth Booke a Coccus or gaine, which the women there gather with their mouthes, and is like unto fmall Cockles or Snailes: this fee- 16. Cocks meth not the same, which he in the same Chapter calleth Coccus Baphica, and groweth on a small shrubbe,&c. as allera. you shall understand hereafter: but some learned Writers have taken them to be both one, namely the Scarlet gaine, gathered from the leffer Holme Oke: but furely Dioscorides meaneth another kind of graine, which from theule in Dying was called Coccom, and may peradventure be the same that Matthiolms faith he saw growing about the todies of great Okes in Bohemia, not farre from Poggibrot, in a Hare Warren of the Emperours, which Was neglected there and loft, but was carefully kept in Polonia, where it groweth alto: or elfe that which Lobel beaketh of in the end of the Chapter of the Scarlet graine, which he faith groweth in the middle of the leaves, and on the bodies also sometimes of Okes, which graine is bigger then the other, and is round, reddish or yellowih, and which he also faith groweth on the Okes, in the Woods by Baffill in Germany, and in divers other places of Italy, France, and Germany.

There are fundry Mosses also growing on these Okes, some sweete and some not, whereof I have spoken alreadyamong the Mosses: as also some Mushromes mentioned among the Mushromes, whereof it is needelesse to 17. Musei, frake further here: but there groweth at the rootes of old Okes in the Spring time, and sometimes also in the very heate of Summer, a peculier kinde of Mushrome or Excressence, called Qua quercina, swelling out of the enth, many growing one close unto another, of the fashion of a grape, and therefore tooke the name, The Oke gape, and is of a purplish colour on the outfide, and white within like milke, and in the end of Summer become

There is a certaine venemous Serpent called Drymus, taking his name from the place of his breeding and chiefe 20. Drymus, meth hard or Wooddy. biding, which is the rootes of Okes. Theophrastim, Dioscorides, Galen, Nicander, and Atim, have all made mentonof the wondrous venemous quality of this Worme or Serpent, and of the cure of the poylon.

whorthe wondrous venemous quanty of this working of other stands of Okes: and so doe those called Galbe, but e-21. Rance
The worker named Rance arancedine force, breed in the rootes of Okes: and so doe those called Galbe, but e-21. Rance
22. Galbe. specially on the Eleulus or sweete Oke.

There is lastly found in our owne Land, a browne kinde of Gumme growing on Okes, which Matter Edward 23, Gummi. Hafellwood found in Nottingamsbire, and fent some of it to me.

There are also found growing upon Okes, Misselto, Pollipody, Agaricke, Mushromes of sundry formes and sabhances, as Tonchwood, &c. And the two first figures expressed in the Table, are of a differing forme from others. peculiares. Manna also, or a kinde thereof, which we call in English a hony dew found more plentifully on the Oken leaves thenon any other trees : but because they are not peculier onely to the Okes, but grow upon other trees also, and that I have spoken of most of them in other places of this Worke, I forbeare further to mention them here leaving the rest that have not yotherne corrected off, to their sit places.

Their Place and Time are fufficiently expressed in their descriptions, and so are their Names also, saving that the Gall it felfe is called in Greeke xizes, and in Latine Galla, whereof one kinde fit for medicines is called Omphacitis

19. Ova quercina. The Oke grape. LI. OMOTHE 12.Genitali wirile. 13.Capai Tauri. Nuar. 14 Lapides ze Cachry

Baccis 14-

both in Greeke and Latine, not that it is an unripe Gall, but that it hath more acerbity and flipticity in it, then the greater and the yellower have: the Oke Applealio is called of most Writers Pilala Querra, Galla viridia allo. and Mollis. The Vertues.

The small Gall called Omphacitis is dry in the third degree, and cold in the second as. Galas saith, and being a sowre harsh medicine is six to draw together, and fasten saint and loose parts, so the preparation in the six repelleth and dryeth up rheumes, and such like sluxes, by staying them effectually, eigher that the start sail upon the gummes, almonds of the throate, and other places of the mouth: the other white Gall doth also pinde and the gummes, almonds of the throate, and other places of the mouth: the other water data double left then the former, by how much it bath a lefter quality of flowing hardangle in it, and in good against the differency or bloody Flixe: the decoction of them in water is of a meane attraction; but in Wine is stronger, and in harsh or red Wine stronger then it: it women sit in or over this decoction being warms, that are troubled with the falling downe of the mother; it will helpe them: the Galler themselves after the bayling. being bruifed and applyed to the fundament that is faine downe, or that hath any hot swelling or inflammation being bruned and applyed to the fundament that is faint down to that any say that is the part of the down when they are burned and quenched hot is wine or Yingar, are good to be applyed to flanch bleedings in any place, they also dye the haires blacke, and with them is made on writing incke, and the Dyers a blacke Dye as all know: the Oke Apple is much of the nature of the call, yet inferiour theseunto, but may be used in the want of Galles, for theumes, fluxes, and such other like diseases, and that to good purpose. Matthiolus reciteth a tale of his Country Italians, as Gerard doth of our Kentifs men much to one purpole, saving that Matthiolus hath it of Galles, and Gerard of Oke Apples, but both a like true, as are a number of fuch prognoticating tales, of Saint Pauls day, and Saint Switters day, and the like, which favour more of Paganism then Christianity to drive us from the confidence of Gods providence, to relye on such vaine and weake fignes, or speculations, and yet maintained Riffely by a great many, which is, that in the Gall (in the Oke Apple laith Gegala) there breedeth three small creatures, which will prognosticate the course of the speceeding yeare (in every Country) is a Flye saith Matthiolus, it p: clageth Warre, if an Ant faith Gerard, plenty of graine: it a creeping Worme be found in the Gall faith Marthialm, it foresteleth fearfity of victuals: if a white worme like a magor faith Gerarda murraine of beafts and cattle: but if a Spider fay they both there will follow a pellilence or mortality: but leaft I grow too tedious in this discourse, little pertinent to this our History of Herbes, I must passe no further, but leave it to every man as his minde is affected, and to God the Judge of all mens affections. The Oke grape doth binde all fluxes. whether of blood or humours, and preferred by some, before either Gall or Oke Apple, especially by Emeling, who is the first that I know hath written of it. Most of the rest of these Excressences are seldome used, but those that are, have the same quality of binding that the Gall or Oke Apple hath. Thered graine that is found on the Okes in Polonia, and other places, is altogether used by the Dyers, but not used in any medicine, by any that I have read or heard.

CHAP. III.

Viscum. Missellto.

Ecause the best Missellto groweth upon Okes sometimes, but more usually on other trees, I thought good to entreate hereof next unto the Gall, and the other excressences of the Oke, yet in a Chapter by it felfe, not onely for the causes before alledged, But for that there are some varieties found

1. Viscum vulgare. The ordinary Misselto. Miffetteo riteth up from the branch or arme of the tree whereon it groweth with a wooddy stemme, parting it selfe into fundry branches, and they spreading againe into many other smaller twigges, enterlacing themselves one within another, very much covered with a grayish greene barke, having two leaves set at every joynt or knot and at the end likewife, which are somewhat long and narrow, small at the bottome but broader toward the end: at the knots or joynts of the boughes and branches, grow small yellowish flowers, which turne into small round white transparent berries, three or foure together, full of a glutinous moilture, with a blackish seede in every of

them, which was never yet knowne to fpring, being put into the ground or any where elfe to grow.

Camerarius maketh mention of one fort hereof, that had many more berries growing together at a knot, then

the former, but not to differ in any thing else.

Clusion and Bellonian have each of them recorded in their writings, to have found Missellto growing on Olive trees in sundry places, both in Spaine and in Turkie, that bore red betries not varying much in any other thing, but it maketh the trees barren that hath it growing on them.
2. Viscum Indicum. The Misselto of India.

The Indian trees Excressence (which for want of a fitter name was called Missellto because it groweth on their trees) doth as it were runne or creepe upon the boughes, thooting up finalry whitish greene stalkes with foure or five joynts thereon, like to those of Grasses, but without any leafe at them, saving at the very toppe, where growth one large leafe like the Missellto leafe, but twice as great thicke and fieldy as it, with fixe round circles on either fide of the middle ribbe toward the upper end: from the bottome likewile of each of these leaves risch up a long spiked head of small leaves as it were, which abide greene all Winter long.

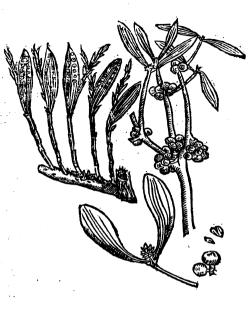

3. Viscam Persylanam. Milfellto of Pers.

This other strange plant also, that is referred to the Missellto groweth like a bush of small rush like springes with broad scales foulded one over another at the bottome, as broad as ones shand, where it is fastened to the branch whereon it groweth, with small rootes like those of Onions but ending in small points, all which doe encompasse an hollow reddish striped branched stalke, two or three cubits high, representing the chassis rute or eare of Oates, for the fashion, but Afelpias for the bignesse, and the silken downe with small seeds therein like Gosycs, of a salidity and the silken downe with small seeds therein like Gosycs, of a salidity and the tifh unpleasant talte like Niter, perhaps taken from the Sea aire it feeleth,

Viscus quereinus.
Misselto of the Oke.

2. Viscum Indicum & Peliceccon.
The Miffellto of India, and that with many berries together.

The Place and Time.

The first groweth very rarely on Okes with us, but upon sundry other as well timber as fruite trees, plentifully in Woods, Groves, and the like, in all the Land, but that with many berries in Germany, &c. the other two grow in the West Indies, from whence onely fome branch or other was brought by a friend. Our Miffellto flowreth in the Spring time, but the berries be not ripe untill Ottober, and abide on the branches all the Winter, unlesse the Blacke birds, and other birds doe devoure them.

The Names. Itis called in Greeke 150s by Dioscorides, and so is the Birdlime made thereof alfound it is by Theophraftus who faith also that in Eubeca it is called Stelia, and in Arcolin Hypbear : yet lib. 3. 4.16. of his Hiltory, he faith that Stelio groweth on the North fide of the Hex, and Hypheur on the South, & fo they differed one from another in some thing, which he hath no where exprest, in Latine Viscom and Viscom, and so alfothe Birdlime made of the berries, as are all these forts called by all Writers, the have written either of the two last, since Lobel, with their severall adjunctes.

The Arabians call it Debach, Dabuch and Hale, the Italians Vischio, the Spaniards Lisammdage, the French Guy, the Germanes Miftel, and Eichen miftel and Vogellem, the Duich Mareneacken, and we in English Miffellto. There are fundry controverfirstobe decided about this Viscum, first whether it be produced from its owne feed one, for many have beld that Blacke birds eating the berryes and lying in their bellissby dunging on the trees the feede hath thereby beene made the fitter to grow, which elfe is not, and to doth Pliny from Theophraftus fet it downe surdus fibi existing teest, that the Blacke birds voydeth that whereby it is brought to death, but it is face found by experience, that there is no facw of feed in that dung, they voyde upon the trees or ellewhere, being wholly altered in their bellies before the voyding, and further that Missellto groweth on trees from their owne superfluous moysture. which made Ion the Poetto call it Sudor quercus, even as Galles doe, and Oke Apperfrom other fort of Okes, and have no feede of their owne, and to this purpose Virgil fexto Ensidos faith:

Quale folet fylvie brumali frigore, Viscam Fronde virere nova, quod non fa a feminat arbos.

Theophraftus also faith that the Missellto loofeth the leaves in Winter if it grow on those trees that shed their lares then: but holdern them growing on ever greene trees, the reason whereof faith he is the tenacious humimy in the one, which the other wanteth : but the experience of our times hath flaewed that it keepeth the leaves

3. Vifeum Peruvianum. Mistellus of Peru.

1394

fresh and greene in Winter, when the trees whereon they grow have not any of their owne leaves less on them in these parts of Europe generally. Secondly about Ixes and Ixis, whether they be both one thing Disjonder cal-In these parts of surepresentative seconds, and the Birdlime made thereof by one name Ixos, as the Latines doe Viscom, as you heard before, and faith further that it is also found on the rootes of other shrubs which cannot be understood of the Miser. fore, and (aith further that it is also found on the rootes of other shrubs which cannot be understood of the Missitto, to grow from other shrubs, but is meant of that kinde of Gunme or glew called Izer Viscam, that is gathered from the rootes of the white Chameleon Thistle, as is shewed before in the Chapter of the Chameleon Thistle, but Ixia cannot be understood to be either Missilto, or the Birdline made thereof, which is called Ixer, as is before said, although Dodoneur doth much insist upon it, because the guilding of Birdline are damperous to be taken inwardly, for as is shewed in that Chapter of Chameleon; Ixia is either the roote of the blacke Chameleon This called Sales said the case of Sales said the file, which Galen faith is very pernitious, or another very like it as Columns thinketh; The Vertues.

Miffellto is hot and dry in the third degree, the leaves and berryes doe heate and dry, and are of fabtill parts, for Missellto is not and dry in the third degree, the leaves and doty and the modified hard knots, the Birdlime doth mollified hard knots, the mours, the birdlime doth mollified hard knots, the birdlime are all as third and the mours, the birdlime are all as third and the mours, the birdlime are all as the mours are all as the mours, the birdlime are all as the mours are all fome acrimony is in them, which overcommeth the difference ten parameter and months and knots, and impossible as the property to heate suddainely, but after the places of the body, digesting and separating them: but is not of that property to heate suddainely, but after some time as Thapfas doth, and being mixed with equall parts of Rossin and waxe doth molicine the hardnesse of the spleen, and healeth old ulcers and fores: being mixed with Sandarack and Ortment, helpeth to draw of the spleen and healeth old ulcers and some addaed the resurse is mortistly the formasse. The Missillar is added the resurse is mortistly the formasse. foule nailes, and if quicke lime and Wine lees be added thereunto it worketh the ftronger. The Miffellto it felle of the Oke as the best, (or of the Chesnut tree as Matthiolas faith to be as good) made into pouther, and given of the Oke as the belt, (or of the Chemit tree as Cristians and the Sand pourier, and given in drinke unto those that have the falling sickenesse, doth heale them as Matthiolus saith, and that he had tryed it and healed many assured; but it is fit to use it forty dayes together: and with this caution, that the wood after and healed many afturedly: Due it is not to use it forty unyes consumer. And want to want the wood after it is broken from the tree, doe not touch the ground, which is in my minds too superfittious, as is their conceit also, that it hath power against Witchcraft, and the illusion of Sathan, and for that purpose, use to hang a peece thereof at their childrens nockes: Gentilin Fulginas and others have so highly esteemed of the vermes hereof, the thereof at their childrens neckes: Gentita Palganas and others nave to migusy executed of the verture nereof, that they have called it Liganan faults ermis, believing it to helpe the failing ficknesse, Appoplexy, and Palie very speedily, not onely to be inwardly taken, but to be hung at their neckes, and for their armets helpe them to conceive: and faith Markels Thave knowne ignorant empericks, to weare it on their armets helpe them to conceive and faith Markels Thave knowne ignorant empericks, to have given the Birdlime made into pilles to persons to swallow insteade of the wood; and further faith that he knew the Miffellto that grew on a Pearetree, given to one that had the parts of his body drawne together, to doe the Mifelito that grew on a rearestree, given to one that has the parts of this property of the him much good and divers doe effected the Miffelito that growthon Haffeli muts, of Peares, as effectually that on the Oke, to it touch not the ground, for the falling ficknesse, to be caken in Wine. Trager fight that the fresh wood of any Miffelito bruised, and the juyce drawne forth, and dropped into the cares that have impossible that the cares that have impossible to the care that t humes in them, doth helpe and cafe them within a few dayes: the leaves are often given to cattell faith Play, to fatten them and purge them first: but if they be diseased they cannot continue load, this manner of curing them lasteth for forty daves in Summer.

CHAP. IV.

Ilex. The Holme Oke.

IF these Holme Okes there are three sorts, two that are great trees, and the third a small shrubbe. whose descriptions I meane to give you in this Chapter, and because there are divers Excessiones growing upon these Okes, which are not found upon any of the other : I thinke it sit to entreate of them in a Chapter by themselves, that so they may be the better understood of all, and I the more scope to handle them.

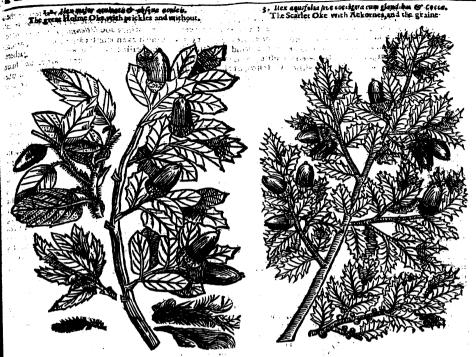

2. Ilex major aculeata. The greater prickly Holme Oke. This groweth usually to be a very great tree, yet sometimes groweth not so high, covered with a blackish red barke, as are also the boughes and branches, spreading farre abroad like unto a meane Oke: the leaves are like unto the Corke tree, but somewhat lesser and rounder, with prickely edges especially in the youngertrees, which are wholly prickely, but in the elder doe grow fmooth on the edges without prickles, greene above and grayish underneath, which do alwayss shide greene : the yellow mossie catkins stand at the toppes of the branches upon long footestalkes like to those of the Oke, and fall away in the same manner: the fruite or Acorne commeth not where the flowers flood, but in other places on the branches, upon short stalkes inclosed in a rough suppelikes common Acorne, in some places bigger then the others, and shorter also, very pleasant in some places, that many delight much to eate them a the wood or timber is of a brownish red colour and very hard, not ease for an Axe, but for a Saw to curit: the coales whereof are very durable above others: the roots groweth very deepe into the ground, and spreadeth much likewise.

2. Ilex major non aculeata. The great smooth Holme Oke. This other or smooth kinder ifeth also to be a great tree equall to the former, and like thereunto in stocke or be dy barke, branches, flowers and fruite, onely the leaves hereof are longer and narrower, pointed at the ends, and not prickely on the edges, but finely fript or deated onely, fomewhat rough underneath, and greene and smooth above: the timber likewise being as hard and heavy as the former.

3. Itex agaifolia froe Coccigera. The leffer or Scarlet Holme Oke.

The leffer Holme Oke or Scarlet Holme Oke, is a small tree in manner of a hedge cree, the stocke or body where of at the bottome is seldome bigger then of an old Rose tree, and that if it be suffered to grow without pruning: the branches are faire and many, three or foure fooce high, covered with a pale fieldful barke, hiving many snall thicke and fresh greene leaves fer thereon, but hard and very pricitivy on the edges like into the leaves of Holly, yet faire less and abide always greene as the former does in benefit yellow flowers like the other but smaller, and fimaller Acornes also, more bitter and pointed at the end, and almost wholly covered with a very sharpe prick-

أذ فأهوب أنه أن أن أن الله

ly banke or cup, but thus it doth onely when it is neglected, and not pruined and cut low, to cause it beare the Scarlet graine more plentifully, as shall be shewed hereafter, and which else it would not doe. The Place and Time,

The fast is more plentifull in Spains and France then the second, and the second in Italy where the first is scarse tound: they grow also in divers other Countryes; and are planted for the rarity in fundry places in this Land, one whereof may be some in the Kings privy Garden at White Hall, just against the backe gare that openeth into the High streete over against the Tennis Court there, which both flowreth and beareth fruite, as my selfe can winefle, who have gathered the Acornes under the tree, which Cluffun not observing when he was here, doubted to be barren: the lesser groweth in many places as, Spaine, Portngall, Italy, and Provence in France, in Africa likewise and Asia, both the greater and the lesser, as Armenia, Cilicia, Syria, Pisidia, and Galutia, in Candy also, as Billmin harh recorded, and in Virginia, New England, &c. likewite: they all flower although divers doe deny it; in Mey, and their fruite is ripe in the end of September : The Scarlet graine commeth forth in the middle of A. will, and is gathered in the end of May, and in June.

The Names.

Ilm is called in Greeke weit & quia ferra propter duritiem fecanda fit. Some called it in Latine Ilen major, and llex arbor, and Ilex glandifera, because the lesser is called Ilex coccifera or coccigera. The first is called Ilex major simple, or aculeata. The second non spinose or aculeata, and simply Ilex by Matthiolm, Lugdonness and others, and Ilex arbores by Lobel, all which Baubium transferreth to the first. Clusim taketh it to be Smilax Arcadum Theophrafti, but Theophraftus maketh the timber of Smilax to be foft and easie to be wrought on, but the timber of this is as hard as the former. The laft is called Prinos by Theophraftus, indifferently with the first, by Diofcorides nine & Baquen Coccus Baphica, and fo he calleth alfo the g. aine, in Latine Ilex aquifolia, and Ilex coccifera or (seegers, and some Phellodrys coccifers, in Spanish Coscoys, taking the name from Cusculium, one of the names given by Pliny thereunto. The Acorne of the first is called in Greek and hor, and Acylum and from hence comment the word Asylaca, which Bellenius maketh mention in fundry places to beare Acornes, in Spanife Bellesa, and A-The Vertues.

The greene leaves of this Holme Oke, as Galon faith, have a greater force to coole binde and dry, then have the terms of any other Okes: being beaten and applied they are good against loft (wellings, and strengthen weake members as Dioscorides saith: the rootes hereof bruiled and laid on the horts that the Serpent Drymus hath made, invers as Disjournes tatth: the rootes hereof bruned and laid on the hors that the Setpent Drymm hath made, invers good to reprefic the venome, and to stay the paines that come thereby. The Acornes of this Hex, which shows a calleth Arylon, and of the first Oke, and Phagm of the sweete Okesither fresh of rosted doe hinds the buly, but if they be beyled they do lesse: the young rootes boyled in wine of water, till they be ender, and then buly, but if they be beyled they do lesse: the young rootes boyled in wine of water, till they be reader, and then make more on a paleis and applyed to any place burned or scalded doth helps it: the Acornes of these greates Okes made into a paleis and applyed to any place burned or scalded doth helps it: the Acornes of these greates Okes make into a paleis and applyed to any place burned or scalded doth helps it: the Acornes of these greates Okes make into a paleis and applyed to any place burned or scalded doth helps it: the Acornes of these greates Okes make into a paleis and applyed to any place burned or scalded doth helps it:

TRIBE 16. with the Acornes of Phagus or Esculus the Sweete Oke. The Hex or Holme Oke, as Pliny and other Authors make mention, is of an eternall durability or not decaying in many hundreds of yeares, he recite those that made make mention, is or an eternational durability of not decaying in along the thirty five foote in compasse, and tachofa almost a wood alone, divided into ten bodies or trees, and contained thirty five foote in compasse, and each of a way older then the City of Bush and each of a almost a wood alone, divided into ten boules or trees, and concained chirty into social componer, and each of a large greatnesse: and of another that grew on the Vatican, that was older then the City of Romeit selfer the large greatnesse: and of another that grew on the parties, that was defined the same and of the branches of Garland that was given to a Citizen, for any worthy act in former times, was made of the branches Crowne or Garland that was given to a children of any working that was dedicated to Inpiter, the properties of the inner whereof was that bearing the inner whereof was that bear in the state of the of this tree, although are chiefly remaining in the berries, of the juyce whereof you shall heare in the following

CHAP. V.

Illicum excrescentia. The Excrescences of the Holme Okes.

Here are five feverall Excressences growing on these Holme Okes, differing from the source, and none of them found upon any of the other Okes, which are firly reserved for this place; as you shall finde them set downe in order: and first of the Scarlet graine as the most worthy.

I. Chermes seu Coccus infestiorium. The Scarket graine.

This graine or berry (is not the proper fruite of the lesser Holme Okes, for that is an Acome as the contractions of the set of the set

the others have) is a kinde of Excressence that nature thrusteth for the pon this tree, while the branches are young and not growne old or neglected and not pruined which then grow batten, and with few or none upon it, and groweth all along the branches at the fewerall joynts and footestalkes of the leaves, being as big none upon it and groweth all along the branches at the severall joynts and tootestalkes of the leaves, being as big as a Pease, of a reddish as a Pease, of the Holly, or Asparagus terries, when they are ripe or somewhat day ker, but are gathered for the most part before they be too ripe; when as they will containe within them a cleere juyce of a crimson colour, as steep as any pure fresh bloods; which by the heate of the Sunne breede small red worn es little bigger then she as the fift, but being suffered to grow great, containe the inner substance of the berry or graine, creeping away and leaving the huske or shell empty, which empty shells are the Kermes berry es that are found in the Apothecaries and Drugists shoppes every where, and which theils are the Armes berryes that are round in the Protocea was any examples every where, and which made Matthiolus who never faw them gio ring, to thinke that they were not the true Cormes of Dioscorides, but some other kinde of berry, because Dioscorides faith that they are like unto Lentils: before these are ripe, or that any wormes are bred in them, they are gathered for the Apothecaries ule, that make the foverainge cordial confection called Alkermes, which is cordi amica, and presse forth the jayer, which being boyled up with a proportion of Sugar, fit to preserve it from sowring, is kept for a whole yeare after; but when they are somewhat more ripe, yet before the Wormes are ready to breake the shell to runne away, they are gathered for the Dyers use to Dye fine Scarlet cloath withall, and are brought into powder in this manner. When these graines or beries are gathered in their fit time, they cast them on a sheete or other such thing sprinkling them with a lighe Wine or Vinegar, borne up from the ground by the sides or foure corners, and set them in the hot Sunne who seeling the heate of the Sunne begin to ftirre, and would creepe away, but that one that is appointed to looke to them with a small wand or slicke by striking the sides of the sheete causest them to fall downe into the middle againe which worke is continued fo long untill they be all dead, and dryed sufficient with the heate of the Sunne, and are afterwards brought to the market and fold to the Merchants that will buy them. Some doe this in a bagge or boulter, thaking them in the Sunne, or drying them in an oven. Bellowing theweth the way that they use in Candy, is to make two forts of Dyes of them, the one of the pulpe the other of the bladders or shells and because the pulpe maketh the richer Dye it is fold at foure times the deerer rate.

2, There is also found upon the branches of the greater Holme Oke, scatteringly here and there, and nothing so plentifully as in the other-certaine finall round graines of a darke red colour which for the most part are neglected and so soft.

3. There is likewife found a kind of grayifh Mosse made like untoa small long bush or locke consisting of grayish hoary haires but not sweete.

4. There is a gum also found sticking to the Acornes of the great Holme Oke, which is somewhat hot in talle, but not unpleasant.

5. Theophrastus maketh mention of Hyphear, to grow as well as Missellto, on the Ilex, and that on the Southside theereof, which cannot be but a differing thing from Miffellto. The Place and Time.

The place of growing of these berries, hath beene fer downe in the Chapter before and they beginne to appear in Aprill, and are gathered in May, the reft in Greece, Italy, Spaine and France, and are chicicly feene in the

The Names. The Scarlet graine is called by Theophraftus in Greeke none of overnit Coccus Phanicea, by Diofeorides xixx 9 and row & Bazind, Coccus Baphica, in Latine of Pliny, Granum, Coccus Quifquilium, Cofenlium, Scoletium, and Vermicuhum, as also Hysginum both by him and Viernvinu taken from the word Hys, whereby as Pausania saith the Galatians beyond Phrigia did call it, of the latter Writers, Coccus infectiorisus Granum infectiorism: in shoppes Granatin-Elorum, and Chermes or Kermes, and Grana kermes after the Arabian name, by the Italians Grana di tintori, in Spanis Grana de tintoreros and Granaen grano, in French Vermillon, and Graine de searlate, by the Germant Scarlackbeer, and in English the Scarlet graine, or Chermes berry. The second is called Granam fliquemm. The third Muscus Hignem. The fourth Gammi Iilgneum. And the last as is said Hyphear.

The Vertues. The Scarlet graine is used to heale greene wounds, and sinewes that are cut, to be mixed with vireger or Oxymell, and is much commended and given by the later Phylitians to women with child, who by infirmity or other casualty are subject to miscarry with their children, by untimely travell and birth; but especially the confestion which is called Alkermes, which is made of the juyce of these berryes is estectual for that purpose, and is also is the Cordial to decention and revive the fainting spirits of the heart, and to drive away melancholly instituted in allo is dayly commended and used with good affect, against the treenbling and shaking of the heart switch swondings, it is aften used six with a physicall means may effect, but there hash formerly many errours committed in the composition of this confection, first in the Lapis Lazali and the Manual Malancholly. the countries of the parties against Mclascholly), some condemning the sic of it, and some searing the same in the second of the same searing the same search of the as preparation it ought to have : a second error is concerning the filke that is appointed to be put intoit, in the preparation at ought to have: a account error is concerning the line that is appointed to be put into it, fine taking crisinfon filted dyed as our Dyesufe in, which may be dangerous in that they use divers things to strike by Dye that is not fafe to be used inwardly, and therefore some used to draw a tincture out of the dryed berries; by our later age both appointed a fafer course, namely to steepe the raw cods of filks that hath felt no art passes them in the true juice of the Chermes berries, wherewith being imbibed and sufficiently tincted, the juyce sponthen in the arthur and Oration in the fact that the first hand for the course of the chermes berries. in boyling and straining, is then fit to be used to make this confection: a third errour role from Dodonem, that mihooke Sericam, and made it Seta, whose errour Doctor Priest, that translated him into English did follow, and ave occasion to Gerard to to publish it so in his Herball, in that Gerard received that translation from Mr. Nerton minish: a fourth errour bath rifen from the Monckes that wrote Comentaries upon Mesnes, who affirmed that kinde of Crimson graine that is gathered from the rootes of Burnet is this Kermes of the Arabians, but Mathieless hath consuted their opinion sufficiently: a fifth errour is in many mens mistaking Cochenille (a cerminegraine or rather flye knowne but of late dayes, and brought from America,) for Kermes, of ancient and specall ale with the old Arabian and Greeke Writers: but now all these errours being taken away, men may safely mole confidence in the goodnesse of this confection, the faithfull preparations of the ingredients hereof, as well sofother compositions, being to carefully overseene by the guardians of the Apothecaries, since they were joyned ima corporation, that it may justly now compare (who were farre behinde before) with the most famous and coeffin the art wherefoever a the berries that are found on the great Holme Oke faith Matthiolus, being bruifed with rinegar, are good to be applyed to greene wounds and put also into those eyes that are blood-shotten doe anchgood: the other excressences are not put to any use that I know.

CHAP, VI.

Suber. The Corke tree.

F the Corke tree there are three forts observed by divers, which yet may well be reduced into two, in that the difference is not fit in my minde to make a speciall fort as you shall here,

1. Suber latifolium. The broad leafed Corke tree. The broad leafed Corke tree, groweth to be a great tree in many places, but not fo high as the Ilex or Holme Oke, nor so farre spread, but with a thicker body, and sewer boughes, yet in some places it soweth much lower, for Pliny faid it was a small tree : the leaves hereof are very like unto the leaves of the I-

kx, but usually greater, broader and more prickely then those of the elder Holme Okes, and in most places abide alwayes greene on the trees, but in fome few doe fall away, as the ordinary Okes doe, which therefore being but peculiar to few, cannot I thinke constitute another species. The flowers are like the other Okes, and the Ackornes smaller then those of the Ilex, softer also as it were spongy and more unpleasant, flanding in very rough prickly cups : beharke hereof is very thicke, rugged and full of clifts if agrow too long upon the tree, and will cleave and fall off of it selfe by peecemeale: but being taken in due time, that is every third years, the new barke will appetre very red, as if it were painted, and if any nine should happen in the barcking time, they would all wither and dye, but the Country men doe carefully obfave a fit time for that purpose, and when they have taken itsway they bring it to the fire to make plaine and flat, and latitive thereon untill it be therew hot, which then with weights they presse untill it be cold which so abideth aftriwards: the timber or wood hereof is strong and fit to taild withall, for Pling laith, it does transfifine coriem ve-influenque fentire, abide langest without seeting.

3. Suber anenfifolinm. The narrow leafed Corke tree.

This other Corke tree is like unto the former, growing to be a great tree, spread abroad with many armes and branthe which are more plyant and easie to be bowed, whereongrow longer, narrower and sharper pointed leaves them the former but not endented or prickly on the edges at all : mall other things it is like unto the former.

The Place and There. The first growesh in many places of Greece, Spaine, Per1, 2. Suber latifelium, & anguft felium. The broad and narrow leafed Corke tree.

TRIBEIG.

and France, the other fort whereof that loteth the leaves in Winter, groweth in Aquitaine neere the Pyrmen, and France, the other fort whereof that lotted the leaves in which, give plentiful then any where the Primese hills where Theophrafts did observe it to grow the other about Pifa more plentiful then any where elle in Tuf. cary as Matthiolus (aith: although Pliny denyeth any Suber to grow in Italy or France, they flower and bear their fruite later then other Okes.

The Names.

The tree is called in Greeke of Phellm, in Latine Suber, and Henfemina of some as Pliny faith. The fiftie The tree is called in Greeke wood I remay in Landing but has whose leaves fall in Winter (which Bashing by Mathiolise, Loves, and others cauch some samples of the low one of Play to be another for likewife) Suber Amaketh another species, our ne might as were man agrification by the faid Anthours. The Italian call it Sagare, quitanicum folio deciduo. The other is cancu onor angapagasana of the French Liege, but surely this is not that Liege, the Spaniards Alcornoque, and the batke Corcha de alcornoque, the French Liege, but surely this is not that Liege. the Spaniards Alcornoque, and the Darke Corena or mourninger, the Trend Lies is not that Lie that Bellomins faith the fruite is edible, the Germanes Panieffelbonis, and Ulesbons, the Darch Corke, as we doe. The Vertues.

The Corke hath a manifelt drying and binding ficulty, more as it is thought then the barke of any other Oke: the ashes of the burnt Corke stancheth any fluxe of blood, whether in men or women as Severinus saith; Quacunque finit vis immoderata cruoris.

Being drunke in Wine or any other convenient drinke. Corke is profitably used for many purposes to stoppe all forts of vessels, to peife fishermens nets, and to be put into shooes and slippers to keepe our feete warme and dry.

CHAP. VII.

Smilax Archadum major glandifera. The great Laurell Oke.

1948-22 Nto the kindes of Ilex divers have joyned this Smilax for some likenesse, but differing inmore, being unknowne to many of our moderne Writers for they still understood the Yewetree to be meint by this name, and no other: of this there are two forts, one greater and the other leffer, both which shallbe thewed in this Chapter.

I. Smelan Arcadam glandifera major. The greater Laurell Oke. This greater kinde rifeth up to a reasonable height like an indifferent tall tree, covered with a grayish smooth

barke, and the younger branches, with an hoary foft downe, the leaves are very like unto Bay leaves, or as I heophrastus saith like unto the smooth Ilex, being greene above, and with a foft white woollinesse underneath, without any dents or prickles on the edges: it beareth yellow flowers on long stalkes as all other Okes doe, and fall away in like manner bearing imall Acornes like the great Oke.
2. Smilax glandifera minor.

The leffer Laurell Oke.

The leffer fort that never groweth high, but ever remaineth like a low (hrubbe, hath longer leaves then the former, and narrower also, but as white and woolly underneath, in other things they are alike,

The Place and Time. The first groweth plentifully about Mompelier, and in many places in Italy and Spaine, the other upon the hills about the river Rhodonin, that runneth through Provence, and flower and beare fruite when the others doe.

The Names.

The old Gretians, and especially the Arcadians, as Theophraft se faith called this tree ouinag and wixag. Smilax & Milax, but they that live in those Countries now, doe call both the Tree and the Acorne thereof Acylaes, by corrupting the word away, as it is very probable, Bellonius faith that the tree, which the Cretanes call Acylaca, they of mount Athes, keeping the old name doe call Aria, keeping the leaves alwaies greene, whereby Bellonius sheweth how much we are millaken herein, for Theophrastus lib.5. c.5. doth number Aria, among the everliving trees, fuch as the Ilex that beareth Acylaca is, but not among fuch as beare fowre harsh berries, as the Service tree doth, unto the kindred whereof Aria is referred by our moderne Writers, and besides Theophrastus in his 4. Booke and 8. Chapter faith, Laurus Arie fimilis ex toto, fo that this Smilax or Laurell Oke is most likely

1,2. Smilax Arcadum glandifera major & minor.

The greater and leffer Laurell Oke.

to be that Acylaca, and their Aria alfo, and but the wood hereof is white and loofe as Theophraft in the weth, much differing from Ilex, which is firme and browne, it might be accounted a species thereof, and Glufim indeed doth referre the great Hex that he faw in Spaine, to be this Smilax and so doth Bankinn alforthe vicinity of their

anes of Smilax and llex peradventure mooving fornewhat thereunto, for Banbinus doth not account this Smilate be a proper species of Oke it selfe but putteth it among the Iliees, calling it Ilex folio retundiore molli mohow to a proper Smilar Theophrafti: the word Smilar is of a large extent, comprehending under it divers forts dues and herbes, as fift this Smilar of the Arcadians, which we therefore call glandifera, to diffinguish it by a Greenll epithite, from Taxm the Yewe tree, which is also called Smilax, but baccifera, the better to be understood: hen is there Smilar aftera, or levis among the binde weedes, and lastly Smilar bortensis of Dioscorider, which is secounted to be Phasiolas the kidney Beane,

The Vertues

This Laurell Oke is of a like binding quality with the other forts of Okes, as Galen sheweth in his 6. Booke and hind Chapter, de compos, medic, secundum locos, where he doth shew those things that are fit to use for the meane Mammations of the pallate, appointing the decoction of Mirtles and the berries to be stronger remedies then were before remembred, as also of lowre Quinces, and likewise the young and tender branches of the Ilex, Arbatus, Sailar and Phagen, which Cornarism in commenting upon seemeth to wonder at, that Galen should appoint the Sailar, which is Taxus a dangerous and deadly tree as Dioscorides and Pliny doe witnesse to be used inwardly, mithereupon thinketh that the Taxm may be lesse dangerous in one place then another, and then that to be taken, Matthiolus taxeth him for that opinion, laying that if he had taken better Counfell of his Theophrastus, with shom he was so conversant, who sheweth a kinde of Smilax that is like unto Ilex, he would have beene of a betis indgement : and Galen, as you heare placeth it with other Acorne bearing trees,

CHAP. VIII.

Pheliodrys. The Corke Oke.

although Theophrustus and Matthiolus have made mention but of one, which shall briefely be declared here.

Phelladrae alka and ACC.

1. Phellodrys alba angustifolia. The narrow leafed white Corke Oke, The first white leafed Corke Oke groweth reasonable great, and almost as tall as the Corke tree, wreted with a smoother and whiter barke then either the Corke or the Oke: the leaves are somewhat long and mirow, greene above and gray underneath, dented about the edges but not very deepely, and rather hard then prickly, the flowers and fruite are like th. other Okes, but the Acornes are of a dirker yellow colour. There is allos fors hereof whose leaves have nodents or very few the timber or wood is not to hard as the Ilex, and not to

1,2. Ph. Il drys alba angustifelia of latifolia.
The narrow and broad leasted white Corke Oke.

4 5 Phellodrys fattis Laiflinis to folijimuricatu. The broad fi greene Lated Corke Oke, and the prickly one.

2. Phellodrys

1400

2. Phellodrys alba latifelia. The broader leafed white Corke Oke.

This other white leafed Gorke Oke is like unto the former in growth, and differeth in the barke, leafe and Acorne of the tree, the leafe is white on the underfide as the former, but broader then it, and leffe hard, and leffe deated also, the barke as well of the branches as of the Acornes, are of a blackiff red colour.

This greene leafed Corke Okegroweth not so high as the former, the barke of whose branches are grayish, the leaves are of a meane sise, of a darke greene colour, and not at all white underneath, with but few snips or dents, and those not deepe, and very little prickly at the edges, the Acomes are of as bright a yellow colour as the sinft. 1.

Phellodry sings latification folia. The broadest greene leafed Corke Oke.

4. Phellodrys nigra latissimis foliys. The broadest greene leased Corke Oke.

This different from the last in the leaves, being larger and broader then the last, and more deepely dented and very prickly, but greene as it is: the cups of all these Acornes are onely rough as the ordinary Acornes, and not prickly.

5. Phellodrys muricatis foliys. The prickly Corke Oke.

The prickly Corke Oke hath a grayish barke on the body and armes, the leaves are smaller, and of a pale greens colour, deepelier dented and with sharper prickles: the Acornes hereof are like the other, but the huskeor cuppe is much more prickly then any of the 1est.

The Place and Time.

These doe all grow on the hills neere the Rhodamm in France, in Italy also by Siena as Matthiolus saith, and in many places of Portugall also, where the two former sorts doe beare Galles likewise, they keepe the same time with the rest.

The Names.

It is called in Greeke εκλοδους Phellodrys quasi Suberi querem in Latine, but Theophrasius saith it is a meane betweene the Ilex and the Oke, and therefore some did call it Ilex famina. But because the Suber or Corke tree is so like unto the Ilex, it may as well be said to partake of the one as well as the other. The first is the Phellodrys of Matthiolus, Lobel and others, and is the Phellodrys alba angustifolia folio servato of Lugdunensis, the rest are one-ly mentioned in Lugdunensis, and Pansus Reneasmus from himsthe Greekes doe promiseuously call these forts A-cylaca, as they doe those in the last Chapter The Italians call it Cerrosugars, as partaking of Cerrus, and Suber, it is not distinguished by any French name that I know of.

The Vertues.

There is nothing remembred of the faculties hereof, but as Matthiolus faith, it is of the like properties, and different not from the other Okes.

CHAP. IX.

Castanea. The Chesnut Tree.

Lthough the fruite of the Chefnut tree is not an Acorne, yet because some of the ancient Writers have affirmled it thereunto, and have given it the name of Sardinia glass. I thought it fittest to joyne it next u not them, where of there are source especial lorts, yet one is not of ours, but the new world, and thereit. Castance vulgars. The ordinary Chestut tree.

2. Castance vulgars. The ordinary Chestut tree.

2. Castance vulgars. The House Ghessus.

4.3. Coffanga Pernang, er Caffanea hamilie. The Chefinit of Peru, and the dwarfe Chefinit.

feel shall give you but abare description of the Nat, and not of the tree untill we can learne more of it.

1. Castanea unigaris. The ordinary Chesnut.

Theordinary Chesnut tree groweth very great and high, equalling many times great and large spread Okes, beliaves are long great rough and wrinckled dented about the edges, the bloomings or catkins are long and but between the Oke, but more greenish yellow: the fruite groweth betweene the leaves and the branches, the waste the end of them, inclosed within three severall huskes, the outermost whereof is the whitch wrchin pixly huske, hairy and smooth on the inside, which when it is ripe openeth it selfe, and sheweth the put being strong the one side, and round, bunched out on the other whose shell or huske is smooth browne, and shining as iwere on the outside and hair y within, tough also and noteasse to breake, within which lyest the nut it selfe, wered with the third huske, which is a thinne reddish bitter skinne or peeling, the kernell being of a firme substant and white, sweete and pleasant in taste, formed somewhat like unto an heart: the timber or wood hereof irough and of a brownish colour. Some have made divers sorts hereof greater and lesser wilde and tame, but loon to hold them differences, but as the climate causeth it.

2. Castanea Equina. The Horse Chesinut.

The Horse Chessima groweth likewise to be a very great tree, spreading great and large armes and branches; the leaves are very beautifull, set by couples, and divided into five, but most usually into seaven divisions, every me being dented about the edges: the flowers grow at the toppes of the branches, on long stakes consisting of bure white leaves a peece, the two uppermost whereof are larger then the two undermost, and have a round unpils voice coloured spot in the middle of the lease, with many vellow threds and gold yellow tips rising from the middle: the strained in rounder, and thicker prickely hu kes, the nut within this huske is mander then the other, and covered with a thicker and browner shell, and having a whitist marke or spot at the bad, where it is joyned to the outer huske: the nut within this shells white, without any such thin skin or peeling as the former hath.

3. Castanea hamilia. The dwarfe Chesnut.

The dwarfe Chesnut tree doth alwayes grow low in comparison of the former, being like in leaves and fruite mothe former, but that they grow more together, and the nuts are no bigger then Hazell nuts, having alwaies matchen one enclosed in every prickely huske, and is unpleasant in talle scarse fit to be eaten.

What manner of tree this is that beareth these Chesnuts, or what forme the leaves carry that grow thereon, is a knowne I thinke to any in these parts, I must therefore as I promised in the beginning shew you of the fruit the it is almost round, yet a little pointed toward the stalke covered with a thicke barke easie to be broken, yet lonewhat spongy, of a darke or brownish yellow colour, under which grow a number of prickles, slicking to the inner huske, that covereth the nut or kernell it selfe, which inner huske is tough and hard to breake, and continue within it a nut like an Almond out of the st. both for colour and bignesse, but of the forme of a small thinty, and of a reasonable sweete taste like an Almond or the common Chesnut.

5. Cast anea Americana Cathartica. Purging Chesnus of America.

This tree saith Monardus groweth in the Continent of America, great and vaste, whose fruite is like unto a Chesnus but that the outer huske is smooth and not prickly, nor having any rough shell, but a thin skin that both compasses the whole fruite which is almost foure square, and divided it in the middle into two parts.

The Place and Time.

The first groweth on mountaines and in woods usually, both in the South and Northerne Countries, but the wame Countries for the most part breede the greater nuts. The second groweth in the Easterne Countries of Larly, for our Christian world hath first had the knowledge of it from Constantinople. The third groweth not interior the Hillby Lyons in France, called Pilates hill, and not elsewhere as is knowne. The fourth in Peru late West Indies. And the last neere the shore of Nienragan, Ge. And flower in Aprill, after the leaves be one forth, the fruite is ripe in Autumne.

The Names.

ltiscalled in Greeke visure and ventions, Caftane and Caftanes, and Caftanes in Latine, the fruite is also so called, indephasel faltanes in Latine, the fruite is also so called, indephasel faltanes in Latine, the fruite is also some indephasel faltanes in Latine, the fruite is also some indephasel faltanes in Latine, the fruite is also so called the same six and the same six a

GHAP.10. 1402

avellana Agelechus as Athenaus faith, called it Mota and Amota : Pliny maketh divers fores hereof, asbythe names he giveth them should seeme, as Tarentina, Salariana, Meterana, Coreliana, Balaniti, Ge. When so the names he givern them industries as it is in our dayes that the French, and Spanife great nuts, that are of a freeter relish are called Marrons, which hath caused Matthiolus, Ruellim and others, to set downe two forts of it. one to be wilde, and another tame, because one is greater then another, The first is generally called by all Wri one to be wilde, and another tame, because The second is also called Castanea equina, by all Authours that have written of it, not being knowne as it is thought, to any of the auncient Writers, unlesse as Cesalpinus thinketh. written of it, not being knowne as it is thought, to any of the antenne written and the engine minketh, it may be the Myrobalanus felio heliotropy of Pliny, lib. 12.e. 21. The Turker, call it de or Adeastanes, which doth signific as much as Castanea aquina. The third is called Castanea humilis by Lagdanessis, and lohanus de Choul in his Historia montis Filati. The fourth is remembred onely by Clustus, who had it from Abramus Orielius, who received it from Benedictus Arias Montanus, brought out of the West Indies. The last Monardus called Frague Cholucogus, and Lugdunensis from him, but Caster Durantes, Castanea purgatrix, and Baubinus from him. The Cholugogus, and Lugaunenes from min, but Cast and Stebulot, the Italians Castague, the Spaniards Marrons, and so doe the French, as is before faid, and Castaignes also, the Germanes Kesten, and the Dutch Castanieboem. The Versues.

Cur Chesnuts are much of the property of Acornes, being hot and dry in the first degree, with a certaine windinesse in them, which is perceived by those that are put into the fire to rost, by skipping the cout suddenly with a great cracke or hoife, but will not doe fo if it be a little flit by thrusting the point of a knife into them, whereby the heate may expell the windinesse. Of all the kinds of Acornes saith Galen the Chesnuts are the best, and doe onely of all wild fruites yeeld unto the body commendable nourishment, yet not to be overmuch eaten, in that as onely of all wild renter years and being windy procure headache, are hard of digetion, and binde the body by an aftringent quality, whereof they pertake not a little. The inner skinne that covereth the white nut is for ftringent, that if the decoction thereof in wine or water, or the pouther thereof be taken in some convenient drink it will foone flay any fuper-purgation, or any flux of blood in man or woman. Dodoness faith that if the meale of Chefauts be made into an Electuary with hony, it is very profitable for those are troubled with a cough or with spitting of blood. In many places where there are great store growing, they fattern up their hogges with the nuts as we doe in England with Acornes, and Beech-mast. The Horse Chesnuts are given in the East Country, and so through all Turkie, unto Horses to cure them of the cough, shortnesse of winde and such other diseases. the low or dwarfe Chefnuts by reason of the unsavoury talle are not used by any: and the Chefnut of Persis not recorded of what quality it is more then that Clufius as is before faid, faith the tafte is like an Almond or an ordinary Chesnut. The last fort Monardin saith purgeth gently, and choller especially, eaten when it is fresh, or bruised and drunke in Wine, but being dryed the pouther is given in broth, and if it be rosted it purgeth the lesse: but this is to be observed faith he, that the thinne skinne is to be taken away how soever you take it, least it procure vomittings, laskes, and other daungerous symptomes.

CHAP, X.

Fagus. The Beech tree.

Ecause this tree beareth fruite somewhat like unto a Chesnut, having beene reckoned also a kinde of Acorne bearing tree, I thought it fittest to place it next after the Chesnut, both because it is found growing in woods among Okes, and that the fruite serveth as Acorne mast to fatten up swine. The ophrassus maketh two sorts, montana and campestris, the former white, the other blacke, but wee can finde no such diversity in those that grow with us. Out Beech therefore groweth to be a great and a tall tree. fpreading the boughes and branches on every fide, whereby it maketh a goodly large shadew, unlesse it be shred below to make it fpring up higher, covered with a (mooth white barke, whereon are placed many broad smooth leave, almost round yet pointed at the end, and a little finely dented about the edges, of a sad greene colour, which usually turne yellow before they fall away, and whereon are often found certaine small round hollow berries pointed at one end, greene at the first and red afterwards, wherein are found small wormes? The blowings or catkins are small and yellow, like those of the Birch tree, but lesse, and quickely falling away: The fruite is contained in a rough huske somewhat like the Chesnut, but not prickly sharpe at all, which being ripe openethit selfe into three parts, and sheweth a small three square nut, covered with a smooth soft skin, browner then the Chefnut, and under it a sweete white kernell like the Chesnut, but more astringent : the rootes grow not deepe, nor yet spread farre; the timber is smooth and white, but brittle, yet profitable to many uses.

The Place and Time. This groweth through most Woods in England, among the Okes and other trees, and is planted also in Parkes, Forrests, and Chases, to feede their Deere, but in other places to fatten Swine, whose fat will bee softer then theirs that are fatted with Acornes: it bloometh in the end of Aprill or beginning of May for the most part, and the fruite it ripe in the end of September.

The Names. It is called in Greeke & o'n Oxya, in Latine Fagus, Gaza translateth it Scissiona quad set in Laminas Scission, it is easie to be cloven: yet he also translateth the emps of Theophrassus which he numbreth among the Okes, to be fagus, whose ill sample Trages, Fuchsius, Ruellius, Matthiolus, Dodoness, and almost all other Writers thereoffine his time have followed as I said before in the Chapter of Okes, whose difference many yet have acknowledged, but none before Dalechampius have plainely detected: another errottrals hath spread among many, in taking erels or seels, Oftrys or Oftrys of the Greekes, whereof Pliny speaketh lis. 13.6.21. to be this Oxya but Pliny sheweth plainely in the description of Oftrys that the fruite or seede is like unto Barley, which they would correct, and make it to be like the Cheinut, thus one errour begetteth another: but Offrys or Offrys, as shall be shewed hereafter is rather a kinde of Elme, yet unproperly he calleth it Carpinus, when as the Carpinus of the ancients is a kinde of Maple, as shall be shewed, and Dodoness to mend the matter placeth the Offry: among the Maples, under

tename of Carpinus: but the truth is that on pos, of via and ide are three feverall trees, and Carpinus the fourth, of greatl kindes, and not to be fo confounded together. the Italians call it Faggio, the Spaniards Haia, the French for Fonfeau, and Hefre, yet Bellonius in the 52. Chap-grothis first Booke of Observations doth distinguish Hefre from Foufiean, faying that the Greekes Oftrya is The Frenches Haiftre & their Oxya the Frenches Fouftean behofthem growing wilde in the woods, upon the gomenines or hils of Sidero capfa in Macedonia, the Gerand call it Buch baum, the Dutch Buickenboom, and we in English Beeche.

The Vertues. The leaves of the Beeche tree are cooling and binding adare therefore applyed unto hot fwellings to discusse them: the nuts are hot and moift in the first degree, and meby nourish much all creatures that feed thereon. Peun Crescentisse Writeth, that the ashes of the wood is god to make glaffe. Tragus faith that he hath prooved ngood and often experience, that the water that is found inhehollow places of decaying Beeches will cure both mand beaft of any fourfe or feable, or running tetters, they be washed therewith: Ruellius reporteth that if a Viper or Adder be ftrucken with a rod of the Beech tree. difitbe but onely put unto it, it hath fuch power as to hythe Viper from getting away while it is by it: the bake of the Beech tree is so flexible, that many Country propledoe double it, with a flicke thrust through both issuthe toppe, to carry Cherries, Strawberries, and many other such like things therein, which Pliny also nomhwasufed in his time.

CHAP. XI.

Ulmus The Elme.

Heophrastus, Columella, and many also of our moderne Authours, have made mention onely of two forts of Elmes, Pliny hath made foure forts, which notwithstanding may be reduced into the former two: we have observed in the former two: we have observed in our Country three sorts, and Master Goodier a fourth, besides another very like unto them, but yet notably differing, which shall therefore bee set downe in the Chapter following by it idie.

1. Vimus vulgaris. Our common Elme.

That Elme which is most frequent and best knowne in generall throughout the Land, groweth more upright, adnot so much spreading as the rest, to bee a very great tree, with a body of a very large site covered with a thickerough barke, chapt or crackt in many places, but that on the branches is smoother, the blossomes that aphad, broad flat, whitish skinnes, which are the se debeing not much unlike to the seede of the white Garden soribin. dracks, which doe fall away by degrees, some quickely, and some holding on a good while after the leaves are bly come forth, the leaves are of a fad greene colour, broad, somewhat round and pointed at the the ends, rough and crumpled for the most part, and dented about the edges, one side of the lease next to the stalke being longer the other, and more eaten by all fores of cattle then any of the reft, having certaine small bladders or blifters thereon, which containe fmall wormes in them: the wood or timber hereof is of a darke reddiff yellow colours wisvery tough, fir for many uses, where it may be either continually wet or dry, but not enduring both so long

2. Vlmm latiore folio. Broad leafed Elme or witch Hafell. This other Elme groweth also to be as great a tree as the former, but spreadeth the branches more and falling downewards, not growing to upright as the former, the bloomings and feed hereof is like the former in al things

buggreater: the leaves hereof are much larger then it, but crumpled and rough or hard, and like unto the leaves fibe Hafell nut, from whence it became to be called Witch hafell, and hath fuch like bladders thereon as the termers the wood or timber of this is not so tough as the former, but is more short and will bee more casily

3. Vimus folio glabro. Smooth leafed Elme or Witch Elme.

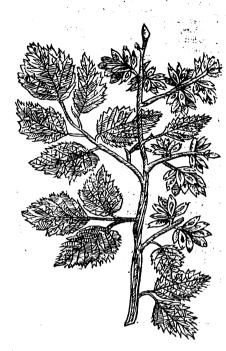

The Witch Elme groweth more like to the last then the first, in the bending boughes and great body, the blooming and seede also is like though lesse: but the leaves hereof are nothing so large as the last, but neerest in big-Meunto the first yet not rough or crumpled but smooth and plaine and without any blisters on them, as the forentwo have, the timber hereof is as strong and as tough as the first or rather more, and is accounted of workeam the fronger and more ferviceable kinde.

TI 1BR 16.

1. Vimus vuig itis cum jamiriis five jeminibus fuis.
Our Common Elme with his feede.

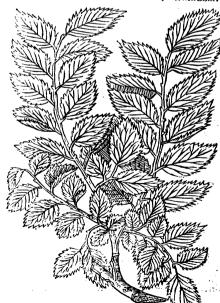

3. Vinna folio glabro. Smooth leafed Elme, er Witch Elme.

4. Vimm minor. The leffer Elme.

4. Vimns minor. The leffer Elme

There is in some places of this land found a fort of Elme som what differing from those before, in that it growthower and lesser, and with smaller leaves that are as rough on both sides as the first, and easie to be distinguishdistinguished the place and Time.

All these forts are as is said, found in our owne Country yet the first is the most frequent, and the second in some Countries as much or rather more then the first, the third is to be seen in many woods in Esta: they all blosomes is said before the leaves come forth, and the seede not long after their first spreading at large.

It is called in Greeke Asha in Latine Ulmus, Theophrassu and Columella, as I said, mention but two kindes Theophrassus, Montius Imms, or montosa Vimus, and campestrie Ulmus, Columella hath Vimus Gallica, and Vernacula, which is Italica. Pliny hath foure forts, Attinia, Gallica, Nostras, and Sylvestrie, which will thus be reduced into the woo forta his Attinia and Gallica, are both one fort, as Columella plainely setteth downe, and is the same with Theophrassus montes, which is exceptissima: Pliny his nostras and sylvestrie, are both one likewise, and the same will summella's Vernacula, which as I said is called Italica; and the same also with Theophrassus in Sylvestrie, in the same also with Theophrassus in susceptivis. So that our third fort with smooth leaves, was knowne to none of them, nor yet scarle to my ofour moderne. Writers, unlesse they put it for the Carpinus as it is usually called, or for Ormus as Trague sakhi it, as shall be shewed in the next Chapter: so that our first here set downe agreeth with the Attinia of Pliny, susla of Columella, and Montosa Ulmus of Theophrassus, and our second with the campestre of Theophrassus, was also columella, and mostras of sylvestries of Pliny, and called also satisfies by divers, but Banhinus in my judgement hat much confounded them, putting one for another, the seede of the Elme is called Samarra. The Arabiaus little Didar, Dirdar, and Lindbassus Isalicas of Dimo, the Spaniards Vimo, the French Orme, the Germanes Russis.

All the parts of the Elme are of much use in Physicke, both leaves, barkes, branches and rootes: the leaves while they are young were wont to be boyled or stewed, and so eaten by many of the common people, Marcellus with that the leaves hereof beaten with some pepper, and drunke in Malmesie doth helpe an old rotten cough to kuken falling, both Diefcarides and Galen, upon his owne experience fay, that greene wounds are healed by splying forme bruifed leaves thereto and bound upon with the barke of the Line or Linden tree, or with it owne with the leaves used with vinegar cureth the scurse and lepry very effectually; so doth the barke also in vinegar as Galmfaith, Diescorides and Columella do both fay, that the outer bark of the Elme drunk in wine hath a property to page flegme, which I know of none in our time hath tryed to confirme it: the decoction of the leaves, barke or more being bathed, healeth broken bones: that moissure or water that it found in the bladders on the leaves, while it is fresh is very effectually used to cleanse the skinne and make it faire, whether of the face, or of any other pace. Matthiolog faith, he hath sufficient tryall that the water in the blisters on the leaves, if clothes often wer the mand applyed to the ruptures of children will helpe them, and they after well bound with a truffe. The aid water put into a glasse and set in the ground, or else in dung for 25. dayes, the mouth thereof being close loped, and then the bottome fet upon a lay of ordinary falt, that the feces may fettle, and the water become vencleare, is so singular and soveraigne a balme for greene wounds, that it is a wonder to see how quickly they will khealed thereby, being used with soft tents; the decoction of the barke of the roote fomented, molly fieth hard mours, and the fat inking of the finewes: the rootes of the Elme boyled for a long time in water, and the fat riis on the toppe of the water, being cleane scummed off, and the place annointed therewith that is growne bald, with haire faine away, will quickly reftore them againe : the faid barke ground with brine or pickle untill it musto the forme of a pultisand laid on the place pained with the gont, giveth a great deale of cafe. It hath been there dit that Bees will hardly thrive well where many Elmes doe grow, or at least if they upon their first going moud after Winter doe light on the bloomings or feed thereof, for it will drive them into a loofeneffe that will till them all, if they be not helped speedily.

CHAP. XII.

Oftrys five Oftrya Theophrafti, The Horne beame tree.

His tree which as I faid before, is so like unto the Elme, but notably differing from it riseth up to be a reasonable great tree with a whitish rugged barke, spreading well, and bearing somewhat longer and narrower leaves then the ordinary Elme, and more gentle or soft in handling, resembling in some fort the Beech leaves, turning yellow before they fall, for which cause some have taken it as a kinde of small Beech: at the end of the branches hang downer a large ruit of whitish greene narrow and long leaves, being almost three square fet together, among which rise small

and heads, wherein are contained small yellowish seeds like unto barley cornes, the timber or wood hereof is wish like the Beech, but to gher and stronger then any Elme and more durable in any worke, growing as hard a hone, whereon came our English name.

Celaipinus feemeth to fet forth another fort differing in the heads of feede which in Italy are smaller and closer, Altera Italian Germany, and with us more loose and larger.

The Place and Time.

This groweth in many Countryes in this Land, where as I faid fome take it for a kinde of Beech, and fome for linde of Elme: the tuft of leaves appeareth in Inne, and is ripe in the end of Anguing, or in September.

The Name:

This trèe hath found althoft as many names as there have beene Authours that have written of it, but by the element of the best it is the spic or or the other fam, which he described for plainely in his third Booke and sin Chapter, that it is a wonder that so many learned men as have called it other wife should not better heede but led by tradition or conceit have rather taken it to be any other thing then what it is, Pliny 116, 13, 6, 2, 2, deciribed.

beame tree.

s. Tatle mes. The male Line spet.

Offrys Gue Offrya Theophrafil. The Homebeame tree.

or Hainbuchen, and we in English Hornbeame, and Hard-The Tlevener

fcribeth it but maketh it like to Fraxinus which is an er-

rour in him, when he should rather have fet Farm, for it

no way resembleth the Ash, but very much the Beeche. Tragus taketh it to be Ornus, and faith he cannot agree to Ruellius, who faid that Ornus was a species of Fraxinus Marthiolius calleth it Carpinus when as Pliny theweth that Carpinus is a kinde of Acer, yet Dodoneus, Lobel, and others, call it so after him. Dodoness also in making this to be Carpinus, he calleth it (via quif conjugation of Pliny, and Gerard doth the like verbatim, his Corrigider letting him to patte as if it were no fault or errour in him, when as the true Carpinus or Zygia is not knowne what tree Pliny meant by it, for the other Maples that are knowne. are in leaves one like another, yet Dodoneu in his Dutch Booke maketh it his third kinde of Elme, and doubteth if it be not the Vlmus Sylvestris of Pliny. Lugdunensis eivethus the figure of it for Olmus Attinia. but Cordus or Dalechampius, as I said before, as I takeir, first tooke it to be Oftrya and fo Gefner after him, and Bellenim, Thaling, Clusius and Camerarius, doe all hold it to bee the right, and fo call it, yet Gefner in hortin calleth it Fagus fepiaria. Lobel Betulus, and Clusius Fagulus herbariorum. The Italians call it Capino according to Matthiolus, and the French in thing it to be Carpinus, call it Charme and Charpene, but Clusius faith that his Country men of Arras called it Hestre, the Germanes Hanbuchen, and Hagenbuchen

We have not learned that any Author hath knowne this tree to be applyed to any Phylicall Ble, but as a wood for many necessary imployments, both for Milles and other imaller workes in good account for the hardnesse. strength and durability.

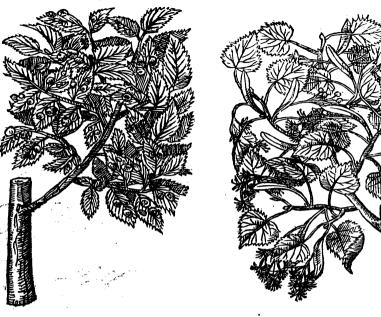

CHAP. XIII.

Tilia. The Line or Linden tree.

He Line t ee is accounted to be of two forts, the male and the female: that which we call the female is in great request, both for the large growth and goodly verdure and greene shade that it maketh, as also for the sweete sent it yeeldeth, especially in the blooming time, when as it is much pleasure torest under it belides the Phylicall vertues, but the male as it is more strange and leffe feene, to likewile of leffe respect and use, besides that many doe suspect it not to be a species thereof, but rather a kinde of Elme, it is so differing in forme and substance.

1. Tilia mas. The male Line tree. The male Line tree, groweth to be a great tree, and spreadeth the boughes largely, yet not so much as the semale, covered with a thicker barke, nothing to flexible and fit to binde things withall, because it is harder and more cafie to breake: the leaves are somewhat like unto Elmeleaves but somewhat smaller and longer, hard in handling and on every one for the most part grow small bladders or blisters, full of small wormes or flyes, which being ripe doe flye away, (but Dodoness denyeth it to have any bladders on the leaves, and that they are deceived which fo picture it, but he might be deceived therein, for although transplanted it bore none, yet naturally it might) this very seldome beareth either flower or fruite, and therefore it is held to be barren, not bearing any thing: yet when it doth beare, it carryeth round and flat huskes; many growing close together, cach whereof hangeth on a small long footestalke by it selfe, with a notch or cleft at the head or end : the wood or timber hereof is harder, more knotty also and yellower then the female, and comming neerer unto the Hone, wherengon many have judged it to be rather a kind of Elme. Banbinm maketh another fort hereof with larger leaves which be taketh tobe that which Thalism setteth downe in his Harcrinia files, to have found there wilde, and callett Tilia slee-firm sive montana, but surely I thinke it different not from Tragm his Tilia sleefing, which both he and Banbinm reckon a species of the female kinde, and therefore cannot fitty be referred to the male, because henever saw it beare fruite.

2. Tilia femina major. The greater female line tree, This greater Line tree groweth greater then the former (especially if it light in good ground, for I saw at Cobbam in Kent, a tree whole branches were led into two feverall arbours one above another, brides that on the ground under the branches, which was a goodly speciacle; and a large shadow that it yeelded) covered with a darke colonized barke, the next thereunto being very obsequency, and plane to bend and binde, having some other thin rindes within it, whereof are oftentimes made baskets, and as Belling leith, the Greeken dechotics, which being pitched or lined with melted roffin, ferve to carry which being pitched or lined with melted roffin, ferve to carry which being pitched or lined with melted roffin, ferve to carry which being pitched or lined with melted roffin, ferve to carry which is water in from place to place, as also to make cords, ropes or the like: the leaves are faire and broad, greener; finorther, gentler, and rounder then Elms leaves, but with a longer end, dented also about the edge; and of a real touble good left; at the ends of the bandches oftentimes, and from the foote of the leaves also come forth long and marrow whitelif leaves, along the mid2. Tilia famiha major. The great female Linetree.

de ribbe whereof springerh out a stender long stalke, with divers white flowers thereon, smelling very sweete after which follow small berries wherein is contained blacke round seede . Gerrard saith it beareth cornered sharpe pointed nats of the bignesse of Halell nuts, (but such I never faw) and saith that the male kinde doth best round pellete elastring together like I wy berries, wherein is blacke feede, wherein hee transferreth that to the male kinde, which is proper to the female: the wood is whitish smooth and light, the coales whereof is situlto make Gunponther withall. Arthe roger and under the old trees of this Linden, Tragus faith he some Pres imerobitryed to grow a certaine Excreffence like unto the Oke grape, whereof he knew no use.

Quesine

3. Tilia famina minor. The smaller female Line tree. This leffer Line tree agreeth with the last in all things, faving that it groweth fmaller both in body, leaves and howers, the leaves being of a darker greene colour, and beareth no fruite after the flowers, because they appeare later then the former.

The Place and Time.

They all grow on the hills and high grounds, yet for the most part in the mostler places, and are often found alhin vallies: with us the greater female kinde is planted in many places of our Land, chiefly for the large fweete hadow it maketh, and flow eth usually in May, the other are very great strangers in this Land, scarce to be seene w where.

his called in Greeke giaves Philgra, but not gravigue as Pling, that confoundeth Dieferides his Philgra, with Thephaftrus his Philyra, to called because it is brought into senues affulus five philyras fimall thin sheetes or leaves, find as in the elder times they used to write on: in Latine Tilia, the one is called mas, and the other famina by all Writers, but that Bankings addeth unto the title of the man, Ulmifalia, and further faith, that the figures there - versus, are rather of the Elme then of it. Tragm onely and Gefore in bortis, have made mention of the last, as of differing fort from the ordinary female kinde. The Italians call it Tilia, the Spaniards Teies, the Prench Tilles, Toller and Teil, the Germans Linden, and Lindenbaum, for the smoothnesse and softnesse thereof, the Dutch Linde, and Lindeboem, and we thereafter the Line or Lindentree, and in fome places, broad leafed Elme. Pliny in in Booke and 16 Chapter, the weth that among the Tibers , the Line trees were feene to beare fundry fores of finits for on one arme grew Nuts, on another Grapes, on another Peares or Figs, or Pomegarnets, and divers forts of Apples, but they all were not of long continuance.

The male kinde is quite without use for any thing that I know, nothing being extant thereof in any Amburs writings. The female is of much ule, for the decoftion of the leaves is a good Lotion to wash fore white, or that have canckers in them : the leaves also being bruiked after the boyling, and applyed to being bruiked after the boyling, and applyed to be leaves also being bruiked after the boyling, and applyed to by leaves or feere that have tumours in them by falling of humours, doth much helpe them. The inthe likewise performent the like effect; the flowers of the Line tree, and of Lilly Convally, being the likewise, the water of them is much commended against the falling sickenesse; the deltilled water of

the barke is of the same effect, and is also of very good use against the fretting humours that cause the bloody fluxeor griping paines in the belly: the said inner barke being steeped in water for a while, causeth the water to become thicke or mn/cilagje, which being applyed with clothes wet therein, will helpe any place that is burned with fire: the wood or coales of the Line tree while they are burning hot quenched in vinegar, and after wards ground with a certaine thing or drugge, called Oculi cancer and drunke, is found by good experience to be wonderfully good for those that by some fall or bruise, or by blowes doe spit blood: Tragm saith that he thinketh the showers hereof, whereon Bees doe much desire to feede are good for them.

CHAP. XIV.

Betula. The Birch tree.

He Birch tree go weth to be a goodly tall straight tree with us, flaught with many boughes and other straintes, bending downewards, the older ones being covered with a discoloured reugh chapped banke, and the younger being browner by much, under which there is another sine white thinne rinde or barke, much used to write upon, before paper was used, the leaves at their first breaking out are crumpled, and after are somewhat like unto Beech leaves, but smaller and greener, and dented

also about the edges: it beareth small and short catkins, somewhat like to those of the Hasell nut tree, which shide on the branches a long time, untill growing ripe they fall on the ground and their seede with them.

The Place and Time.

This usually groweth in woods, as well on the higher as lower and moult grounds, every where generally throughout the land, the catkins come forth in Aprill, and the leaves soone after, the seede is ripe in September.

The Names.

It is called in Greeke anuish by Theophrasim, ib. 3.c. 14 yet he giveth it to be solio Carya, and some read ingastauran is, wabut others doethinke that it should be solio Oxya, whereunto it stily agreeth, in Latine Beeula, and with some Beeula fortasse quia bitumine scattent; all Authours call it Betula. The Italians call it Betula, the French Bouleau and Bes, the Germanes Birchenbaum, the Dutch Berckenboom, and wee in English Birch tree.

The Vertues.

The Birch is in our dayes applyed to little physicall uses, yet the juyce of the leaves while they are young, or the destilled water of them, or the water that commeth out of the tree of it owne accord, being bored with an auger, or destilled afterwards, any of these being drunk for some time together, is held availeable to breake the stone in the kidnies or bladder, and is also good to wash fore mouths, a lye made of the ashes of Birch tree barke, is effectuall for the same purposes. Many other civill uses the Birch is put unto, as fult to decke up houses and arbours, both for the fresh greennesse and good sent it casteth, it serveth to make hoopes to binde caskes withall; the young branches being fiesh are writhed, and serve for bands unto faggots: of the young twigges are made broomes to sweepe our houses, as also rods to correct children at schoole, or at home, and was an entigne borne in bundels by the Lictors or Sergeants before the Confulls in the old Romans times, with which, and with axes borne in the like manner, they declared the punishment for lesser, and greater offences, to their people.

Betule. The Birch tree.

CHAP. XV.

Alnus. The Alder tree.

The this Alder, I have to shew you two or three varieties more then others have expressed, which are these following:

The ordinary Alder tree groweth to a reasonable height, and spreadeth much if it like the place, covered with a brownish barke, and the wood under it more red then Elme or Yew: the boughes and branches whereof are more brittle then any other wood that groweth in or neere water: the leaves are round almost, full of ribs, rugged, thicke and clammy, by reason of a sticking dew that continually lyest upon them, yet, simileg, and dented about the edges, somewhat like unto the leaves of the Hafell cree, but of a darket greene colour: it, beareth short browne aglets like the Beech or Birch, which fall not away before the seeds is tipe within them,

and then they are hard and scaly, a little long and round ike unto an Olive: the timber is everlasting, if it be either under the water or in a watry most place, for being made into piles it is the surest and strongest to uphold either bridge, or Luilding thereon, but it is quickly subject to the it is be kept dry. Vnder this Alder in sundry places found such a like Excressor, as is the Oke Grape, Bubium faith there is another fort observed whose leafeillonger then the ordinary sort, not differing in any thing

2. Alnus folio incano, The hoary Alder.

The hoary Alder is a leffer tree then the common fort, whole barke is whiter, and leaves likewife are fomewhat larger, greater, and more pointed then it, not fo greene mediaming on the upperfied, but hoary, by realon of the fault haires are to be freneythereon, if they be well obserted, or else not, but much more holy underneath, that itemeth to be of an all colour, the footestalkes of them allobeing hoary in like manner, the catkings or aglets bred are shorter and not for yound as the former, but mently long untill it have given ripe seede.

3. Alnus Alpina minor.
The small Mountaine Alder.

This small Alder, groweth in each part like the common Alder, but lesser and lower both in lease and other things, and hath not the leaves bedewed with so clammy amount.

The Place and Time.

Both Place and Time are in a manner fufficiently expriled in their descriptions to be designed to grow in soil woods, and in other water, place, and the last upon this in Anstria, sourcing in April or Man, and giving the least in September 2

It is chied in Greeke by Theophrass with see, but not nontioned by Dioscorides or Galen, in Latine Alnus quod name alaur, Theophrass with 3.0.14. saith this tree is

harren, Phy from him, that it beareth neither flower nor seede, and yet in the first Chapter of the same Booke is sheweth among other trees, when their fruite is ripe, that the Alder, the Wallnut, and a kinde of Peares, doe open in Attumpe, which declareth that he is contrary to himselfe, in saying it is barren: Some of the Poets sainthat the three sisters of Phaeton, after three moneths mourning for their brokkers death, whom Apollo slew with thouser for ill guiding the Chariot of the Sunne, were turned into Popler trees, but Ovid in his second booke of Metamorphofes, and Virgil in Eglogasexta, in these Verses following sheweth (yet both true alike) that they was Metamorphosed into Alder trees.

Tum Phaetontiadas musco circundat amaya Corticis, atque solo proceras erigit Alnos.

The first is called Alms and volgaris by all our moderne Writers, but onely (ressenting, who calleth it Amedamas he doth the nigra ac baccifera Avornus. The second is call Alnus altera by Clusius, but giveth Lobel his fine of the ordinary Alum for it, as the new Gerard doth also: but Banbinus in his Austrhielus giveth the true gure of it, set forth by himselse and there calleth it Alnus hirsuta. The last intensived onely by Banbinus whe same name is in the cide. The Italians call it Anno, and Onio, the Spaniards Aliso, the French Aulne, the Germus Erlenhaum, and Elernhaum, the Dutch Elsen, and we in English Aller, and Alder tree.

The Vertuer.

The leaves and barke of the Alder tree, are cooling, drying and binding: the fresh leaves laid upon tumours insolvesh them, and stayesh the inflammations: the leaves put under the bare feete of travell rs, that are surband with travelling, are a great refreshing unto them: the said leaves while they have the mornings dew on them, add in a chamber troublest with sleas will gather them thereinto, which being quickely cast out, will ridde the subtrost them: of the barke is made a blackedye, for the courser forts of things, and with it, or the greene suit instead of galles, is made writing incke, by adding gum and coperas to it.

CHAP. XVI.

Papulus. The Poplar tree.

He Poplar tree hath beene aunciently accounted, but of two forts, blacke and white, but by Plian difficults directories, the white, the blacke, and the Libian or Aspen tree, unto these I must adde two other out of Lobol, which are as followeth.

two other out of Lobel, which are as followeth.

1. Populus alba. The white Poplar tree.

The white Poplar tree groweth great and reasonable high, covered with a thicke smooth barke, and the covered with the covered w

Alum vulgaris. The utual Alder tree.

Folio oblongo viri-

of so deepe a green on the upper side, and hoarv white underneath, of a reasonable good sent, the whole forme representing the leafe of Colts footes the catkins which it bringeth forth before the leaves, arclong and of a faint reddiffi colour, which fall away like unto others bearing teldome good feede with them: the wood hereof is smooth, soft, and white, very finely waved, whereby it is much effeemed and used in many workes. Vnder this tree also is Vuapopu. found sometimes the like t've or berries that

are found under other trees.

2. Populus albaminoribus foliis.

The smaller leased white Poplar tree. This other white Poplar groweth like the former, but the branch's are more knotted then the former, and the barke more rough and white: the leaves come forth at the ends of the branches and iprigs being both smaller and leffe divided on the edges, the catkins are fmaller and fhorter, and nothing fored, but tending to a brownish dead colour.

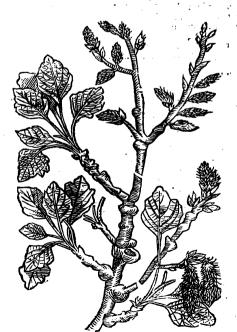

2. Populus nigra. The blacke Poplar tree.

The blacke Poplar groweth rather higher, and ftraighter then the white, with a grayifh barke, bearing broad and greene leaves, fomewhat like to Ivy leaves, not cut in on the edges like the white, but whole and dented, ending in a point, and not white underneath, hanging by flender long footestalkes, which with the ayre are almost continually shaken, like as the Aipen leaves are: the catkins hereof are greater then of the white, composed of many round greene berryes as it were let together in a long

2. Populus aibaminoribus folite. The imaller leafed white Poplar tree.

3. Populus nigra. The blacke Poplar tree.

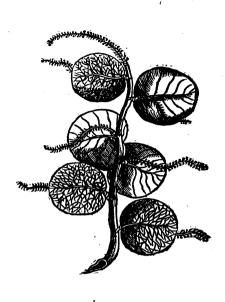

Popular Lybics. The Alpen tree.

TI IBE 16.

5. Populm retundifolie Americane. The round leafed Indian Poplar tree;

duster: wherein is much downy matter contained, which being ripe is blowne away with the wind: the eyes or clammy bads hereof, before they spread into leaves (and not of the whire, as some have thought, nor yet the Vie or berries that each of them have growing under them) are gathered to make the Vinguentum Populeon, and are of a yellowish greene colour, and small, somewhat sweete but strong: the wood is smooth tough and white, and will quickely be cloven to make thingles or cleft pale or the like. On both thefe trees groweth a tweete kind of Muske, which in former times was much used to be put into sweete oyntments, and commended by Gulen and others to be the best next unto that of the Codar tree.

4. Populus Lybica. The Aspen tree.

The Aspe is somewhat like unto the blacke P plar for the growing, but lesser then either it, or the white, and with a darker coloured barke : the leaves are also blacker, harder and rounder, then those of the other, and a little movenly dented about the edges, and in some places spotted with white spots, hanging by longer and slenderer forestalkes, which by their continuals shaking and striking one against another, make a noyse although the aire became: the carkins hereof are longer, and of a brownish ash colour, which continue a while and then fall away with the feede in it; the wood is white but nothing fo tough. This tree faith Pliny hath the best Mushromes growing under it.

5. Populus roundifolia Americana. The round leafed Indian Poplar tree.

The branches onely of this tree were brought from the West Indies, unto Mr. Morgan, who was Queene Eliwhich Apothecary, and by Doctor Lebel caused to be drawne to the life, which he exhibited in his Adversaria and Dutch Herball, the branches were a little crooked, full of joynts, at three of foure inches distance, and at each slarge perfect round leafe, without any dent on the edges, but where it is fet on the short footestalke, being thicke ranguer and broader then the leaves of Arbor Inde: at the fetting to of every which leafe commeth forth a fall long carkin like a thong compassed with many small graines much resembling those of the Poplar for which cale he called it a Poplar, the taste whereof was very astringent, somewhat heating and saltish.

The Place and Time. The foure former forts grow in moist woods, and by waters sides in sundry places of the land, yet the white is me to frequent as the other. The last is declared of what Country breeding it is their time is likewise expresto that the catkins come forth before the leaves, and ripen in the end of Summer: but it should seeme that the last but leaves and catkins altogether.

The Names. The white Poplar is called in Greeke Asuka, because of the whitenesse, in Latine Popular alba: and Farfaran of the Ancients, the blacke is called divines Populan nigra, but with Tragm it is his first Populan alla, the Afpe is taken many good Authours to be xquis of Theophrass w, because he joyneth it next unto the two former, lib.3.c.14.

ging it is like unto the white Poplar, which may breede some doubt whether he meaneth the Aspe or no, which hingo such divided leaves as the white hath, Gana translateth it Alpina, which it feemeth he doth from Pling,

TE 188 16.

The Vertnes.

who called it montana, as well as Lybica, the other are expressed to be of Lobel his declaration, and on one before him. Homer in his fifth Iliad, calleth the white Poplar a zepaida ab Acheronte, because wheen Hercules had overcome Cerberm he came crowned with this Poplars branches, which he found growing by the river triumph of that victory, and from his example, all that with glory have conquered their enemies in fight, were triumph of that victory, and from his example, an that with glory have conquered their enemies in nght, were wont to wear a garland of the branches thereof; their errour that Succinum, yellow at the gum of the blacke Poplar is for ridiculous, that but to name it is sufficient confination. especially seeing Marshiphu huh dore it before. The Arabians call the white and blacke Poplar Hamp and Haur round the Iralians Popla biance and nero, the Spaniards Alamo blanco, and nigritio, the French Abeau, and Peoplar, and Trends; the Germaner and nero, the Spaniaras Mamo stanto, and my state, and Popelier work, and We in A gife, the white and blacke Poplar tree, and the other the Afpe or Afpen tree.

The white Poplar faith Galen, is of a mixt temper, that is, of an hot watery, and of a thinne earthy effence and therefore it is of a clenfing property, the weight of an ounce in pouther of the barke of the white Poplar being dranke faith Dioferrides, is a remedy for those that are troubled with the Sciance or the Strangury, and thereupon Sapius occultus victa coxendice marbus Serenas hath theie Verles:

Perfurit, & gre fins diro languore moratur. Populus alba dabit medicos de corrice potus.

The juve of the leave: dropped warme into the eares, eafeth the paines in themselve young bourgeons or eyes, before they breake out into leaves, bruifed and a little honey put to them, is a good medicine for a dull fight: The blacke Poplar is held to be more cooling then the white, and therefore fome have with much profit applyed the leaves brut ed with vinegar, to the places troubled with the gout, the feede is held good against the falling fickeneffe to be drunke in vinegar: the water that droppeth from the hollow places of the blacke Poplars, doth take away warts, pulhes, wheales, and other the like breakings out in the body: the young blacke Poplar buds faith
Matthiolis, are much used by women to beautifie their haire, bruising them with fresh butter, and straying them after they have beene for tome time kept in the Sunne : the oyntment called Populeon which is made of this Poplar is fingulas good for any heate or inflammation in any part of the body, and doth alfo temper the heate of wounds : it is much used to dry up the milke in womens brefts after their delivery, or when they have weved their children. The Alpen leaves are in the like manner cooling, and are used for the same purposes that the blacke is, but are in all things farre weaker. Trague it seemeth putteth the blacke Poplars instead of the white, and the Afpen instead of the blacke, as his descriptions and figures declare.

CHAP. XVII.

Taxus. The Yew tree.

He Yew tree groweth with us in many places to be a reasonable great tree spreading many large branches, which make a goodly shadow covered with a reddift rugged barke, the bo-

dy, and elder boughes being more grayifh, and the younger redder, whereon grow many winged leaves, that is many long and narrow darke greene leaves fomewhat fost in handling, and not hard as the Firetree leaves are, whereunto they are compared by many fet on both fides of a middle stalke, alwayes abiding greene and not falling away in Winter: the flowers are small and yellow, growing along close to the branches, where afterwards the berries come forth, of the bignesse and colour of the Holly, or Asparagus berries, sweete with a little bitternesse, and procuring no harme to them that eate them, for any thing that I have heard: the wood hercof is reddiff tough and strong.

The Place and Time.

This groweth in many places of this Land, but planted in all whether at home or abroad: it flowreth usually in Aprill or May, and the berries be ripe in Semptember, and Ottober.

The Names.

It is called in Greeke win and owing, but of Diofcorides and Galen quinas Smilax, vet as Dioscorides faith, some called it in his time Thymalum, in Latine Taxus, and fo all Latine Authours call it, except Cordus on Dioscorides that calleth it M lax, and others Smilaz, because it was generally taken to be either deadly or dangerous to eate thereof, or under it, or to fleep under it also, which in our land is found contrary by many men & children eating of the berries without harme, it is thought that all poyfons became to be called Taxica, and by time called Toxica, from hence the Italians cal it Taffo, the French If the Germans Eibenbaum, the Dutch Ibenboom, and Bogenhout, and we in English. Yew.

The Yew tree.

The opinion of harme that this tree worketh, or peradventure some accidentall harme by distemperature, eiher by the climite wherein it is bred, or of the perfons that take it hath cauled, that there is nothing of any good per by the content of the second of the periods that take it main caused, that there is nothing or any good the periods that the second of the the is to driake much wine t but Marthelm contesteth there against, in that the berries are sweete with some himmesse, meither of which qualities portend any coldnesse to be in them, and that birds that feede thereon bemore blacke, befides the ever greenenefic of the tree, as Pines, Firres, &c., all which fhew a temperate heate to be herin, and the more, because as he faith, men that have beene drawne on by the sweetenesse of the berries to mof them, have beene driven into fevers, and laskes, by enflaming the spirits and blood, which effects come at from any cold quality. Of this tree formerly long bowes were wont to be made, which were of great acmust, as well with us, as with other nations long agoe, for Virgil Georg. 2. faith. Ityrees Taxi terquentur in

CHAP. XVIII.

Nux Inglans. The Wallnut.

Nto the Wallnut that we have usually growing in our Land, I must adde some others sought out, both nester home and farre abroad, as our of Virginia, two forts, one white and another blacke, 1. Nax Inglans vulgaris. Our ordinary Wallaut.

This Wallnut groweth to be a very high, and great tree, spreading large armes and boughes, so that hymake a goodly shadow, but by reason of the strong seat that the leaves send forth, sew are delighted to rest anunder, the batke of the body and greater armes is of a darke greenish ash-colour, cleft or chapped garas places, that on the younger branches being more greene: the leaves are large and great, confifting of hear feaven leaves, fet one against another, with an odde one at the end somewhat reddish, and very sender mile they are young, and of a weake, sweete sent, but when they grow old and more hard are of a stronger sell, and somewhat offensive: at the joynts with the leaves come forth small and long yellowish catking, which

ominto finall flowers, and falling away the and Nuts come in their places, two or three sally fer together, which are covered with Nux luglans velgarh cam frudte Virginians. double huske, the outermost, thicke, foft, and men, the inner shell hard, wherein is a white dowish bitter peeling, which easily partech mit while it is fresh, but will not peele wing old: the wood or timber hereof is

the weather. Beanse I said in my former Booke that the my differences of Wallnuts did arise in my

writty, which if any be it shall be shew-

The ordinary Wallnut, and a fruite of Virginia,

1414

much greater then the ordinary fort and the shell much tenderer and brittle which being planted grew, and bore Icaves like unto it.but much tenderer and dented about the edges.

5. Nux Inglans bifera, The double bearing Wallnur.

The twife bearing in a yeare of this Wallnut maketh the onely difference from the common fort, for thereof there is no further mention made.

6. Mux Inglans fructu serotino. St. Iohns Wallnut, or the late ripe Wallnur.

This Wallnut shooteth not forth any leaves untill it be Midsommer, or Saint Johns day, as it is said, so that the tree feemeth as dead, others having had greene leaves thereon long before; the leaves and frake differe not from others, but that the nuts ripen not untill October, and then are fresh when others are past and dry, the shell of this is harder and the kernell (ticking closer thereto, that it is more hardly taken out, they take not to fweet as the ordinary fort, but more Wallowish.

7. Nux Inglans alba Virginensis. The white Wallnut of Virginia.

The tree hereof groweth more upright, and spreadeth lesse, the leaves are alike, and the nut is rounder, smaller, much thicker and whiter in the outer hard shell then any of the former fort, and the kernell within much leffe also, but white and as sweete.

8. Nux Juglans nigra Virginensis. The blacke Wallnut of Virginia.

The blacke Wallout differeth little in the tree from the white, but the nut is blacke and round, very rugged or chapped on the outfide, and so hard and thicke a shell that it can very hardly be broken with great strokes of an hammer, having a very finall kernell within it.

The Place and Time.

It is thought that the Wallnut first came out of Persia, for it is not knowne to grow naturally any where, but fill have beene planted of the Nuts put into the ground (for I have not heard that they can be produced by any other meane;) where lower they grow, excepting onely the Virginia kindes : they bloffome earely, before the leaves come forth, ind the fruite is ripe in September, except the late ripe, which as is laid is in Ottober. The Names.

By the name of rapia did the ancient Greekes understand all sorts of fruites, whose outer shell or covering was hard, as Nux Amygdala, Nux Euboica. Castanea, Nux Heracleotica, Avellana, Nux Indica, Nux moschata. Nux Pinea, &c. and because these were brought unto them by Kings, they therefore called them regia flationes: Mux Regia, but afterward it was called Die Banive Jovis glans, and fothe Latines from them Dinglans, but contracting the word, and fubstracting the first Letter, they called it Inglans, other names are found in Pling, whereby the varieties of them were called, as Persica, Tarentina, and Mollusca for those with thinne shels, and Moracina, and Moracilla in Macrobius, for those that come late, their severall titles declare these here. and their general! name by all Authours of late is Nux Inglant, or Nux Regia, the outer greene shell or rinde, is called in Latine Gulioca, and by Festus Culeolus: the inner skinne that covereth the kernell is called Nauci. The Arubians call it Ieuz, Leuz, and Giausi, which is properly but Nux, as Giausi bandi, Nux Bandensis. the Italians Noci, the French Noix, and Noyer, the Spaniards Nuezos, the Germanes Welfchnusbaum, and Nusibaum, the Dusch Note, and Okernoteboom, and We in English Wallnut.

The Vertues. Dodonaus is of opinion that the fresh nuts are cold and moist, but Fuchsius (aith they are drying in the first degree, and warming in the second: the barke of the tree doth binde and dry very much, and the seaves are necre of the same temperature, but the nuts when they are older are heating and drying in the second degree, and of thin parts, and are harder of digestion then when they are fresh, which by reason of their sweetenesse are more pleafing, and better digefting in the stomacke, and taken with sweete wine, they moove the belly downewards, for being old they grieve the stomacke, and cause in hot bodies choller to abound, and the headache, and are an enemy unto those that have a cough: but they are lesse hurtfull to those that have colder stomackes, and are said to kill the broad wormes in the Itomacke or belly: if they be taken with Onions, falt and honey, they helpe the biting of a mad dogge, as also the biting of any man, or any other venome or infectious poylon, Cneus Pompeus found in the treasury of Michridates King of Pontus, when he was overthrowne a scroule of his owne handwriting, of a medicine against any poylon or infection (yet Galen attributeth it to Apollonius Murus, and Etim taketh it out of Struthe his writings) which is this, two dry Wallnuts, and as many good Figges, and twenty leaves of Rue or Herbegrace, bruised and beaten together with two or three cornes of falt, which taken every morning falling preserveth from danger of poyson or infection that day it is taken: the juyce of the outer greene huskes boyled up with hony, is an excellent gargle for fore mouthes, the heate and inflammations in the throate or stomacke : the kernels when they grow old are more oyly, and therefore are not fofit to be eaten, but then are used to heale the wounds of the sinewes, gangrens, and carbuncles: the said kernels being burned are then very altringent, and will ftay laskes, and the feminine courfes taken in red Wine, and ftay the falling of the haire, and make it faire, being annointed with oyle and wine, the like will also the greene huskes doe, used in the same manner: the kernels beaten with Rue and Wine, being applied helpeth the Quinfie, and bruifed with fome honey, and applyed to the eares, eafeth the paines and inflammations of them: if they be eaten after Onyons, they take away the strong smell and sharpenessed them, a peece of the greene huske put unto an hollow tooth, easeth the paines and confument the marrow (the worme as they call it) within it: the catkins hereof taken before they fall thereof dryed and given a dramme weight in pouther with white wine, doth wonderfully helpe those women that are troubled with the rifing of the mother, some doeuse the greene huskes, dryed and made into pouther instead of Pepper to feason their meates, but if some dryed Sage in pouther be put unto it, it will give it the better relish : in the fame manner doe fome use the young red leaves before they grow greater, and find it a feasioning not to be dispi-fed of poore folkes: the oyle that is pressed out of the kernella besides that it is faire better for the painters use to illustrate a white colour then Linseede oyle which deadethrit, and is of singular good use to be laid on guilded workes, or on those workes of wood that are made by burning, such as are those walking staves that have workes on them or the like, to preferve the colour of the gold, or of the other worke for a long time without decay,) is very profitably taken inwardly like oyle of Almonds, to helpe the chollicke and to expell windevety effectually, taking an ounce or two at a time. The young greene matebefore they be halfe ripe; pre Green

The fasture, are not onely a dainty make a true coller of the like nature; but are of good his for those that his make homackes and definition the state of the greene haske before they are halfer the infercellent use both to the fast definition of the plague; if fends the following the fast definition of the plague; if fends thereof all a state of the property of the plague; if fends thereof all a state of the property of the plague; if the plague, and the property of the fame. It is not collect the heate agree wounds and elements, and office the being bathed therewith, the deltilled water likewite of the green baskes being riph when they are halfed from the nuts, is of why good use; to be drunke with a little vines for those that are interested within a plague, so as before the taking thereof a veine be opened, this is of of the night see: the faid water is very good against the Quinsie to be gargled and bathed therewith, and wonders by helpeth deafened by the spile and other paines in the cares, the distilled water of the young greene leaves in tended May, performance fingular ture on foule running ulcers and fores, to be bathed with wet slothes of the sees applied to them even me and morning: there restet to on the leaves of this tree a kinde at red thicke down ingerapplyed to them evening and morning : there refteth on the leaves of this tree a kinde of red thicke dew inthe hortest time of Summer, more then on any other tree round about it, which will be tather dry then bedewed all, which honey dew being taken doth slake the thirst wonderfully: it is a verted by some that if the ripe mits; inter and all be put into hony, they will then be of 10 good efficacy for lores and lore mouther, that thereof may the made gargles and lotions, either inward or outward.

Nux Avellana. The Haffell nur.

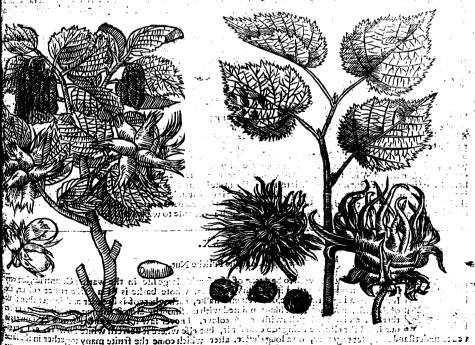

F thefe small nuts there is both tame and wille, those that are manufed and planted in Orchards, are called Fillberds and the other growing wild, Wood nuts or Hartil nuts usually, anto which I must adjoyne some other fores, brought from other farte countries.

T. Nux Avellana saiva fra uno roundo albo. The round white Fillberd.

in hounted Hafell or Fillberd tree (of this kinde, as of the other tame forts) groweth up into a taller and bigbody they the wild Hafell, or wood nut tree doth, but neverso any great bulke or fife, and with fewer fackers have been the growth a brownish speckled thin barke, and dermoft, Fing large wrinckled or crumpled leaves, somewhat like unto the Alder leaves, cut in on the the indignost specific in the winter of change of the specific of a fad greene colour above, and grayish underneath a specific of a reddish yellow. bounded afterwards opening themselves, become more yellow, falling away when the leaves begin to appeare,

T. S. Mil dvilluna fativa er fylvestris. The Fillberd, and the wild Hasell Nur.

A. Nux Avellina Matedonica five By fautina. Filberes of Macedonia or Constancinople,

TRIBE 16

the saus breake forth at other places of the stalkes, three or foure or more together, each enclosed in a tough browne huske, which reacheth beyond the saut, and is parted at the end into fundry jagges, the nut with it is large and round, more then the long fort, with a white thinne shell on the outside, and a white preling covering the kernell within which is very sweete, the wood hereof is smooth, white, and specwhar tough or hard;

2. Nux Avellana sation alba maximo fruits. The great white Fillberd.

Theatrum Botanicum.

This differeth in no other thing from the former, but in growing higher and bigger, and the nun larger by the halfe, but round and white like it.

3. Nux Avellana fativa fruttu longo. The long Fillberd.

This Filberd differeth not in the bush or tree, in the leaves or catkins, in the Nut or the bearded hiskes from the former, the onely difference confileth in the nut it felfe, which is long and round, and bath a browner fhell which is diffinguished into two forts, the one hath the inner thinne skinne or peeling that covereth the kernell. red, and the other white, and each of them of a fweeter talle then the former, and the red of this fort, better allo then the white.

4. W ux Avellana Macedonica five Byzantina. Filberds of Macedonia or Constantinople.

Although Cordus, and Gefner gave the fift knowledge of this Nut to the Christian world, and that but by a short relation, yet since them Clusius hath enlarged the description thereof by the often observations thereof, it groweth up ftraight and tall like a tree, as Cordus faith it was observed in Macedonia and Thracia, (but as Clusius faith, it was reported to him that it grew very low) covered with a whiter and more rugged barke, having fuch like large crumpled leaves, but somewhat longer, the catkins are like the other, but the nuts grow many together in a cluster, whose hard skin or tough huske is much more jagged at the head then the other, and somewhat like wife at the bottome, the Nut it felfe is round like our wood nut with a hard shell, the kernell within being very sweete and pleasant like the Filberd; since which time Classes hath observed it to grow somewhat otherwise.

The Wood Nut groweth with more fremmes or suckers from the roote then the manured kinde, yet some of a reasonable bignesse, branching so th diversly, covered with a like discoloured barke to the former, the graves are leffer and rounder, yet not leffe crumpled greene above and gray underneath, the catkins and nuts come forth in the same manner, but the Nuts are smaller and rounder whose buske is shorter and whiter, and never wholly covereth the nut, but flandeth therein like unto an Acorne in the cup, and herein confifteth the chiefest difference for the manner of growing.

6. Corylus Virginenfis. Virginian Hafell Nuts.

The manner of the growing of those Nuts, we have not had sufficient instructions of all, though wee have feene and had the Nuts of a long time which are as small or rather smaller, and browner then our Wood nute, sharper pointed and with a rougher shell not so hard or easie to breake: the kernell is somewhat sweete and white but not to pleafant as ours.

The Place and Time.

Filberds are planted in Orchards, and the wilde nuts, grow in woods and thickers, that are moift rather then dry delighting best to grow in such a soile, the catkins as is said appeare before the Spring, and the fruite is ripe in August or September at the furthest.

The Names. It is called in Greeke regularormen Nux Pontica, and New rougel's Nux tonnin feve parva, in Latine Corylin of Nux Abellina, from the Country which afterwards altered and fell to Avellana, as also Nun Preneftina, and Heraclestica, the severall titles that they beare, decipher them out sufficiently, as wee and others, have and can call them by. It e Arabians call it Agilenz and Bunduch, the Italians Nocivole, Worthe, and Austlana, the Spaniards Avellane, the French Noisetter, Noiselles and Avellaines, the Germanes Hafelunt, the Durch Haselmer, and we in

English Filberd, for the manured kinde, and Hafell nut; Wood nut, or small put, for the wilde kinde,

These small Nuts while they are fresh are tweeter, and much pleasing to the palare state the much eating of them breed headache and winds essentially when they grow older, but if they be a little heated or parched by the fire, the optimess doth become less offensive, the purched Nuts made into an electuary, or the milke drawne from the kernels with some mode or honyed water, is very good to helpe an old county and being parched and a little pepper pike to them and drunke, it doth digest the destriction of the time, from the head, some doe hold that these Nuts, and not Wallnuts, with figs and Rue, was the state of the stat The Vertues.

Naz Diffusion The Pillicke Nut

He Filticke Nor groweriff to be a tree of steafonable large file in the warme Countries, but very flenderly in ours dispersed into sindry Dankbes, whole barke is of a darke ruster colour, the leaves are winged three me, of the hole of the Ash, not the probable blunt pointed with us, smooth, almost shaining, with divers verses therein, and of a pale yellowish greene colour. I never saw it beautiful fruit or slowers in our Land, the climate being too cold for it, but else where it beautiful the sowers as I am given many for together, on a long cluster of the white it beautiful white sowers as I am given many for together, on a long cluster of the strain to the strain to the same room to the same

ven to understand many fet together, on a long cluster, after which come the fruite many together in the same

which are somewhat long and round nuts, bigger then Filberds, pointed at the ends, with a rough outer hell formewhat like an Almonds outer shell but tough, and hard to breake, yet cleaving into two parts, and smooth and white on the infide thereof, having a full greene Nuis Pillaria. The Fifticke Nurs.

ant or kernell within, filling the whole shell, whose sinde or peeling is thicker and red, the kernell is very fweete and pleasant in talte, without any offensive mality therein : this in the warmer countries beareth log long crooked stalke like as the true Turpentine The Place and Time

Frie naturall to Ballria, and other those parts neere to the East Indies, and from thence brought to Sprin and Eript, and from them unto our Europe, where at Naand other warme Countries of Italy, they the ive and profper, and beare fruite in the end of the yeare, but not in any of these colder climates.

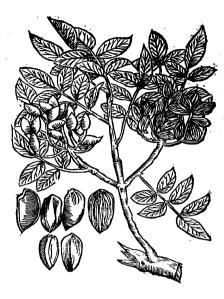

The Names .

Itiscalled in Greeke msawa Piffacia, of Nicander enius Phiftacia, and in Theriacis firmino Pfictacion by Possidonius Bisana Bistacia, in Latine Pistacia and Fiftuium, and of tome Nux Piftacia, Theophraftus alleth it Terebintbus Indica, for his description thereof agreeth fo exactly hereunto, that there can bee no doubt made of it. The Arabians call it Fuffecke or Fefich, the Italians Piftacchi, the Spaniards Alboca-gu, and Pifticos, the French Pistaches, the Germanes Pinner nu/kilin, and by that name they likewife call the bladder nut, not putting any différence betweene them as the most judicious in former times did, the Dutch Fiftiken boom, and We in English Piftackes, and Dutch Fifting. Fiftieke nuts or tree.

The Vertues.

The Piltacke kernells be little inferior in goodnesse unto the Pine kernels for they are very friendly to the flomacke, whether they be eaten or drunke, they are good against the stingings or bitings of serpents and other venemous creatures, by reason of the thin essence, and a little bitter and sweet substance is in them: and

therefore they open the obstructions of the Liver, and are good also for the cheft and lungs, there is also a little aftringent quality in them, whereby they ftrengthen both the liver and the stomacke, to be put either in meates or medicines i they are also good to clense the backe and the reines of the gravell and stone breeding therein s. they nourish more then any other nuts and helpe to encrease seede and Venery.

CHAP. XXI.

Nux Veficaria. The bladder Nut.

S a baftard t rother to the Piftacke, I must adjoyne this bladders nor, whose groweth is not much unlike rifing up sometimes into a reasonable tree, and in other places shooting forth fundry suckers, whereby it becommetarather an hedge bush to be plashed, and let spread, the barke whereof is of a whitish greene colour, the leaves are five for the most partiest together on a statke; each a little defined about the edges, and pointed at the ends; of a pale greene colour the stowers grow on a long stalke many sections, hanging downewards being all white, the small round cuppe in the middle, making them femelike unto a white Daffodill : after them come swolne russetish greene skinny bladders, with one or two brownish nuts, lesser then Hasell nuts, with a tough hard shell not easie to breake, and a greenish kernell within is, at the fifth fomewhat sweete, but afterwards loath some and ready to make one cast, yet it is eaten by some Country people, whose ftrong stomackes are not so easily provoked : the wood is white, hard and firme. Mr. Trabeant hach brought a fort from Virginia; having divers nuts in the bladder.

. The Place and Time. It groweth in many places of this land, both as a hedge bush, and a standard tree at Ashford in Kent, and at Mil-

to, three miles from Cambridge, and flowreth in May, the fruite is ripe in Anguft or September, The Names.

There is no mention hereof among the ancient Authours, either Greeke or Latine, except it be taken for Pli-"his Staphyladendring, withereof some doe in some part doubt, because he faith the nurs grow in filiquis, but these Merkinny bladders, yet the rest agreeing to his description thereof, causeth others to thinke his flique must be inderstood theichladders: the Garmanes as I faid call it by the fame name they call the Pistacke, and ther fore others call it Pifacium Germanicum. Matthiolus in his Epistles taketh it to be the Contont, and Hebulbem of the Turkes, but that is faid to be a nut, of the bignesse of both ones fills, and such this is not, and is of great respect for the pleasure refleamong them. It is usually from the forme it carryeth now adayes, called Now veficaria, and in the places Piffuria fylvefiris, and to Scaligentakethy it to be a fecias of it, Gefner faith, that some Italians at

Virginenfis

Rome called it Sambucus valida, and Anguilara faith the Italians in other places call it Albero de l'una, and l'illachio salvatico, the French' Nez compes, the Germanes Pimpernuszlin, as they doe the former, the Dutch Pimpernoeten, and we Bladder nut.

The Vertues.

The Nuts are as is before faid, loathsome and overturning their stomackes that eate them, although Scaliger commendeth them to be of the like taste and quality with Pistackes, but wee will give him leave to please his palate, and stomacke with them, and will not envy the good he shall get by them, we never yet could learne that they were accepted among our people, except with some strong clownish stomacke, which can almost digest an horse naile. They have no use in Physicke, with any judicious that I know, but some Emperickes, that dare venture to give any medicine, be it never so daungerous have boasted of the helpe they have given to those that were troubled with the stone, and others to procure Venery.

CHAP. X XII:

Fraxinus, The Ash tree.

He Ash according to Theophrassus and other of the later Writers, is distinguished into a taller and a lower fort, or as with us into the tame and the wilde fort, which shall be here declared.

The common ereat Ash.

1. Fraximu vulgaru. The common great Aft.

The common Ash groweth high quickely, and in time becommeth to have a reasonable big trunke or body, covered with a smooth grayish barke, under which there is a thinner which being steeped in water a while, will give a blewish colour, spreading reasonable well, and bearing winged leaves of many, set on both sides of a middle stalke, and one at the end, each being long and somewhat narrow, gentle, of a pale green colour, and dented about the edges; at sundry joynts with the leaves commeth forth a bunche of slowers, and after them a thicke tust of many thinne browne huskes hanging downewards, each upon a very small short soorestalke, within which lyeth a small blackish browne long stat seed very like unto a birds tongue, tasting somewhat strong and hot in the mouth: It beareth also somewhat seed very like unto a birds tongue, tasting somewhat strong and tough fit for many uses, sor by the toughnesses, and in some places certaine small round balles called apples, consisting of a clammy mosses, sor being apt to cleave or rend, it is much employed about coaches Carts, &cc. and for handles for tooles, and instruments of busbandry. Homer chaunts the praises thereof in Achilles speare, made of Ash, which holdeth good in all the speares, pikes, &c. used in warre ever since.

fpeare, made of Ash, which holdeth good in all the speares, pikes, &c., used in warre ever since.

2. Ornus sive Fraxinus structure. The wild Ash or Quicken tree.

The Quicken tree groweth st idome to any great height, with sundry spread branches, covered with a more rugged and darker barket then the Ash, the leaves are winged like unto them, but are lesser and so severy particular one by it selfe, not so closely set together, dented about the edges, and of a deepe greene shining colour: at the end of the branches come forth white slowers in a reasonable great tust or umbell, sincling pretty and sweete, after which follow small round berries, greene at the sinfly and darke red, when they are through ripe, of an unpleasant taste, ready to provoke casting, if one eate many of them, the wood is somewhat hard and firme, but of a browner colour then Ash.

The Place and Time.

The Ash delighteth best to grow in the wetter rather then in the dryer grounds and by Medow sides: the other groweth in sundry places of the Land, in woods chiefly, and those by Heigh gate in sundry parts, the bales or apples of the Ash come forth in the end of Winter, and then they are to be seene, but the seede and fruite of them both is not ripe untill September.

The Alh is called in Greeke paris, and in Latine Francisco : the stode is called linguages, but the inter kernell is so called rather then the whole huskes the other is likely to be the lyamala, Francisco mentancos Theophrashus,

I. Fraxiam vulgaris.
The common great Aft.

2. Omm fre Franken Steffrie. The Quicken tree or wild Alle.

which Pliny calleth in Latine Drows, of some Orneoglossum, and Columella Fraxinus sylvestris. Tragis calleth it husiaes arbor, Dodoness Fraxinus bubula, and Gesser Fraxinus aucuparia. Rection, Gesser, Dodoness, and orders call it Sorbus sylvessus, Elessing, Culsius, and Thalius, Sorbus aucuparia, because that boyes, and sowlers use the berries as baites to catch Blacke birds, Thrushes, &c., and Lusanensis Sorbus terminalis, without any sense or reason, but they that referre it to Sorbus the Service tree, ut in my opinion as short in many things, as they that referre it to Fraxinus, the Ash resembling both of them in the lease, which causeth the variation. The Italians call the Ash Fressins, the Spaniards Fressins, the Fr

Both the leaves and the feede of the Ash are fingular good against the biting of the Viper or Adder, or any other remembers executive, for if the young tender toppes with the leaves be taken inwardly, and some of them applyed outwardly, it will resist the boy son that it so half doe no harme, Serent and the face in the faced. Franciscum serious Bacchi vore bigendamy of it. the wood and the barke is by substantial to the faced. Franciscum serious Bacchi vore bigendamy of it. they wood and the barke is by substantial to the face of it is and to this purpose Pliny written that those serious and the evening which then are longest, nor will come needs the interest action this owner experience, that it aftened a serpent be encompassed within a circle of the bounds of the latter. It will soone the into the fire then into themsete decoration of the leaves in wine, are very great the object to be the serves of the Ash, is a singular good medical the latter. It will soone they into the fire and such that are subject to a dropsie, or be already grosse and face the new of the latter of the Ash, is a singular good medical the latter of the subject to a subject to the subject to the ash were dealy to beasts that carryed burthess, and harmelesse to the rest that there is a subject of the Ash were dealy to beasts that carryed burthess, and he referreth it to usas Frazini. The subject of the barke of the Ash made into a lye, and those heads or other places infected with lepty, or other white source of the barke of the Ash made into a lye, and those heads or other places infected with lepty, or other white source of the barke of the Ash made into a lye, and those heads or other places infected with lepty. CHAP. XXIII.

Sorbus The Service tree.

Ecause the true Service tree is so like unto the tame and the wild Ash in the leaves, and that the wild Afh is called a Service by divers, I thinke it meete to joyne it next unto them, and with it fome other forts that have obtained the name of Services, although differing much in forme from it. 1. Sorbus legitima. The true Service tree.

The true Service tree groweth in time to be a great and a tall tree, fpreading fundry great branches, covered with a rough grayish barke, whereon grow large winged leaves, greater and longer then those of Afh, and each of them broader, more blewish greene, and harder, and more grayish greene underneath, and more dented also about the edges: the flowers grow in clusters, at several places on the branches with the leaves confifting of foure white leaves a peece, after which follow the fruite as big as Wallauts shaled out of the greene huskes. tending to yellow when they are ripe with broad browne kernels within them, in some round, which are accounted the belt, in some ovall that is long and round, and in some almost Peare fashion, which like other Services are hard and harsh when they are ripe, and must be hung up on strings in a warme roome, or laid covered with firaw.chaffe or forme cloathes to make them mellow fit to be eaten, which then will be more pleafant than mellow Mediars, the wood is very firme and close, and yellower then the Ash.

2. Srobin Torminglis five valgaris. Our common Service tree. Our common Service tree rifeth up to a reatonable height and bignette, spreading largely with a whitish colored (mooth baske, the leaves grow fingly by themselves, which are not winged but broad and cut into fundry devisions and broad at the bottome nextito the stalke, of a sad greene colour, the flowers grow in clusters of a whitish colour at the end of the branches for the most part, which are succeeded with smaller round berries then the former, and browner also, containing within them small blackish hard kernels: these must likewise be mellowed to be caten, or elfe let hung on the branches untill the frosts mellow them on the trees, unlesse the birds devoure them being neglected: the wood hereof is of a brownich yellow colour and hard.

3. Sorbus Stveftris Anglicus. Red Chesse apples, or the English wild Service. This tree which we entitle a Service, from the harshnesse of the greene fruite, groweth not high usually, but ra-

> 1. Sorbus legitima. The true Service tree.

2. Sorba Terminala vulgaria. Our common Service tree.

Markana, v. 19.20120

his as a hedge bush, whose stemme and branhes are covered with an hoary or grayish barke, the leaves are broad, fomewhat like unto Viburnum the lithye tree, (which Gerard calleth the Wayfaring nee) not cut in nor dented at all about the edges, the howers are of an over worne mossie colour, after which followeth fruite, of the bignesse of an hedge peare, and reddish on the outside, of an harsh talle like the unripe or hard Services, yet the Country peoneedoe often eate of them, being ripe from the tree, infead of better fruite, but after they have beene gahered and laid by a while to mellow, become more picafant.

4. Sorbue filveftrie Aria Theophrafti ditta. The wild Service called Aria.

This wild Service tree groweth to be a very great will and farre spreading tree, with many boughes and branches, whereon are let large crumpled hard leaves dideepe greene colour on the upper fide, and gray ghairy underneath, with divers veines running almost upright therein, and dented about the edges, the howers are of a white mossie colour, thicke clustring meether, made of foure leaves a peece, which tuine imbrownish red berries, with a small tust at the top, containing within them fmall blackish seedes, and are of a harsh taste like to the rest, yet very pleasant, more then any of the rest, after they are mellowed: the wood is very hard, and firme or close, and whitish withall.

The Place and Time. The first is seene with us but in a few places, and those onely planted for their rarity. The second is

found in many places of England. The third in Weltunland, on a hill that respecteth the Sea eight miles from Lancaster called Roother stacke, but more plenti-

thully in Wether flacke Parke, as I am enformed: The last groweth likewise in some places here and there; throughout England, as in the parts not farre from Groydon, and one tree also growethon Hampestead Heath alone by it felfe, without any other nereit on the left hand of the high way, as you goe on forward to Hendon, they do all sower before the end of May, and the fruite is ripe in O Stober.

Itis called in Greeke of and out, Oa and Oaa, in Latine Sorbin i the first is the Sorbin legitima of Clusius, Sori bu esculenta of Camerarius, Sorbis domestica of Matthiolus and Lobel , who also the right it might be Oftrya Theoprofit but erroniously, as by the discription thereof given before may be seene, all other authors call it Sorbus simply the second is the fourth Sorbus of Pliny which hee calleth Torminalis as Cordus, Tragus, and Matthiolus doe ! whough Lugdunenfis misliketh of it laying that the leaves are nothing like the Platamas, whereunto Pliny con ... pred them , he therefore calleth that Sorbus terminalis , which is called Ornus or Frakinus silvefiris, as I have hewed you before, because he would call it Cratagus Theophrasti, as Anguilara did before hims which it is to no:withlanding, nothing hindring but that it may as well be Crategus Theophrafts, as Sorbi quartum genus Pling 48mm Torminalis, both the discriptions agreeing fitly hereunto, Clufte and Lobel, and divers others, and Gefner ibirin allo call it Sorbin terminalis, who yet thinketh it might be a species of Mespitus Aronia, and peradventure mybe Theophraftus his Ambenodonoides, which Gaza calleth Gallica. Baubimus placeth it as one of the Medlars, the doth also our Hawthorne, which in his eighth number he referreth to the Oxyacantha Pyrastra similio of Dissertes, and yet in his ninth number maketh that Oxyacantha Dissertide to be Pyracantha of Lobel and Clui, which hath no such divided leafe as the Hawthorne hath, and yet both of them beare berries like Services, and not Apples like Mediars, fome also tooke it to be the Hippomelis of Palladius. The third hath not beene dirulged in writing by any before me, and therefore that Latine name may fland untill a fitter may be found, the Natives there call them red Cheffe apples, and Sea Oulers. The last is taken by all our Moderne Hetbarists to be the Aria of Theophraftus, although Bellonius faith as is frewed before, that that kind of Ilex or Oke that is called Aglaca in Candy, doth hold the name of Aria in Mount Athos, as is shewed before, Lobel calleth it Aria Theobraili efficie Alni. Clusius Sorbus Aria cognominata, Gesner in hortis Aria Alpinavel pilosa, Bellonius callethic Suburterminalis Gallorum, and Anguilara and Lugdunensis Aria also, and Theophrafti, as Camerarius doth; who faith Cordus called it Lanata arbor. The Service is called by the Italians Sorbe, by the Spaniards Servas, by the French Cormes, and Sorbes, and the tree Cormier, and Sorbier, by the Germanes Sp rwerbaum the tree, and Sperbierathe fruite, the Dutch Sorben, and Sorbenboom, and we in English the Service tree or fruite: the last is called by the Italians Matallo, and by the French Alifier, and Cirier by some.

Services unmellowed are very harsh, able to draw ones mouth awry almost to be eaten, or else to choke one. but made mellow they are more pleasant, and fit to be taken of most to stay flixes, scowrings, and castings, yet elle then Medlars, although many doe cate them that neede not for any fuch purpose : if they be dryed before deybe mellow and kept all the yeare, they may be used in decections for the said purpose, either to drinke or

4. Sorbus (glueftiù Aria Theophrafti dilla. The wild Service tree called Aria.

to bathe the parts requiring it, and is profit fied in the manner to fray the bleeding of wounds to bathe the parts requiring it and is prome to mouth or nois to be applied to the forcing the dispersion method in the second of the second o

film. The Mediar.

Here are observed fundry force of the lars whereof three were knowne to the anneient William the res are of later invention.

are of later invention.

1. Melpith ma ima lativa. The great manured Medlar.

The great Medlar groweth pare to the bignesse of the Quince, but never so greats an Apple tree that ever I saw, spreading branches, recombile largely, with longer and narrower leaves then either Apple or Quince, and not dented at all about the course at the end of the springers stand the slowers made of streighting great broad pointed leaves, nicked in the midds with some white threds also: after which commetts the finite, being round and halfessay, as a haske with rein the flower stood before, which greene leaves, as a haske withrein the flower stood before, which crowne of leaves being mided off or falme away, the head of the fruite if seene to be somewhat hollow, the fruite is very harsh before in be mellowed as is said of the Services before, and hath usually sive hard kernells within it.

2. Messilva with green in the street of the mide.

The ordinary or small Medlar.

2. Meshilus vulgaris five miner. The ordinary or small Medlar.

The ordinary Mediar differeth in nothing from the former, but that it hath fome thornes on it, in feverall places, which the other hath not, and that the fruite is small and not altogether so pleasant.

3. Mespilus minor folio serrato. The common Italian Medlar.

This also differeth in nothing from the last that hath thornes, but that the leaves are dented about the edges when as the other is not.

Mespilus fruttu albo magno. The great white Medlar.

This differeth not from the first fort but in the fruite, which will be as great as it, and more white then it being ripe on the tree, and will not be so browne when it is mellowed, the kernels also within them are not to them.

. Mespilus Aronia sive Neapolicana. The Mediar of Naples.

The Mediar of Naples rifeth to be a reasonable great and faire spread tree, bearing broad leaves, cut in or divided on the fides into i verall parts, but not to the middle ribbe fomewhat refembling the Hawthorne leaves, with thornes fet fometimes on the branches and fometimes without, the flowers grow in tuits like unto the Service

> I. Melpilm maxima fativa. The great manured Mediar.

Fig. 1. and the first of all the control of the con

e of a greenish colour, which turne into fruite, many cluto the final training tra and with a lefter crowne of leaves, and hollownelle was roppe then it, reddish or yellowish when they are ripe twing only three hones or kernells within it, and more fweet

The Place and Time.

Three of these forts grow with us here in our Land, the two first in many places, and the last with some few lovers furties, the other two have not as yet beene feene here: they flower in . May for the most part, and beare ripe fruite in semmber and Offiber.

It is called in Greeke wan'An and with A in Latine Melbilus mod the fruite edico Nor Mefpilans. The first fort may bee the Mehilus Setanica of Theophraftus and Pliny, and taken by mamy to be the Mefpilus altera of Dioscorides, which he faith fome called Epimelis, Trages although he call it Mefpilus yet which it to be Crateges of Theophrafts, which it cannot be, be that Theophrastus laith Cratagus hath the leate of Melpiin Authodon, which harh a divided leafe, for hee describeth mother Melpilm, and is the same with Dioscorides his Mefilm Aronia, as you shall presently heare: it is also that which Idel calleth Domefisca, Cordus (ativa, and Camerarius in lute Setania majoribus vulgari fruttibus, Tragus Mespilus frells prastantiore, and Dodonaus Mespilus Oxyacantho inseta; or as Lugdunenfis faith, infitione mittor fatta. The fecond is smed five firit by Banbinm, as well as Laurino folio, and Grmanica being the more ordinary both with them and us. Thethird is fet out by Matthiolus and Lugdunenfis, but their fewes do not expresse the leaves to be dented as they should e. The fourth is spoken of by Scaliger and Lugdumenfis. The all is the Mespilan, called Aronia of Dioscorides, the Mespilm Anthedon of Theophraftus and Pliny, and is the first Mespiwot Matthiolms, and generally called Mespilus Aronia with all other Writers, onely Ruellius, and Gefner in hortis alleth it Palinem Africana, and Cordes Mefpilm tricoccos. and may peradventure be the Mespilm Gallica of Camerarius The Median of Naples.

inborso. The Arabians call it Zarar or Zarur, and Alvarur, the Italians Mospoli (but they call the last which we all of Naples Acareto, derived as it is likely from the Arabians Zarnr) the French Deflier, Mefplier, and Mefor, and the fruite Nesse and Mesple, the Germans Nespelbaum, and the fruite Nespel, the Spaniards Nesperas, the Dutch Mefpelboom, and we in English, the Medlar tree and fruite.

The Vertnes. Mediars have the like properties that Services have, but are more effectuall in operation to binde and flay any res of blood or humbers in man or woman, the leaves also have the tame quality, but besides these effects the isolowed fruite is often Greed among other forts of fruite to the table, and e ten with pleafure by those that have mede of physicke, but worketh in women with childe, both to please the taste as in others, and to stay their longings after unbifual meaces, ec. as alfo very effectuall for them that are apt to miscarry, and before their time whedelivered to helpe that malady, and make them joyfull mothers: that of Naples is the more delicate & is alfo seconted the more effectual for the laid purpoles: the decoction of them is good to gargle and wash the mouth and throate, and reet h, which there is any defluxion of blood to ftay it, and of humours, which can let h paines and fieldings, to bindesthole defiliations and cafe the paines: the fame also is a good bath for women to fit in or over, that have their course some downs too abundantly, or for the piles when they bledde too much: the same Wiferveth well both to definite and so bathe the Romacke warme, that is given to call itte of lotth or not to hold and containe their mence and digelt it, but if a pultie or plaifter be made with dryed Mediars, pearen and mixed with the invoc of Red Roles. whereunto few Cloves and Nutmegs may be added, and a light red Corall alfo. and applyed to the Brimanke it will worke the more effectually : the dryed leaves in potter farawed on bleeding o fresh wounds; rettraineth the blood, and healeth up the wound quickely ! both leaves and fruite are offineular good use to binde, and to krengthen whatsever hath need of those qualities. The Medlar stones made into putter and drunke in wind whetein some Parilye rootes have lyen infinied all might, or a little boyled, doe breake the stone in the kidnes halping to expell them.

CHAP. XXV.

Chamame pilas & Enimelis. Dwarfe Medlars and other fuch like finall fruites?

Here are some other small fruites to be spoken of that are fittelt to be referred to Medians and Services. though resembled to Quinces and Apples, by their Authours, and because they were not to be pur into the former Chapters. I thought to entreate of them next unto them, in a Chapter peculiar to them.

Fr 1BE 16.

1. Chamemespilm. The dwarfe Medlar.

This dwarfe Medlar which Gesner to called for some likenesse it had in the fruite, with the ordinary Medlar, although but a little, is a small wooddy thrub, covered with a reddish ash coloured banks, having small leaves growing thereon, every one by it felte, somewhat like unto Bassill faith Gesuer, but gray or hoary underseath the blossomes are small and greenish, standing either singly or by couples on slender southest after which follow. fmall reddiff round berries, with a small crowne of leaves at the head like unto the Medlar, without any sape or investherein, or very little, and having two or three small seedes like grape kernells within each; the leaves fall every yeare, and the roote liveth shooting up some twiggy stalkes, 2. Epimelu Galeni. The small bastard Medlar.

This differeth from the former in that it rifeth with longer stemmes or stalkes, whose leaves are greene above and gray underneath, somewhat like unto the former, but fomewhat larger, the flowers hereof come forth upon a pretty long footestalke one above another, very like unto the blosfomes of Arbutas the Strawberry tree, that is, like a little round bottle with imall brimmes, and not as the Medlar, laid open into five leaves, which flowers are of a pale blush colour, and turne into small berries, of a yellowish red colour, with a little head or crowne like the other, but leffer, not to bigge as Hawthorne berries, but as dry and fapleffe, with three or foure hard white feedes within them, of a little dry but no great harsh taste: the leaves hereof likewise fall away in Au-

tumne, and rise againe in the Spring.

3. Cotonafter Gesneri. Gefner his baltard low Quince.

This little fhrub, (Gefner sheweth todiffer from his dwarfe Medlar, least any should suppose them to be both one,) hath larger and longer leaves, a little dented about the edges, yet hoary white, as the Quince tree leaves are, and hath berries not fo round nor fo red as it, but tending fomewhat to yellow, with foure three fquare feedes in each berry. The Place and Time.

Both the former and the later, grow in fundry places of Germany, and of France alio, and fo doth the other alio, and their berries ripen in Angust.

I. Chamewefp im. The dwarfe Medlar.

Mitard low Quince

ទាញមជិញ សម៌ស្រែសា កាយសាងសារសារ

The Names. A pleafeth Gefaer to name the first Chamene spilam, whom almost all since Bave followed, and called so in like the state of the state o is Setamies, is our common Mediar, whole fruite as well as tree is farre greater then of this. The fecond is the limits of Galen, wheteof he maketh mention lib. 6. fimpl. medic. and differeth from the Mediar in called, thereof he ipeaketh in another place; for he faith that the fruite hercof is fowre, and hurtfill to the from the al that the Country people of Italy did call it Vnedo, (which is probable they did so, because the biossomes are say like those of the Arbusas which is also called Unedo) Lugdunensia calleth it Epimelia attera, but is not Clusthis third Visio Idea, as he thinketh, which hath blacke berries, but this hath red as he describeth it, and theremetherein wa deceived, yet thinketh it to be the Cotonafter of Ge/ner, which Clufin contradicteth. The third indeede the Cotonafter of Gefner, which Clufius also mentioneth in his history of plants, with his Chamemofpihand Pitte Idea. Banbinsus maketh a doubt whether it be not the Agricomelea of Bellenius. Banhinus feemeth to where o feverall plants thereof, as may be seene in his Pinax. These plants have gotten fundry Germane names mong the Alpife inhabitants and others, as by these divers names in Latine derived, for the Germane may be ea-By maderflood, and became we wanted names to call them by, I have given it them as neere as I can, either from in Laure or their proper effects, and thus much may fuffice untill we further be informed of them. The Vertuess

There can be little felid of any of these plants, seeing so little hath beene faid by those moderne Authours, that Mawrote of theme for fome of them being dry berries, are wholly neglected, and the other that have some mercilish or sweete taste, are onely eaten by the Mountainers and their children, and not applyed as mediciwhe for any griefe.

CHAP. XXVI.

Acer. The Maple tree.

Here are onely foure forts of Maple trees knowne to us, that I am to shew you, but Banbiniu doth di-stringuish them into foure thus, Sphendamniu is that Maple that is white and full of veines, Zygia is yellow and crispe, Cimosrochon is yellow and not crispt, Glinon is white with few veines, but wee must give them you by other termes.

I. Acr majus Lasifolium Sycomorus dictum. The great broad leafed Maple or Sicomore tree. The great Maple (which hath beene with many falfely called the Sycomore tree) groweth quickly to be a great

Acer major latifolium Sycomorus falfo dictum. The great broad leafed Maple or Sycomore tree;

TRIBE 16.

and a tall tree, spreading many faire branches, which make a goodly shadow, covered with a reasonable smooth barke, having many very faire large leaves thereon, set upon reddish sootestalkes, cut somewhat deepely into parke, naving many very raile large season the edges, greene above and grayifh underpeath, the flowers are of a whitish yellow greene colour, standing on a long stalke, with some few threds within them, each

flower yeelding two winged huskes, parted at the stalke, which are thinne skinnes at the ends, and bunched our, where the feede lyeth within, and are very like unto the common or wood Maple, but much larger, and many more standing together: the wood is whitih and smooth, but not so white, smooth, and close, as the wood kinde is.

2. Acer minus five vulgare. Our common or wood Maple tree.

The common Maple tree groweth lower & flower then the former, fomtimes in hedges, no higher then those other hedge bushes, or els much highe rcovered with a more rugged barke, spreading neither to far nor such great branches, the leaves are much smaller, thinner and not so deepely cut in, but yet divided into five parts, and somewhat broad, at the letting on of the stalke, of a deepe and shining green colour on the upperfide, and paler underneath: the flowers and feede are very like the former, but fewer fer on the stalkes, and lesser also in bulke or bignesse; the wood hereof is very white, very finooth, and very close grained.

3. Acer montanum.

The mountaine Maple tree.

This Maple differeth little from the last, that groweth well and great, differing chiefely in the leafe which is not flat next unto the stalke, and is somewhat deepelier cut into more distilions.

4. Acer Creticum trifolium. The three leafed Maple of Candy.

This Maple groweth to be a tree of a meane file, spreading branches teasonable well, the barke whereof is of a darke reddish colour, having broad greene leaves full of veines, divided into three parts, standing equally distant one from another, with a long stender footestalke under them, the flowers stand onely a couple tegether on the stalke, as the seede that followeth doth also, winged fornewhat like the last but smaller.

The Place and Time.

The first is no where found wilde or naturall in our Land that I can learne, but onely planted in Orchards or walkes for the shadowes sake, but groweth in sundry places in Germany, &c. The second and third are found both on high and low grounds, in Woods, and Groves. Parkes, Chases, and the like through most Countries of this Kingdome, the one in the moister grounds, where the wood will be looser, and the other in the dryer grounds, firmer and closer; but the latt is also attranger to us growing about Mompelier and Candy, they all flower about the middle of Aprill, and the feed is ripe in the end of september. The Names.

It is called in Grecke see Soft & Sphendamnus, in Latine Acer. The full is that which Clusius calleth latifelium, because it hath the greatest and broadest leaves of any, and therefore Trague calleth it Platanue, thinking as divers did, that it was the true Platanus, and therefore the French did call it Plane, before the true one was discovered and knowne. Ruellim and after him many others called it Sycomorus the Sycomore tree, which in divers Countries doth still continue, and with us also being called usually the Sycomore tree: but by this name of Sycomoris the Sycomore tree, divers Writers have called divers trees, as first the true Sycomore or Mulberry Figge, called of divers Ficus Pharaonis Ficus Agyptia, Morus Agyptia, and Ficus Cypria. Matthiolus and others fay that the Italians call the Acaderach by the name of Sycomorus. And Petrus Crefcentius, calleth the Virga fanguinea, by the name of Sycomorus. And lastly Ruellius and others say that this Acer Latifolium, is called Sycomorus, yet Clusius faith that the French call the leffer or wood fort fo. The second is that which is most frequent in Our Land, and called Acer tennifolia, by Cordus in histor. Acer minor by Dodoneus, Clusius, and Camerarius, Opio by the Romanes, Opulus by Gesner in bortu, and Cordus, and Opulus campestrie by Lugdanensis, who also taketh it to be Carpinus, but not rightly. The third is the Aceria altera species, qua forte Zygia Theophrasti of Lobel, by Bellenius Acer montanum, flavum & crispum, and Asphendamnos by the Country men of Candy, by Lugdunensis Opulus montanus, and can be no other then the Zygia of Theophrastus, which Gaza calleth Carpinus, which different much from the Oftrys, which some as is before said call Carpinus. And the last his Glinen, which hee rendereth Gallieum. The Italians call it Pie doca, and Platano acquatico, the French Erable, the Germanes Massholder the common fort, and Aborne the greatest, the Dutch Luytenhout, and we in English Maple, and some, but as faisly as the French or any other, the Plane tree.

The Vertues. Neither Dioscorides nor Galen, in his centure of simples, make any mention of this tree, yetlib. 8. med. part. cap. 8. in the medicines for the Liver, written by Afclepias, he appointeth a dramme of the roote to be beaten to pouther, and given in water, but Cornarius doubteth that the word is miltaken, because none of the Greeke Writers have made any mention thereof, or that it should be used in any disease. And none but Pliny hath recorded any of these Maples, but faith that the roote of the Maple being bruised, is applyed with very great effect unto those that have obstructions, or any other paines of the Liver, or Spleene, which Serenss delivereth in these Veries following:

4. Acer Creticum trifolium. The three leated Maple tree.

The Theater of Plants.

Si latus immeritum morbo tentatur acuto, Accensum tinges lapidem stridentibus undia. Hine bibis : aut Aceris radicem tundis, & una Cum vino capis , hoc prafens madicamen habetur?

Thy barmele (fo fide if Barpe discase invade. In biffing water quench an heated stone, This drinke : Or Maple roote in pouther made Take oft in Wine, a present med cine knowne.

It is used in many joyners works, especially the finest wrought grained wood, which Pliny peradventure meant 16,6,6.16. by that which he there calleth Bruscin, and Molluscin, the more excellent both of them as he faith, is mir Aceria, the knotty part of the tree, or of the roote thereof, which is held to be fuller of diverlified veines herein: either of which faith Pliny, if they were large enough to make a table, would excell the Cedar, as some nke it, tut others thinke it should be Citrus the Citron.

CHAP. XXVII.

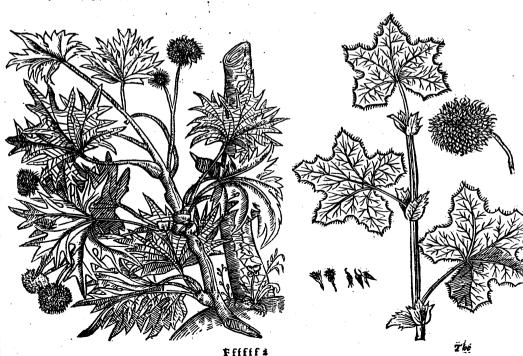

1. Platanus orientalis verus. The true Planetree of the East Countries.

Ecause in the last Chapter it is shewed that the French and others were utterly mistaken in calling the Maple the Plane tree : I thought it meeteft to shew you which is the true kinde next thereunto, and to joyne thereunto another fort, brought by Mr Tradescant, out of Virginia. It rifeth up to be a very great tree in time, spreading very largely, the barke whereof is rugged, the leaves are very large, or into five divisions, and each of them deepely gashed on the edges, greene above and whitish underneath hangingby assender reddish stalke, the flowers are of a pale white colour, many set together on a long stalke. after which follow fundry round rough bals of the bignesse of Wallnuts, made as it were a bur, but not sticking, whereinlye small seede, the wood is firme, hard, and yellowish browne.

2. Platanus Occidentalu ant Virginenfir. The Plane tree of the West parts or Virginia. This Plane tree likewise groweth great, and spreadeth fairely, whose leaves being broad and large, have not bedeepe divisions in them, and the pills or burres are, although somewhat rough with the compleat roundnesse. acto harpe as the former, which being fet hereby is utterly spoyled in the cutting, they grow also many hanginglowne from the ends of the branches, as in the others.

1. Platanm Orientalis verus. The true Plane tree of the East Country.

2. Platanus Occidentalis aut Virginen fis. The Plane tree of the West parts or Virginia.

TRIBE 16

The Place and Time.

The former groweth not naturally in any Country of Europe but in Alia, Spria Egypt, and Africa many, and they The former groweth not naturally in any country or the fladowes fake onely: it is found with very few are planted also by the way sides, and in market places, for the shadowes sake onely: it is found with very few in our Christian world, and those onely great lovers of rarities, being very tender, not enduring without extraordinary care and keeping, the cold of our climates, the other is but lately brough: from Virginia by M. Tradefeast The Names.

It is coiled That we in Greeke, and Platanus in Latine, alate diffusis rames nomen fortitaeft : and by this name all Authours have called it that have written of it. The Arabians call it Duth, the Italians Platano, the French Platane, that it may differre from the Plasne, whereby as is faid they call the Maple, the Germanes know it not, and therefore they and the Dutch have no peculier name, but as they take it from the Franch Plane, even as we doe also, calling it the Plane tree: Dioscorides calleth the fruite or burres of wein, and Pliny Pilule. The Virginian being to like the other can have no other name. The Versues

Galen faith that the lane is of a moist and cold nature, but not farre from a temperate, and therefore the green leaves bruifed and laid on inflammations and hot fwellings doe helpe them, but the barke and the barres are more drving, which being boyled in vinegar, is good to gargle the mouth for the paine of the teeth: the burres also fryed with fat is good against burnings, the burnt barke mixed with water doth clense the skin of any scurse, lepry, or other deformities of the skin, and doth dry up much also, old moist and running ulcers, bringing them to cicatrifing: there is faith Galen and Dioscorides, a kinde of dust upon the leaves, which every one mult becarefull to avoid that it fall not into their eyes or eares, least it put them to much paine, the burres drunke in wine, resisteth the venome of the Scorpion, and other venemous creatures, the young tender leaves boyled in wine, and the eyes bathed therewith that have either rednesse or rheumes false into them helpeth them.

CHAP. XXVIII.

Buxus. The Boxe rice.

He Boxe tree, hath two or three diversities observed therein, which shall be shewed here, and with them another, which divers doe referre hereunto. 1. Buxus arber vulgaris. Our common Boxe tree.

The Boxe tree groweth flowly, and seldome groweth to any great body, or any great height. but when it is suffered, after a long time rifeth unto twife a mans height, and of the bignesse of mans thigh, with a grayish barke, but in many places very low, spread reasonable well, with

branches, whereon are fet many thicke small, somewhat long and round pointed leaves, abiding alwayes greene, larger, thicker, and greener then any ordinary Mirtle leaves, greater or lesser, as the bushes be in greatnesse, at the foote of the leaves come forth small greenish flowers, which turne into whitish round berries, with four points at the toppes, with reddiff feede within them: the wood is very folid close, of a whitish yellow colour, and so heavy that it finketh being put into water.

2. Buxus auratus. Guilded Boxe.

This guilded Boxe groweth in like manner as the former, in some places taller and greater then in others, the leaves are altogether like it, but that most of the upper leaves in the Summer time will have a yellow lift or guard about the edges, and in nothing else differing from the other.

3. Chamelaxiu minor. Small low Boxe.

This small Boxe groweth never high or great, and although neglected or suffered yet still it hath many slender twigs rifing from the roote, and every branch apt to take roote, whereby it may quickely be propagated and encreased, the leaves are much smaller and finer then in the former, and of a deeper greene colour, which never bore

flower or feede that I could observe or learne. . Pfeudo chamabuxus. The bastard low Boxe.

This small low plant lyest most on the ground, with the slender rushlike greene branches, rooting as it spreadeth, and not rising a foote high having divers thicke hard leaves set theron without order, somewhat like unto Boxe leaves, or rather Mirtle leaves, being for the most part pointed at the ends, ever abiding greene: at the ends of the branches among the leaves come forth foure or five flowers of the fathion of Peafe or Broom blotfores, the uppermost pare whereof is whitish, and yellowish in the middle, but purplish lower, and in some purple above, and yellow below, after which come small flat cods like unto the broad Thiasis, containing within them blackish gray round seede like Vetches: the roote spreadeth tough long branches in the ground, and abideth long. The Place and Time.

The first is found with us in many woods, and wood grounds among other sorts of trees, it is also planted in divers Orchards, or house backe sides, where it never groweth high, but serveth as a bush to dry Linnen on, &c. The second hath beene likewise found in sundry places of this land, but onely necre those that have it. The third groweth also in gardens being planted either as a border to keepeup the beds, or as a hedge likewise to dry cloths on. The last Clusius found in fundry places of Austria, and Hungaria. and Cordus on the hils in Bavaria, Occ. The Names.

Boxe is called πύξ@- in Greeke shà το πυκιδιν τὰ ξύλα adensitate ligni dicitur, and Buxus in Latine, and therefrom came pixides the small vessels or boxes to hold and containe things in them. Theophrastus and Diescorides have but one fort, but Pliny hath three, the first he calleth Gallium, because it was made to grow into spires or pillars, unto a great height. The second Oleastrum, (but as Dalechampins on Pliny noteth, there is an errour in the millaking of the word, in fome Greeke copy that he followed, and for dyesopon were, fecundum omnino agreste effe, he tooke it to be 2 yelano Gran Oleaft am effe) is wholly wild, and not profitable for any thing as the first kind is, being of a most loathsome sent, not fit to set against the house sides, as the third is : Another errour Pliny hath, that he faith the head of feede is called Crategus, which he doth confound out of Theophraftus that speaketh of Cratagus next after Buxus, lib. 3. c. 15. and a third errour herein is, that he faith the Boxe beareth Vijeum on

1. Buxus arbor vulgaris. Our common Boxe tree.

4. Pfendo chamabunus. The baffard low Boxe tree;

the North side, and Hypbear on the South, which Theophrastus faith of the Ilex to doe so. The first is generally called Buxus & arbor, or arborefeen by all, The fecond hath not beene mentioned by any Writer before me. The third is called Chamapyxos by Tragus, and Tabermontanus, and Baxus humilin by Dodonaus. The last is the Anonymos flore Colutae of Clusius, the Anonymos I ervince folio of Camerarius in horto: and Rhus Myresfolius Pliny Gesneri also, Gesner in Collatione stirpium calleth it Chamebuxus, and Bester that let out the great horsus Eystetenfis, Pfeudochamebuxus as I doe. Thalius calleth that fmall plant Myrius tenuifolius, that Cordus calleth in Observationum sylva, Fruticulus exiguns folis myrticis, which is this very plant. Box is called Bosso by the Itulians, and Box by the Spaniards, Boys by the French, Buxbaum by the Germanes, and Palmboum by the Dusch. The Vertues.

The leaves of Box are hot and dry, and aftringent withall, as the tafte declareth, and therefore afforedly doth dry and binde, yet is it not much used in Physicke by any now adayes that I know, although many decirumpet out the praise of it to be good for fluxes, and the French disease, as much as Gnajacum. Fernelins onely doth number theleaves hereof among those things that doe purge, but the practice thereof is worne out of tile, yet I remember that Doctor Smith, that was one of Queene Elizabeths Physitions, appointed the decoction of an cunce of theleaves of Boxe for a purging medicine, to be boyled in whey, and a dramme of the pouther in broth. But Matthiolus contesteth against such as tooke it, and the Guajacum to be both one : the leaves and the dust of the wood boyled in Iye, will make haires of an Aborne (or Abraham) colour, the dwarfe Boxe is fit as is faid to berder the beds of a Garden, &cc. and either they or the leaves of the other dryed and given to horses, cureth them of the Bots, or Wormes: the wood is used for many small workes among the Turners, and the diversified boxe that hathcrooked veines therein, ferveth for inlaying to Joyners: there is no use knowne of the last as yet.

One medicine that I learned of a friend, who had tryed it effectuall, I will here fee downe unto you, to cure the biting of a mad dogge, is to take the leaves and rootes of Cowflips, of the leaves of Boxe and Penny-royall, of each alike quantity, fhred them frallind put them into hot broth, and let it be fo taken three dayes together, and ap-

My the berbe, &cc, to the bitten place, with fope and hogges fuet melted together.

CHALL XXIX.

Salix. The Willow.

He Willowes are to be divided into fundry parts, for fome grow high, fome low, fome with broad leaves, some with narrow and long, and that both high and low, some also onely growing in the waters, others delighting to grow by water fides, and ditches, yet will also grow on the land. I will therefore distribute them into foure peculiar forts or orders, that is to say into those thatgrow high

TRIBE 16.

I. Salixarborea angustifolia alba valgaria. The ordinary great white Willow tree.

3. Salis roles. The Role Willow

and beare narrow leaves, into those that grow high, and beare broad leaves, into the lower fort with broad leaves, and into the lower with narrow leaves, and fo I shall comprehend the whole number of them; and yet I must seperate the Spyraa of Clusius and the Vitex or Agnus raftus into two chapters by the rifelves.

1. Salix arborea angustifolia alba vulgaru. The ordinary great white Willow tree.

Our ordinary white Willow groweth quickely to be a great and tall tree, if it be not lopped as it is usuall in most places, with a smooth white barke on the body and bigger branches, the younger sprigges, being fomewhat greene with the whitenesse, the leaves are long and narrow, pale greene on the upper fide, and of a thining filver white colour underneath, without any dent on the edges, the flowers come forth before the leaves appeare, and are (mall long and round, yellow mossie heads, smelling sweete for the most part, divers standing one above another, on a long stacke, which in time turne unto downe, that is blowne away with the winds, and the feede with it if it have any : the wood is foft and white, and with the branches hereof cut into long stickes are made stakes for hedges, or to uphold Vines, &c.

2. Salex angustifolia purpurea sen nigra. The ordinary blacke Willow.

The blacke Willow differeth from the former white not growing so great or high, and that the barke is more rough and of a darke reddish colour, the branches lithy and casie to bend, as whereof hopes are made to binde caskes, the leaves likewife are narrower and blacker, and wood not so white,

3. Salix Rosea. The Rose Willow.

The Willow that beareth a tuft of small greenish white leaves, on the reddish branches, set in order together almost like a Rose, is in growth like unto the last, the barke as rough and darke, the leaves not so long nor the branches fully fo lithye and pliant, yet reasonably.

4. Salix fragilie. The hard blacke Willow.

This differeth from the fecond, in that the branches are hard and blacke, ftrong, and not pliant as the former, &c. 5. Salix viminalis nigra. The blacke Withy.

This Withy hathmore flender branches, and more fit to be wound of a darke red colour: the leaves are long and narrow, dented about the edges, of a darke greene, and a little white underneath, having two 1 mall round leaves, at the letting on of every the long leaves, which sheweth the kinde thereof. 6, Salix Gallica nigra. The French blacke Withy,

This different from the last in this, that the twigges are more yellowish browne, the leaves lesse dented and hath mail round leaves at the bortome of the longer.

The Place and Time.

Many of thefe forts are found in our owne land in low grounds, neere water courses and direhes, and the Rofe willow in fundry places of Effex, and Cambridge thire: the blotfomes come forth before any leaves appeare, and are in their fullest greatnesse usually before Easter, divers gathering them to decke up their houses on Palme jun-The Names.

It is called in Greeke iria, meed ro inva, quod cito in altum excrescat, and Salia a saliendo in Latine. because it groweth with that speed that it seemeth to leape. The first is common both with us and with other nations and is that which Theophrastus and Pliny call Salix alba, and Salix perticalis by Matthiolin, Cordus, Lugdunensis and others, because the branches thereof being strong are used as stakes to hold up any thing, or to be bound thereunto. The second is taken to be the true Salix Amerinanigra & rubens of Pliny, and of Columbia Salix Amerina & Selina, which Matthiolm calleth Greca, and Dodonaus Gallica, and by Thalism Sabina, and Amerina. The third is not mentioned by any forraigne Authour that I know of, Gerard having given the first knowledge thereof to the world. The fourth is called by Banhimu Salix fragili, as it is in the Title. The sit is called by Lugdmens Salix male by Lugdmens Salix male of the control of the second of the purpose of Pliny. The last is the first Salix of Tragm, the Salix Gallica of Corden on Disservices, and by Lugdenenger Salix Phenicen. The Arabians call the Willow Bulef Bhilles, and Saffaff also, and Chalif, which names Alpinu and Ranwolfius give to their particular kindes, the Ita-lius Salice, the Spaniards Salce, and Salgueiro, the French Saulx, and Saule, the Germanes Weiden and Felbinger, the Dutch Milgheboom. The Vertues!

The Vertues of all the forts of these Willowes, as of the rest are set downe together at the latter end of them, except such as are mentioned in particular.

CHAP. XXX.

Salix arborea latifolia. The Sallow tree.

F this kinde there are divers forts that plainely differre both from the former and among them-

1. Salix latifolia rotunda. The round leafed Sallow. This Sallow groweth to a reasonable greatnesse with a grayish white rugged batke outermost.

and another redder inward, the outermost being pliant, and strong, fit to binde things withall: the leaves hereof are broad and almost round, endented about the edges, darke greene above and gray underneath with two small round leaves joyned to the foore of them: the flowers or catkins are not such whole heads or tufts as the former kinde, but conflict of many small heads, thicke fet together, which are blowne away with the blackish seede in them as the others are: the wood hereof is more loose and spongy then the other, and may by beating the head be writhed round or downeward, as is seene at the Christmas time in many Noble and Gentlemens houses set at their gates by their Porters.

2. Salix latifolia oblongior. The longer leafed Sallow. This other different from the former onely in the leaves, which are not foround, but broad and long withall, dented about the edges, and in all things elfe alike : on the leaves of both these forts are found sometimes certaine bladders or blifters, and upon the busheles little rough balles.

3. Salin latifolia miner, The leffer broad Willow.

There is another fort hereof that groweth not so high as the former, the leaves being of a meane sife, betweene them two that is not fo round not follows, but of a darker greene colour, and gray undern at like unto them.

4. Swing fubros undburgentes folio. The filver leafed Sallow.

This filver leafed Sallow groweth low like the last, having a brownish barke to cover the body, but especially

the branches, the leaves are more long thors broad, and flaining filver-like underneath, formewhat leffer then the late, the leaves and the barke being the chiefoft differences in this from the last.

The Place and Time. These forts although they are so wittimes found by waters sides, yet are they also found in the moister grounds, are neere crookes or ditches, and in about plant grounds as well: their time of flowring is with the former.

The Names. This kinde is called Salix arborea latifolia to distinguish it from all the other kindes: the two first forts are mentioned by Tragus, as his fourth kindly, sire called Latifolia or platiphylles by Clusius, Camerarius, Thalius, Cofur, Lobel, and Lugdanessis, which Tebermontanu and Gerard call Salix caprea recandifolia; and thought to be Eleagum by tome, and called Salix isosfelia aquatics by others. The third a mentioned by Thaline onely,

1. Salix latifolia retunda. The round leafed Sallow. 2. Salix latifolis oblumgior.
The long leafed Sallow.

and by Baubinus from him. The last by Baubinus onely, who calleth it Salix in brotundo argenteo folio, as it is in

CHAP. XXXI.

Salix pumila latifolia. The low broad leafed Willow.

Here are likewise three or soure sorts of this low kinde to shew you, which are as followeth. I. Salix humilis latifolia eretta. The upright low broad Willows The branches of this low Willow are short, not above a cubit long and straked, or as it were crested all along: the leaves are somewhat long with the roundnesse and pointed at the ends, a little wrinckled

above, and fost and woolly underneath: this creepeth not as the next, which distinguisheth it.

2. Salize latifolia repens. Creeping broad leased Willow.

The stalkes with the sundry branches of this low Willow, having a rugged barke, doe for the most part spread on the ground, and take roote againe as they lie, the leaves are small, yet somewhat broad and long, pointed at the ends, greene above and gray underneath and shining, the carkins he, eof are thicker and shorter then in any ether of these lower forts, the rootes hereof spread much in the ground.

3. Salize latifolia Alpinarepens. Creeping mountaine broad leafed Willow.
This other fort differeth little from the last, having a little smoother bark, a few rounder leaves, and smaller catkins, which abide untill Angult, and then thew their small blacke seede within them, and great rootes much spread.

4. Salize faxatilis minima. The least red or stone Willows.

The stocke hereof is thicke at the bottome, but short, sending forth two or three flender short branches, lying on the ground, having long and for ewhat round darke greene leaves thereon, with many veines therein, at the end whereof standetha small round head made of many small graines as it were set together, which when they are ripe open themselves and sheweth forth a short soft white downe, out of a three square huske, which is carryed away with the winde.

5. Salix pumila abortiva. The least Willow without fruite. This Willow groweth not much higher then ones hand with such small round leaves thereon, white on both sides, that they exceede not the bignesse of a penny, standing close together, without either flower or feed, that it can scarie be taken for a Willow.

6. Salix Agyptiaca & Spriaca. The Egiptian Willow or of Spria. This Willow that groweth familiarly both in Egipt and Syria, is needed a thrub then a tree, forcading into many Gender flexible and yellowith branches and flemmes also from the roote, whereon are fet faire broad and large 2,3. Saka humitu laufolu er Alpina repens.
The Creeping broad leafed and mountaine Willow.

TR IBE 16.

6. Salin Ægyptiaca & Syriaca. The Egyptian Willew or of Syria.

leaves on both fides, yet but one at a place, utually, espe-7. Salix Arabica bamilis folije Atriptich. The Arabian dwarfe willow: cially on the younger stemmes and branches, but grow emily on the younger itemmes and oranches, but given finaller on the elder, with fome leffer with them also, greene on the upper fide, and grayish underneath: at every joynt with the leafe usually commeth forth a whitish ball or tust, of a fost flocky substance, which by time is dispersed into the aire, without bearing any feede for ought that hath been observed, yet may be in that flocky matter, as is usuall in many other plants that beare flocky heads: but because the flowers are very plentifull, and sweete withall, the Natives distill a water from them, whereof they make a great account, calling it Machaleb, using it as an especiali helpe for all forto fagues, but especially in pestilential and putride layers, as also the infusion or decoction of the flowers and for paines in the head and faintings of the heart, and the comforting and strengthening thereof.
7. Salix Arabica bumilis folys Atriplicis.

The Arabian dwarfe Willow.
This Arabian likewife groweth low, with many pale yellowish branches, but thicker, more solid and strong then the laft, be fet on all fides with leaves, that are of anhandbreadth long, and two inches broad, somewhat igged on the edges like unto a wild Arrache, what flowers or fruite it bore, was not observed, but of the coles of this fort of Willow, they make their best Gun-

The Place and Time.

Some of these forts are found in many places of this Land, as upon Hampstead Heath, Rumney Marshes and thelike, although Clusius, Lugdunensis, and Bauhinus, have recorded them to grow in Germany, Hungary, and sany, &c. The two last according to their titles.

The Names.

Baubinus calleth the first by the name in the tirle, as he doth the fourth alfo. The second and third Cissius cal. leth Salin pumila latifolia, the third here being his first, and his second, the second here. The fifth Lugamentis calleth abortiva, as it is in the title. The fixt is remembred by Alpinus among his Egiptian plants, calling it Calar five Ban, and Vestingius faith the Egiptians and Syrians call it Caleb allo, Ranwolfins faith the Syrians called it Saffaf. The last Raumolfius, also saith is called Garb by the Arabians, and Garrab by the Moores.

CHAP. XXXII.

Salix pumila angustifolia. Low narrow leased Willowes.

🚅 Ereof there are divers kindes which grow diverfly some in more wet places then others, and first I must speake of the Ofier, because although it grow with longer twigges or roddes, then many of the rest, yet it beareth narrow long leaves. 1. Salix aquatica humilis. The Osier.

The Ofier hath a flumpe or stocke of a tree, as bigge as ones arme at the most, and not above a foote high, put with an head as bigge as a childes head, being kept thus low of purpole, because the shootes or wands that rise out of it, are cut every yeare for use, the barke whereof in some is yellowish or whitish, in others brownish, the leaves are long and narrow, yet broader then any of the rest for the most part that follow, dented about the edges, darke greene on the upper fide, and whitifh underneath: this hath not beene obferved to beare any flowers, because all the shootes are yearely lopped off close to the head, but the rods thrust into the ground will spring to be young trees, to be dressed in like manner, and so will any branch of the former greater forts.

2. Salix pumila angustisolia retta. The straight dwarfe Willow with narrow leaves. The stemmes of this Willow are stender yet upright, not above a foote long, covered with a yellowish barke: the leaves are narrow and long like unto those of Line or Flaxe, greene above and gray below, the young ones being wholly gray and hoary: the bloomings or catkins are loft and yellow, like the greater kindes, and come forth before the leaves, and passe into downe being ripe, that is blowne away with the winde, the roote is

blacke of a fingers bignesse with fibe rs thereat, growing a slope.

3. Salix humilis angustifolia repens. Creeping low Willow with narrow leaves. The branches of this low Willow, grow to be a foote or more long, but flender and leaning, and lying upon the ground, where it will shoote forth rootes againe, set with shorter and narrow leaves, divers comming forth together, greene above and gray below, in other things not unlike the former.

I, Salix aquatica humilic.

2. Sal a pumila angustissia resta. The straight dwarfe Willow with narrow leaves,

Salix oblongo incano acuto folio. The blacke low Willow.

The stemme hereof is covered with a darke red barke, para ted into fundry short branches with narrow long and sharpe pointed darke greene leaves upon them, and hoary under-

neath, the rest agreeth with the former.

5. Salix Helice Theophrasti.

Hungarian low Willow. The branches of this Willow are very flender and pliant, though the body bre 10mewhat great, covered with a pale yellowish barke, the leaves grow by couples, being long tarrow and sharpe pointed, greene with a certaine hoari-messe above and gray underneath, with some small leaves at the bottomes of them, and with small reddish bals or blisters fometimes on them also: the flowers, &c. agree with the former, but this is proper hereunto to have scaly heads of taves at the ends of the branches.

6. Salix Alpina Pyrenea. Low Willow of the Fyreneau hils.

This small Willow riseth unto scarse halfe a cubits height, with flender short branches, full of small long leaves, hairy all upon the edges, and as fost as Velvet, the stake with the catkins thereon are an inch long, being fost and slender, but elfe like the reft.

7. Saline Alpina repens angustifolia non incana,
The greene creeping Willow.

The branches hereof, although fome of them rife above the ground, yet take they roote below, having formewhat broad ad long leaves on them, wholly greene, so that but that the flowers doe appeare like unto the rest, none would take it to be a Willow.

8. Salix angustissimis & longissimis folys.

The longest leafed Willow. This low Willow hath yellowish rods, with the longest serowell leaves of any of the reft, white on both fides, but

Salix Helice Theophafti. Hungarian low Willow.

fome-

fomewhat knobby underneath, this hath also scaly heads of leaves, at the chils of the branches as the fifth. The Place and Time.

The first is alwayes planted in the low grounds that are often overslowen, where it onely will thrive: the one ther fortes forme are found growing with the last fort, or by them in fundry the fall and the like places with us, and in Hungaria, Auftriajerc. as Clusist and Banhinus have let it downe. The Names.

The first is called Salix Vicelina by Cordus on Dioscorides, and by Dedonam, and is the third Salix of Traces and Cefalpium, Gerard calleth it aquatica, as the fittelt name to distinguish it from the rest, and so doe I: It is also called Vincus a vincientle. Lugdanensis maintaineth it to be the Salix Amerina of Pliny, against Ruelius and Marshiolus, he should have said also, who would make the Vitex or Again rafts to be the Salix Amerina of the Latines, because that among the bastard names in Dioscorides, it is there so set downe, but they differ much, as you shall here more in the next Chapter. For Lingdunensis saith that they of Lyoni, and the Mountainers in Savey do call it vet to this day, des Amerines, which they of Parin call Ofiers, and they of Normandy, des Ambres. Some call it yet to this day, and America, which they of an a Salie, would make the slows of Theophrafia to bee America, but I fasot Orfus giveth Vose as he faith, whole liquor he calleth arounds, not unlike to chicke blackish Wine. but enclining more to purple. The fecond is the first pumila angustifelia of Clusius. The third is his second, and the Salis themile repens of Lobel. The fourth is so called by Banhings as it is in she citie. The fifth is taken by Lugdunenfis to be the Salix Helice of Theophrastus, and by Bauhinns, Salix humilie capitale fquammolo. The fixt and seaventh are mentioned onely by Banbinan, and the last by Lugdanensis, and is his firsth fort. Their English names are fitted to every of them, as I thinke is fittelt for them.

The Verines. I thought fit to thew you what particular property is in each of these Willowes altogether, and not to make many places or repetitions. All of these ingenerall are cooling, drying, thickning and bindings both the leaves and the barke, and the leaves are used for any of those effects, as to stanch bleeding of wounds, and at the mouth or note, and pitting of blood, as also al other fluxes of blood in man or woman, and likewise to stay cast. ing, and the define thereunto, if the decoction of them in Wine be drunke: it helpeth allo to flay thinne hot and sharpe, salt, distillations from the head upon the lunges, causing a consumption: the leaves bruised with some pepper and drunke in wine, doe much helpe the winde chollicke, the leaves bruifed and boiled in wine being drunke. doth much flav the heate of luft, and wholly extinguish it, if it be long used both in man and woman, the feede also is of the tame effect. The water that is gathered from the Willow while it flowreth, the barks being flit, and a veffell apt to receive it, being fitted to it, is very good for rednesse, and dimme eye-fight, and filmes that begin to grow over them, and stay the rheumes that fall into them, to provoke urine being stopped if it be drunke, and to cleare the face and skinne, of any spots or discolourings a the flowers faith Galen, have a ftronger effect to dry up any fluxe or humour, being a medicine without any fharpeneffe, and the barke much more, as all barkes now, but if the barke be burnt and nied, it doth yet dry more forcibly, and being mixed with vinegar, it taketh away warts, and cornes, and other the like fieth that groweth on the hands or feete, or other parts: the decoction of the leaves and barke in wine, is good to bathe the finewes, as allo the places pained with the gout and to cleaned the head or other parts of fourfe, the juyce of the leaves and greene barke, mingled with fome Rosewater, and heated in the rinde of a Pomegarnet is singular good to helpe deafenesse to be dropped into the cares: the feede of the blacke Willow mixed with lithurge of filver in equali quantity, made into in oyntment and used on any place where the haire groweth that you would take away, after it hath beene bathed well before, or elfe in the baine or flove doth cause it to fall away. Of the twigges or rods are made many forts of workes, both line and course baskets, chaires, cradles, and many other the like: bands also both greater and leffer, to binde up Vines, Trees, Hedges, and many other things, hoopes allo, and the small twigges, to binde the hoopes stakes also, and poles both high and low, to hold up or fasten hedges, bushes, &c, unto, and many more the like things. Tragus remembreth a presty fained controverfie betweene the Boxe and the Willow, written in the Germane tongue, whether of them were of the better use in the common wealth, or might bell be spared. Of the Sallow especially but of the other Willow trees in generall, the best coles are made to make Gunpouther withall, as is well knowne, and with the coles likewife, the finest Paiaters draw their first draughtes: the Castor or Bever delighteth chiefely to make his residence among the Willowes, and Osiers, in the Waters fides.

CHAP. XXXIIL

Spiraa Theophrafti Clusio, Clusius his spiked Willow of Theophastus.

His strange Willow (for so it is most like) groweth to be a small low bush of three or source foote high spreading forth stender branches covered with a reddish barke, whereon are set without order, many long and narrow leaves most like unto the Willow, of a pale greene colour on the upperfide, and browne underneath, finely dented about the edges, of a drying rafte, with fome bitternesse: at the ends of the branches come forth thick bushing spikes, or clusters of blush coloured flowers, consisting of five leaves a peece, with some threads in the middle, of the same colour, without any sent, which turne into small five square heads with

very small seede like dust within them, of a yellowish colour.

The Place and Time. This was fent out of Silefie to Vienna to Clufius by Sibifius, the Duke of Briga, his learned Apothecaty, where it is most likely it grew, and flowred in May with Clusion, and the feede was ripe in Anguil.

The Names. Clusion faith he that fent it tooke it to be a frecies of Springs, and queltioned Clusion whether it should not bee

tered thereunto, but hee feriously considering thereon, and or finde it like to any plant that he knew, and there-it judged it most necessly to represent the antesia or as, the reade it mipsta of Theophrassus, which hee putteth amag those trees that beare ipikes, as Speirea, Erica, Agnus, alone others lib. 1. c. 23. and with all Cinsim faith that indoth more fitly agree to his Spires, then the Tibernam Muthieli, as some would have it. The Vertues.

There are no property mentioned of this plant, whereunnit might be ferviceable in Phyfick or otherwife, and theremelet this fuffice.

CHAP. X XXIV.

He Chaste tree is of two forts, one with narrower, and another with broader leaves the one dented and the other not, the one with whicish and the other with purplish flowers.

1. Vitex folio another.

I. Vitex folio angusto. Narrow leased Chaste tree.
This rifeth up taller then a shrub, unto the height of a low tree, with divers branches covered with a take coloured barke, and are lithy easie to bend, with sundry large leaves cut or divided like unto Hempe leaves,

sher into five or feven parts or leaves, each of them being long minarrow like Willow leaves but smaller, and not dented at all bout the edges: at the ends of the branches come forth long spikes of flowers, somewhat like unto Lavander spikes, stored with blush white flowers at feverall spaces up to the toppes, after which come isall round feede, of the bigneffe and likeneffe almost of pepper, wheteupen forne have called it Piper agrefte, but neerer unto Counder feede but of a blackish gray colour, and tafting somewhat

2. Vitex folio latiore, The broader leafed Challe tree. This groweth lower and leffer then the former, Having the like aves divided as it, but each somewhat broader, and dented about kedger, more white and woolly also then they, the flowers grow pikes after the same manner, of a blewith purple colour, the ked that followeth is also like the other.

The Place and Time. These grow in the further part of France, in Italy, and Spaine uby by waterfides and in the mailter grounds these colder Counik doe onely nurse them up in Gardens for their farity and use: ey hower in luly, and the feede saripe in August in the naturall Puesbur will hardly flower with us. The Names.

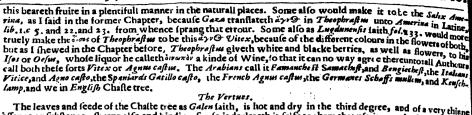

ltis called in Greekea yo , that is, Caffen quod caftitatem confermig quibus aut eftur, aut bibitur, aut substernitur as Galen laith, or "Discorides faith because the Athenian matrons, in their The momia, did u e the se leaves as sheetes to lye upon, thereby to prebretheir challity, the Phylitians and Apothecaries, joyning both words together call it Agenusafin, the Latines also call it Fifex, it slikewise called in Greeke No. G. Lygos quast vimen propter in-Me fere ramorum flexilitatem. Lobel in Adversaria taketh it to & Eleagnus of Theophraffus lib. 4.c. 11. which he faith is like the the America, but beareth no fruite, yet the flower is like the white plat flower, which how it may agree there with I cannot fee, for

Vitex five Agnu castu folio angufto. The Chatte tree.

this

1. Oles fative. The manured Ollive tree. 2. Oka fylvefiru. The wild Ollive tree.

effence or substance, there also and binding, for so it declareth it selfe to them that use it, year the feede is perceived plainely to be so hot that it procureth headache, yet being parched or fryed it will the leffe trouble the head. besides it dissolveth the winde in the stomacke or belly being tresh, but being fryed or parched much more; it restraines hello the insignations to Venery in any manner used and taken: thus farre Galen, unto whom Panlus and Etim doe content affirming the same things. The seede being drunke resistent the bitings of veremous bealts, Spiders or the like, and he peth the dropfie, and those that are troubled with the spleene, it also procureth milke in womens breafts, it procureth their courses, and the urine stopped, if a dramme thereof in pouther be taken in Wise or with Pennyroyall: it troubleth the head and causeth sleepe: the decoction of the herte and seedes is very good for women troubled with the paines of the mother, or inflammations of the pairs : the hot fumes thereof taken underneath is no lesse effectuall; applyed to the head it easeth the paines thereof, and with oyle and winegar, the Lethargy, and Frensie: the same also made into a pulcis with Vine scaves, and applyed to the cods vinegar, the Lettiargy, and Frenite: the same and made into a party with the control of the constitution o w carineffe upon travaile or labour : the leaves are almost as effectuall as the feede, for all the purposes aforesaid. and are good for wounds alfo: the feede used with Barley meale, doth mollific hard swellings, and breake Impollumes: and with nicer and vinegar it helpeth freekles of the face; uted with honey it helpeth the fores in the mouth and throate. Gales although fo famous a writer and Physicion contraryeth himselfe in this one plant once or twif', for having affirmed before that the feede hereof is hot and dry lib. I. Alimentorum, he faith, having spoken of the properties of Hempe seede, that the seede of Virex doth restraine Venereous desires, and giveth little nourishment to the body, and that because it is cooling and drying. In another place be saith (speaking of drechigenes medicines for the headache) among other things, that of the leaves of the Bay tree, the Poplar, and the Vitex or Chaste tree with vinegar and oyle, he made a medicine of differing properties: for the Bay tree leaves are very hot, and those of the Chaste tree moderately cold, and in the means betweene both are the Poplar leaves in both which places you fee he maketh this Chafte tree to be cold, when before he had placed it; not among those that were temperate, but in the third degree of heate e yet some of good Wit to free Calen from this last errour, would invert the Text and fay that the Bay leaves are the hotteff, the Poplar the coldeff, and the Chaffe tree leaves a meane betweene them both.

CHA. XXXV.

Olea. The Ollive tree.

He Ollive is diffinguished into the tame or manured Ollive, and into the wild fort : for although the old Writers as Fliny, Columetta, and others fet downe ten forts, which they called by feverall names, which whether it were in thefe as in the divertities of Vines, wee know not cur climate not fitting their growing, or according to Wines, which according to the feverall climates and foyles, gave fweeter or harfier, weaker or ftronger Wine, one then another, and so greater or lefter Ollives, and sweeter or ftronger oyle one then another a for diversace account

them to be differing in fecie, one from another, as our Apples, Pe ares, and Cherries doe. 1. Olea fativa. The manured Olive tree.

The manured Ollive tree rifeth in some place to be very tall, and very great, like a great Wallnut tree, in others not of halfe that height and greatnesse, with divers armes and branches, not very thickely set together, whereon grow somewhat long and narrow leaves like the Willowes but lesser, and shorter, thicke, fat, and sharp pointed with short foot halfes under them, greenish above and whitish underneath, rever falling off the tree, of a birter talle and iomewhat that withall the bioliomes are many fet together at the joynts with the leaves, small and of a greenish white colour, made of force leaves a peece, after which come round and fomewhat long terries, greene at the first sind changing pale afterwards, and then purplish, and lastly, when they are full ripe, of a deepe blacke, and some white when they are ripe, as Classus saith he observed: some are great others are small, and some of a means site betweene both, some are longer, and some rounder then others, some are fitter to eate, and yeeld not much oyle, others are not to fit to eate, and are fir aller, yeelding moreflore of oyle, teme againe are gathered untipe and pickled up in brine, which are the Ollives we use to eate with meate) others are full red to grow ripe, and then pickled or dryed, and kept all the yeare, to be exten as every one little of those Ollives where of oyle is made, tome oyle will be delicate sweete and neate, others more fairly or full and strong, some upon the taste will leave no bisternesses in the mouth, but will taste as sweete and unpleasing in taste, the wood is faire, firme, and solid full of carld veines, and as approblement in its surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not as the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as dry and will be not a second or the surgence as it is greene as dry, and will not retin a long time.

2. Oleafter five O'ea fylveftett. The wild ? live tree. This wilde Ollive tree groweth fomewhat like unto the manured, but that it hath harder and smaller leaves, and thicker fet on the branches, with fundry harpe thornes among the Igaves : the bloffemes and fruite come

both in the same manner that the other doe, and in as great plenty, yet much leffer, and scarle comming at any the to ripeneffe even in the naturall places, but where they doe being ripe, they are small with crooked pointed and blacke: Of the Ollives hereof is sometimes made oyle, which is colder and more astringent inproperty then be other and harsher in taste, and greenish in colour, but the Ollives are much also respected and gathered to be

The Place and Time.

Both these grow in the warmer Countries onely, neither will they beare fruite in any cold climate, or rather fatfelive out their Winters: the manured as I faid before is wholly planted wherefoever it groweth, where attording to the foyle and climate come greater or leffer Ollives, and more or leffe ftore, sweeter oyle also, or more frong in take. Many doe thinke faith Columella, that the Ollive tree will not grow, or at the least not beare faite if it doe grow, above three score miles from the Sea. For from the Isles in the Meditertenean Sea, as Zante ma Cerigo, &c. is brought the finest and invectest oyle, and from Majorea, &c. a fuller or fatter oyle; from Prof in France a stronger and hotter tasted oyle, then either of them or some others: the wilde Ollive growers. mirally in Spaine, Portugall, Italy, and many other Countries. They flower in Inne and Inly, and have not their huteripe until November, or December, and as Classus in Granado not until February, the wilde in Iannary waster. Virgil shewethin these Verses that the Ollive being planted needeth no further dressing,

Non ulla est Olivis cultura, neque illa Procurvam expectant falcem, raftrofque tenaces, Cum semel haserunt arvis anrasque tulerunt. The Names.

The manured Ollive is called in Grecke in ala nuepo, and Olea Sativa in Latine, the wilde Ollive a yeighala, and dienmedienaia, that is in Latine, Oleafter, or Oleafylveffris Cotinus, and Olea Ethiopica, as Diefcorides whit: the fruite is called in siz, and Oliva in Greeke and Latine, and when they are neere ripe Drupe, and Dranter, and Colymbades when they are pickled or dryed to be eaten, yet the Greekes at this day call them Dermin. The manner to make Oyle as Matthiolus relateth is thus: after the Ollives are gathered they are laid a tale to wither, and afterwards ground in a Mill, and then put into a strong presse, with some hot water powered whem to yeelde out the oyle, which after it hath stood and is settled, the pure oyle is drawne off from the sopre abottome and kept for use. The manner to pickle Ollives to have them keepe their greene colour, is faith Matwhen, to take fix pound of quicke Limestones made into pouther, which dissolved in so much water as may make athinnes, on are to put thereto twelve pounds of fine fifted Oke ashes, dissolved in as much water as will be sufficon, into which you are to put 25. pounds of fresh garhered greene Ollives, and let them lye therein eight or mboures at the molt, to take out their bitterneffe, stirring them a little, and afterwards Washed in many wam, shifted for five dayes together, which are lastly to be put into brine or pickle, wherein some Fennell statkes adleaves have beene put into the boyling, and then put up into woodden or earthen veffels, as you lift. The fore of the cyle is called America in Latine. The gum faith Diofcorides, that the Ethiopian or wilde Ollive doth relate, is yellow, formewhat like unto Scammon, being in small droppes, and is not or sharpe, biting upon the 1440

tonque: but that faith he, which is blackish resembling Gum Ammoniacum, or other gum, and burneth not epon the tongue, is adulterate and false, but saith Marthioliu, this gum is neither brought us now adayes, nor is in on the tongue, is adulterate and Gu.n Elemi is it, but therein faith he they are much deceived, in that it hath no biting tafte in it, and besides it is mo e like unto a Rossen that will melt with the fire, then a Gum which will burne in the fire and will not be dissolved without wine or vinegar, or other such liquor. The Arabims call the manufed Ollive Zarton and Carton, the Italians Olivo domofico, the Spaniards Olivo and Azestuno, the French Olivier, the Germanes Oelbaum, and Olivebaum, the Duich Oliveboom, and We the tame or manured Olive trees the wilde Ollive is called by the Italians Oliva Salvatica, by the Spaniards Azebuche, and Azuche, by the French Olivier fanvage. And we in English the wild Ollive tree. The Vertues.

The greene leaves and branches of the Ollive, but much more of the wilde Ollive doe coole and binde, effective cially the juyce with vinegar, all hot Imposthumes inflammations and swellings, Saint Anthonies fire, fretting and creeping ulcers, cankers in the fiesh or mouth: the same also restraineth the bleeding of wounds, and womens too abounding courses, being applyed to the places: the said juyce dropped into the eyes, stayeth the defillarions of hot rheumes into them, and cleereth the fight from filmes or cloudes that dimme the fight, and any ulcer that doth breede therein, or ulcers that breede in the cares. The pickled Ollives doe stirre up an appetite to meate. and although hard of digestion, yet pleasing to the stomacke, being apt to puttefie therein, are not good for the evelight and breede headache, yet if they be dryed and applyed to fretting or corrhoding ulcers, doth flay them. and taketh away the scarres of carbuncles or plague sores: the pickled Ollives burned, beaten and applyed unto wheales, flay their further encrease, and hinder them from rising and cleanse foule ulcers, helpeth the gums that are loose and spongy, and fasteneth loose teeth. The water that is taken from the greene wood, when it is heated in the fire, healeth the scurfe and scabbes in the head or other parts: the Olive stones being burned are used for the faid purposes, and also to stay foule spreading ulcers, and being mixed with far and meale, they take away the ruggednesse of the nailes. Now to speake of the other parts of the Ollive, which are the oyle and the soote thereof: first the oyle is of divers variable properties, according to the ripenesse or unripenesse of the fruite. whereof it is made, and then of the time and age thereof, and lattly of the washing thereof, from the sale wherewith fome is made, the oyle that is made of unripe Ollives, is more cooling and binding then that which is made of them when they are ripe: which when it is fresh or new is moderately heating and moistening, but if it be old it hath a stronger power to warme and to discusse, which properties are perceived by the sweetenesse, for if the cyle be harsh, it is more cooling then warming: and if that cyle be washed it taketh from it all harshnesse. The greene oyle of unripe Ollives while it is fresh, is most welcome to the stomacke, it strengtheneth the gums, and fasteneth the teeth, if it be held in the mouth for any time, and being drunke it hindereth their much sweating that are given thereunto: the sweete oyle is of most use in Sallets and meates, being most pleasing to the taste. but the older the oyle is, the better it is for medicines, both to warme any part, and to discusse any thing that necdeth it, and to open and moove the belly downewards, and is most effectuall against all poysons, especially those that doe exulcerate the guts, or not being passed downe so low, but yet abiding in the stomacke, it bringeth it up by vomitting, or hindereth the malignity, from further spreading : it is also a principall ingredient into all falves almost, helping as well the forme, as the vertue in working. The foote or dregges of oyle, the older it is the better it is for divers purposes, as to heale the scabbe in man or beast, being used with the decoction of Lupines: it is very profitably used for the ulcers of the fundament or privy parts, with honey wine and vinegar, it healeth wounds, and helpeth the toothache, being held in the mouth, if it be boyled in a copper vessell unto the thickenesse of honey, it bindeth much and is effectuall to all the purposes for which Lycium may be used: but if it be boyled with the juyce of unripe grapes to the thicknesse of honey, and applyed unto aking or corrupt teeth, it will cause them to fall out : if this foote or dregges of oyle be put into that morter that shall parget the walles or floores of your Wardrobs. where you meane to lay any woollen or filken fluffes or garments, in cheftes or preffes, it will not onely preferve the places dry, from gathering moisture, but warme also from over much cold, and will keepe away mothes, wormes, spiders, and slyes, nor will suffer any to breede therein. The gumme of the Ollive tree (whether tame or wilde) is used in ocular medicines to helpe the dimnesse of the eyes: the same also provoketh urine and womens courses, and helpeth the paines of hollow teeth: it causeth abortement, it expelleth the dead childe, and healeth tetters, ring wormes, scabbes and lepry.

CHAP. XXXVI.

Cleafter Cappadocicus. The bastard or sweete wilde Ollive.

He bastard wilde Ollive, (and why I so call it I will shew you by and by) groweth by time to be a great tree, and well spread, whose barke is very rugged on the body, but smooth and whitish on T the armes. which have very strong and sharpe thornes on them, the younger branches having nonet the leaves are set on both sides of them without order, long and narrow, very like unto Willow leaves, but thicker, fofter, and whiter, both the upper and under fide, which enclineth to a filver

shining colour: the flowers grow at the foote of the leaves, being small and of a pale white colour, very sweete and somewhat strong, sensed even a farre of : after the flowers are falne, come round and somewhat long white berries, like unto small Ollive berries, with a point at the ends like unto thornes, with a sweete foft and spungy substance somewhat like a plumme, or the red lujube fruite, having a chanelled hard stone, like an Ollive stone in the middle : but Lugdunenfis faith the berry is as dry, and without fibstance as the Hawthorne, which peradventure is fo in those places neere him, but in the warmer Countries may be such as I have described them, from good Authours that have seene them to be such.

The Place and Time. This groweth as Bellonim faith in divers places in Turkie, as he faw in his travailes through their Countries, and in the hedges of Granado in Spaine, as Clissius observed, and in most Orchards of note in France, Germany, and

other places with us also: and flowreth in the begin-sing of Summer in the warmer Countries, but very he with us the fruiteripeneth in Autumne in Spaine, he with us the trace tipenett in Autumne in Spaine, or, but seldome with its, yet Matthioliss (aith, hee saw fruite on the tree that grew in the Emperours Ochard in Vienna. The Names.

TRIBE 16.

This tree is diverfly taken by divers learned Writers, for Matthiolus calleth it Olea Bohemica, and takethit to be Eleagnin of Theophrastin, because the namebeing deduced from Olea and Agams, the Ollive and the Chaste tree, as like unto them both, this having leaves and branches like the Chaste tree, and berres like the Ollives : but that it cannot be Eleagnue, letme flew you that this is a great tree. Theophra. fusaith it is fruticosa planta, a theubby plant, and asine, he faith the flower of the white Poplar which alknow, dorn grow in spiked heads not scatteringly on the branches, and lastly he saith, it beareth no fruit, and this is plentifull in any of those places, where The. whraffer chiefly gathered his knowledge of this and other Plants, and therefore as Theophraftus faith, bemolike unto the kindes of Willowes, it is most mobable to a kinde of Willow, which are thought to bere no feede or fruite, and therefore Amaim Lufita. so would make it to be Salix America, without any goodground or reason. Bellonius, Clasius, and Camewing call it Ziziphiu alba Columelle, whereunto it is very like: Gefner also in bartis so calling it, and Olesfrifpecies quibufdam alfo: Bellonius, Dodonaus, and Luedunenses, take it to be the Ziziphus Cappadocica Pling, which it is very probable to be also, Lobel calleth i: Olea (glvestris Septemtrionalium, and Aleaonus alfo and some likewise Olea Germanica, but in my opinion Lobel and Banhinus, and those in Gesners time do one neerest unto the name, whereby it may be most mely called Olea (ylve firis or Oleaster, which I have

followed and added Cappadociess. because that in leafe it doth more neerely res mble the Ollive tree, then the lajuhe, and that it is more naturall to be of Cappadocia then Bohemia, or any of these Northerly Regions: some allo call it Arbor Paradifea, and some Thuia oderata, and some take it to be the Barba Iovis of Pliny lib. 6, c.18. Rauwolfius faith it is called in Syria Seifefan.

The Vertues. We have no especiall Physicall property alotted unto this tree, or the fruite, but that as Bellenius and Clusius brerecorded, the fruite is eaten by the people where they grow, with delight and pleafure, and without any offenfive quality. The flowers as Lugdunenfis sheweth, might be employed to perfume gloves, or garments, or wedistilled into a sweete water as well as the flowers of Calef. which Bellunensis tooke to be this tree, and are uled in the manner aforefaid.

CHAP. XXXVII.

Oenoplia spinosa & non spinosa sive Napeca sive Ziziphu alba The white Insube tree, with thornes and without.

N regard that this tree doth so neere resen ble the other Injube tree, mentioned here before in this Worke, I might have joyned them together, but that I could not assure it you to be of the same property, have therefore reserved it for this place, as partly partaking with the Ollive as the Injube tree, and is of two forts, the one bearing thornes, and the other none, in all other things so like, that one description may serve them both. It groweth to be a tree as great as a meane slied Peare-spinosa of the whose body and branches are covered with a whirsh as the coloured banke, full of small short and sharpe non spinosa the work of the contract of the same spinosa of the contract of the same spinosa of the same spin tikes or thornes, two fer at each leafe not farre in funder, in the one fort, and without any in the other: the bresate somewhat broad and short, very like to the leaves of the other Injube tree but greater, round pointed by the most part, with three ribbes in each, tunning all the length, of a darke shining greene colour on the upper be, and somewhat tending to an ash-colour underreath, slanding singly at the branches, one on this side and mother on that up to the toppe; at the joynts with the leaves come forth divers small greenish white flowers, Bethe bloffomes of the Ollive or Injube tree for the forme, each flanding on its owne small footestalke, after which being faine come many small round fruite, as bigge as a great Cherry, yet semetimes as great as a Wallmin some whitish in others more yellow, and reddish on the one side like an Ar ple, of a very sweete taste, with lone in the middle thereof, like an Ollive stone, but round and not long. The Place and Time.

Thele grow in Spria, Egipt, Arabia, and the parts neere unto them, where they hold their greene leaves all the Winter,

Olesher Cappadi sicas. The baftard or fweete wilce Ollive.

Winter without falling, but in Candy, and other the hether parts, they have beene observed to fall off, as other trees doe: they beare in the warmer Countries twise a yeare, yet the former fruite that commeth in the Spring of the yeare, seldome commeth to maturity, because the mossure of the time spoyleth them, that they doe not ripen kindly, but in the Autumne the fruite is ripe and delicate.

The Names.

That fort which is without thornes is described by Alpinus in his Booke of Egiptian plants, who calleth it Nabea Palsarus Athenai credita, and very truely for Athenam in the foureteenth Booke of Deipnosophistes, calleth it Paliurus, and faith that Agathocles, in the third Booke of his History, describeth it by the name of Connarm, as those of Alexandria called it, and by Honorius Bellus that fent the fruite to Clufius, as it is for downe in his fifth Epiftle to him called Ocnoplia (pinofa. That without thorne is fet forth by Clufine, in his History of plants; as he received it also from Honorius Bellus of Candy, who calleth it Oenoplisses Napeca Bellony Connarus Alexandeinerum force Athenai: Serapio comprehendeth them both under the name of Sadar or Sudar, but as his manner is in other things, he confoundeth it with the Lotus of Dioscorides, from which it much differeth, it is called in Syria and Egipe, Nep and Nap. and as Guilandinus faith, put by many among the forts of Injubes. But Pling feemeth to call it Prunus Agyptiaca, an Egiptian Plumme.

The Vertues.

The fruite of both these before they are ripe, are cold and dry in the first degree, and binding, but when they are ripe they have some moisture in them, and are much used to strengthen the loosenesse of the stormacke and belly, by the juyce of them being taken at the mouth or given in a glister: the dryed fruit insused in water, and the insusion taken, is profitable against the slipperinesse and ulcers of the bowels, the decocti-

on or infulion of the ripe fruite, being dryed is of great use against pestilential feavers, for the fruite is held to have a wonderfull property against venomous qualities, and to resist purrefaction, and mightily to strengthen to heart: the juyee of the fruite when it is throughly ripe, is very good to purge choller from the stomacke, and the first conduits of the veines: as also in all putride feavers, an infusion of them is familiarly taken to coole the heare and violence thereof.

Azadarach Avicenna. The Bead tree.

Lthough this tree be in forme much diff ring from any of the last forts, yet because some have called it Ziziphin, as they did the last save one. I thought it not amisse to insert it in this place, whose description is on this manner. It groweth to be high and vaste, spreading far and making a goodly shadow in the warme Countries where it best prospereth, the body and greater boughes are covered with a ranged barke and full of chinkes, but that on the younger barnches, is smooth somewhat like unto those of the Figge: the leaves are very largely spread and winged, having long some

fialkes, somewhat like unto Ashen leaves, but larger, more spread and of a darke greene colour, dented about the edges, the end leafe being longest, yet in some places they are not so largely spread, from the soote whereof come forth long stalkes, bearing sundry blewish flowers laid open, with five small narrow leaves like a starre, and a small hollow cup more purple in the middle, after which come round fruite, of the bigness of a Cherry, greene at the first, and white when it is ripe, of a sweetish taste at the first, but after very bitter, unpleasing loathsome, and slincking, containing a stone within it size square, somewhat like unto the Emblick Myrablash stone, with two kernels within each, from whence usually rise two sproutes or stalkes of greene leaves, the fruite being drilled (which will be easily done, not being very hard) and drawne on stringes, screepeople beyond Sea to number their prayers on, least they forget themselves and give God too many: this looseth all his leaves in Winter, fresh arising in the Spring.

The Place and Time.

This groweth in none of these Christian Countries naturally, but are all planted wheresoever they grow, in Orchards or Court yards, for the shadow sake, being of little use beside, Classin saith he saw divers of them in Spaine, and heard they were more frequent in Isaly, it slowresh in Isase, and the fruite is ripe in September.

In

Napeca Nabea ant Ocnopies frinofa.
The white lujube tree with thornes.

TRIBLIG.

This was called Ziziphm eandida, by the Herba-tifts at Mampelior as Lobel faith, and Sycomorus by Italians, as Matthiolm faith, but misliking that title he called it P (endo /ycomorus, yet in other places of Italy it is still called Perlaro. Cordus, Gefner in bortis, and Bellonius call it Sycomorus Italorum, Lugdunensis set-tethit downe by the name of Ziziphus alba. Gesner fish some learned men called it Myxus alba & Lanrus Graca Plany. Casalpinus tooke it to be Tuher candide, of Pliny, and peradventure Zizipha Columelle, Defences hath it under the name of Azzdarach, and Chave Clusius and Camerarius, Come Turkes in these daves call it Thefpic, and Ranwolfins faith that they of Tripblicall it Zenfelacht, but generally now adayes, with most Aradarath or Asederaeth, yet the French call it Arbor fautta, because as is before shewed, the fraite helpeth their devotions, as the Spaniards doe, that call it Arbol parayfo.

The Vertues.

The best use that this serveth for is, that the distilled water thereof will kill Lice, and causeth the haire myow faire and long, if it bee mixed with white wine, and the headed washed therewith, the fruite is dangerous if not deadly, if it bee eaten causing the like symptomes that the Oleander doth, and is to be tomedyed with the same helpes: Rannossins saith, that it will kill dogges, if it bee given them with their meater.

Azaderaeth berbartorum. The Bead tree.

CHAP. XXXIX.

Phillyrea. Mocke Privet.

F this kinde of fixub there are foure or five forts each differing from other in the broadnelle or marrownesse of their leaves especially, as you shall heare.

This first Mocke Privet riseth up with sundry stemmes, of the thickenesse of ones thumbe, covered what a greenish barke spotted with white: the leaves are set to ye couples at the joynts, all along the branches, which are somewhat thicke, hard, and prickely, dented about the edges very like the leaves of the Scarlet Oke bush busgreater: the flowers come forth at the joynts of the leaves, the fruite is small, and blacke round berries hanging downe about the branches, and are like unto the berries of Privet, or of the Masticke tree, but having a small slone within them.

2. Phillyreafolio lato ferrato. Toothed Mocke Privet.

This other Mocke Privet groweth greater and higher, whose branches are covered with a whitish barke, having somewhat broad and hard blackish greene leaves, pointed at the ends and dented about the edges, two always scear a joyat, of a little sharpe and bitter taste. The flowers grow at the joyats with the leaves, as in the somer, and the betries that follow are blacke and round like Pepper or Mircle berries, with a thin brittle sheld some within it.

3. Phillyrealasifelia fully fore non ferratis. The greater Mocke Privet with leffedented leaves.

This Mocke Privet groweth lower then the laft, yet unto two mens height, with a whitish barke covering the transless in the last, but somewhat more rugged. The leaves are set on the branches in the same manner as the somethat somewhat narrows, and but seldome dented at all about the edges, the flowers are of a whitish green soon, thanking thicke together, about the setting on of the leaves, somewhat like unto the Ollive blossomes, aster which come round betries like the last.

This is a low buth not exceeding a mans height, but fuller of branches, yet smaller then the last, and covered with a blacker barke a the leaves are narrower and greener then it, like unto the wild Ollive, and not without lose bitter refie in them a the flowers are white and grow after the same fathion, thicke fee together, unto which bring faine succeede blacker round berries like unto Mirtle berries, with a hard stotic in them.

This other Mocke Privet shooteth forth many more suckers from the roote, which are slenderer and not very

TRIBE 16.

1. Phillyrea latifolia aculeata, Prickely Mecke Privet.

4. Phillyrea anguftifolia prima.
The first parrow leafed Mocke Privet.

2.3. 5. Philly folio late ferrato, or fere non ferrato, or anguftifolia fecundas. Toothed Mocke Privet, and

easie to breake, nor so plentifull or thicke growing as the former, with leaves fet one against another, narrower, with less dented leaves, and the other narrow leased Mock Privet longer, and of a darker greene colour, this was faid to beare neither flower nor seede, which matter is disproved, and found to beare both, and like unto the last.

The Place and Time. Clusius observed these five torts in Spaine, Portugall, and France. They flower in the spring, and their berries are not ripe untill it be very late in the yeare.

The Names.

Divers learned men did take the prantes. Phillyra of Thesphraftus, which we have shewed you to be the Line tree, to be this stanged Phillyrea of Dioscorides, being deceived by the vicinity of the names, untill Cordur, who better confidered them, found them much to differ, as well in forme as in properties, fince whose time all that have followed him have to accounted of them. Lobel faith, he would rather read it PINENALL OF Olea amasia, a kinde of wilde Ollive, whereunto it is most like, or little differing : The first is the fielt Phillyrea described by Clusius, and so is my second his second Phi yrea also: The third is the first Phillyrea of Matthiolus and Lobel, and the third with Clufim, and is the Phillyrea of Bellonius, and Gefner in hortis, Dodoness calleth it Cyprus latiore folio, and Lugdunensis Alaternus majer Dalech mpy, and of Cafalpinus Ilatrum, and Phillyra of I heophrastus, Baubinus calleth it Phillyrea folio Ligustri. The fourth is the fourth Phillyrea of Clasius, the Phillyrea anquiftifolia of Lobel, the Alaternus miner Dalechampy of Lugdenensis, and the Cyprus of Dodonaus. The last is Clafin his fifth Phillyrea also, and both these last are called by Lobel Narbonensis.

The Vertues. The leaves of this Mocke Privet are binding, as Dioscorides faith, and are of the same effect that the wilde Ollive

offobeing drunke provoketh urine and womens courles.

CHAP. XL.

Alaternu Gue Philyca Theophrasti credita. Ever greene Privet.

Here is so great affinity betweene the former Mocke Privet, and this ever greene Privet, that divers good Authours call the one by the others name, as you have in part heard in the former Chapter, and shall more in this, whereof there are two forts a greater and a leffe. 1. Alaternus major seu prior. The greater ever greene Privet.

The former of these two shrubs, groweth sometimes tall like a tree, with long but not any great branches, nor yet much divided into lefter ones, and are covered with a whitifu greene bark, and with another yellowish one under it, or more inward, whereon grow somewhat broad leaves without any order, of a meane fife betweene the Ollive, and the ever greene Oke, but thicker, and slightly dented about the edges, and of a darke greene colour, of an unpleasant talte, and bitterish withall, the Rowers are many tusting together at the setting mof the leaves, and are of a whitish greene colour, there hath not beene any fruite observed to follow them, Alaternia minor fewelter. The leffer ever greene Privet.

This other groweth lower by much, with a whitiff greene reddiff barke mingled, the leaves are lefter to the der, and dented about the edges, and of a paler greene colour, the flowers are greater and greener, fer together like the former, unto which fucceeds fmall round berries, greene at the first, reddish afterwaards, and blacketh when they are ripe, having three (tonesor feedes within each of them.

Both these were observed by Clusius in Spaine and Portugall. They flower there in their naturall place in Res brary, and the fruite is ripe in May. The Names.

Pliny calleth this Marcenin quaft inter Olean & Illeem media, Bellonius in his first booke of Observations and 43 Chapter faith, that there is none in mount Ashos but knoweth the true name of that tree, that Pliny calleth Alaiennes, to be the Philysa of Theophraffun, but those of Coreyra and Candy, call it is also the Eleptonic. It is the first Alatornun of Cluffen, and the Alaternun Plini of Lobel, Gafalpinun as Baubinun faith, bur I zhinke rather is should be Lugdenersis, calleth it Celastrus mas Theophrasti, and Casalpinus Phillyra mas Theophrasti: Lugdenensis uketh it to be Aphares Theophrasti, which they of Mompelier call, as faith Lobel, Bourgespine some also call it Phi-

1. Alaternus major. The greater ever greene Privet.

2. Alaternue miner. The leffer ever greene Privet.

Irrea. The other is called by Clufius Alaternus alter, by Lugdanenfis, Celefirm famina Theophrafis, and both of them Phillyrea by Baubina, not giving any peculiar title to Alaternus, it is likewise, the Placeinium Aliangua, catha Theophrafis, as Lugdanenfis taketh it. fome read Lacera, who faith it differest much from all the other force of wilde Cherries, both in the forme of the leaves, bitternesses of the fact, and Ilarmus faite at Historius, from the word Herro, whereby the Italians of Lucca call it as Clufius soils, but Angilians saith Alaterno, and Linterno, as Bourges pine is by the French as Lebel saith, and yet I finde that name given to many other plants, but Dalader and Sanguin blane, as Bellonius saith, for as Clufius saith, the Portugalls call the sinfle Caseca, and the other Filiguero, and Sanguin blane.

The Vertues.

Theophrassus saith that Philyea hath the priority to feede sheepe in that it is ever greene. And Clussus saith that the Portugals use the barke to due their nets into a red colour, and with the chips of the wood which are whitlin they due a blackish blew colour.

CHAP. XLI.

Liguftrum. Privet.

Ecause our Privet hath beene so often mistaken by many for the Cypens of Dissertides, Pliny being the first Authour of the errour, who although 1th. 12.6.25. he suith that Cypens is a tree that growell in Egipt, with a white sweete slower; and Coriander like seede, yet presently after he suith, that some take this to be the same, which is called Ligustrum in Itasy, and 1th. 14. c. 10. hee saith plaintly that Ligustrum is the same tree that Cypens is in the East. I thinke it fit to joyne that Cipens of the East in this Chapter with the other forts of Privet that you may plaintly know the diversity, and that all further controversies may case.

I. Lignftenm vulgare. Our common Privet.

Our common Privet groweth not into any great bodyed tree, but yet it is carryed up with the many siender branches to a reasonable height and breadth to cover Arbours. Bowres, and Banquetting houses, and brought wrought and cut into many formes of men, horses, birdes, &c.as the workeman list supported at the first with timber, poles, and the like, but afterwards groweth strong of it selfe, sufficient to hold it in the forme it is made into a; it beareth long and narrow darke greene leaves by couples, and sweete smelling white slowers in tusts at the

z. Ligaffrum valgare. Our common Privet. 3. Ligafirum Orientale frue Cypra Diofeorida & Plinij. The Easterne ever greene Privers.

ends of the branches, which turne into small blacke berries that have a purplish juyce within them, and some seedes that are flat on the one side with a hole or denotherein. Tragms saith that there is some found that beareth Alicense a yellow flower, but is very rare to finde differing in nothing else, which peradventure may be that other fore may be that other fore missing.

2. Ligustrum myreifolium Italicum. The Italian Mittleleased Privet.

This groweth in the fame manner that the former doth, and spreading into branches that are round and somewhat reddish, the leaves are both longer and broader, comming neere unto the greatest Mirtle leaves, and of a darke greene colour.

This East Country Privet. if it be suffered to grow at large without pruining, groweth to be as great as the pomegarnet tree, whose body and branches are covered with a whitish ash-coloured barke: the leaves are somewhat like unto thise of the former common Privet, but whiter, broader and more pointed, growing many set onboth sides of a stalke below, but singly up to the toppe at the joynts among the branches of flowers, which grow in a loose tust, somewhat platefuly, constiting of soure small grayish ash-coloured leaves, of a very sharpe and quicke sent, sare beyond the Privet flowers, after which succeede small round and white heads, somewhat like unto Coriander seede, with three or soure blackish seedes within them: the leaves fall not of in Winter nour Privet doe, but abide on sresh all the Winter long, of which and the young branches being dryed and ground stop pouther, is made a great merchandise through all the parts of the Turkish Empire, and some of his bordering neighbours also, to give a yellow colour to their haire, hands, nailes, and bodies too, as also for their horses maines and tailes. For the more pompe on seltivall dayes: of the rootes saith Rannolsius being burnt, the Arabians make their Spodium, whereof Avicen speaketh esp. 617.

The Place and Time.

Our common Privet groweth in our owne Land, in divers woods, the next was sent from Padoa and Venice, the last groweth in Egipt plentifully, in Tripoli also and Syria, in sindry places: our Privet flowreth in June and July, the berries are ripe in Angust and September: the last flowreth late even in the warme countries, and the sederipeneth accordingly: the other hath not as yet beene discerned so exactly.

The Names This our ordinary Privet as I said before, was usually taken by Tragus, Cordus, Ruellius, Matthiolus, Amain Lustianus, and Anguilara who yet doubteth of it, to be the wares Cyprus of Dioseorides, which Pliny also nameth, but Fuch fins as I take it, first doubted of it, and denyed it to be Cyprus, and denyeth also that it is certainelyknowne by what name the Ligustrum of the Latines was knowne to the Greekes, and therefore Dodoneus atter Angulara, doc appoint Philippea to be it : but Pliny in laying Ligustrum is the same tree, that Cyprus is in the East, as is before said, bred this errour in so many : but Cyprus of Dioscorides is said by him to be a tree, but Privet is not fo, it is a tree growing in Egipt faith Pliny, the belt is in Canope and Afcalone faith Diofeorides, whereby they both judged it to be a ftrange tree, and not naturall of Italy, as Ligafrum Privet is. It hath faith Disferrids Ollive like leaves but broader, fofter, and greener, Pliny faith like lujube leaves, but Privet leaves are neither broader nor fofter then the leaves of the Ollive tree, the feede faid Pliny, is like Coriander feede, which is meant by the whole feede, with the outer huske on it, for the feede within them is blacke, as Diofcorides compareth them to the feede of the Elder berries: the leaves also doe abide alwaies greene, but in Privet they doe not io: the leaves faith Diefeorides doe give a reddish yellow colour to the haire, if they be moissned with the juyce of Struthing (but not of Struthei mali which is the Quince) before it be applied, but Privet giveth no such colour how foever used: by all which notes it is evident that Lignfrym and Cypras be different one from the other, aideannot be both one plant, or hereafter to be confounded together as formerly, they have beene. The first is schnowledged by the name of Lightrum by all Writers, although tome as I faid would make it also to be Cyprus of Dioscorides, and some to be Phillyrea as is before said. The second Banbinus calleth Ligastrum in resistant la thicum, and saith it was sent him by the name of Myrtus ligastri folio The sait Banbinus calleth Ligastrum & entiacum latifolium, because he maketh two forts of this one, as he doth in stany other things before, making thirof Ranvolfius, fet forth in Bellonius his Observations by Clusius, to be one fort, and that of Alpinus another, entituled angustifolium, because Alpinus his figure (as molt of his others are) is not to exactly drawne, as Clufus faith it should be: he faith also that it is set forth in the history of the East Indies part, 4: foura cab 1 5. under the name of Mangostans: but the truth is, they were both entended but for one plant, Alpinas faith that the Egiptions doe now adayes call it Elbanne, and Avicen with the Arabians, Alcanne and Henne, the Greekes now Mayer Schouns as Ranwolfins taith. The Italians call the ordinary Privet Ginftvice, Olivella Olivera, and Chaminfens, the Spaniards Alfens and Albens, the French Troefus, the Germanes Rhein weighen, Bejubeli Linguind Mundblie, the Dutch Keelernyt, and we in English Prime or Privet, and of Some Printe print.

The Vertue!.

Although our ordinary Privet is little used in physick with us in these times, more then to be pit into lotic as much some and fore mouthes, and to coole inflammations and dry up fluxes, yet Massbolus: said that Privet seven to all the rise, for which Cyprus or the East Privet is appointed by Disseview and Galen: be further said, but the oyle that is spide of the flowers of Privet infused therein and set in the Saine, is single for the first the first of the inflammations of wounds, and for the headache comming from choller or an hor cause? I water also that is succeeded the flowers, that is good for all those disasses that neede cooling and drying, and therefore helpeth all success of chestomacke of belly, bloody flixes and womens course; if it is either drunke or applyed, as also such that void blood at the mouth, or at any other place, and for defillations and rhemmes into the eyes, facility it is be used with Tailous. All these properties may safely be transferred to the East Priver, saving the trunce of social acoustic constitution of a success and branches are of a mixt temper, for it bath a digesting faculty with the warme watery substance and drying, where they it helpeth those places that are burnt, and cooleth hot Impositumes and fores, and dothers without any subsourany share also to helpe the moist sweatings and stinke of the secre, by applying them as a plaister mixed spatial works where the Olema Cyprins that is sweete and made thereof, doth warms and mollise the nerves affines.

Celastrus Theophrasti. The Staffe tree.

His tree groweth up to a meane height, the barke of the body and elder boughes being of a darke co-Celaftrus Theophrafti. The Staffe tree. lour, and the younger greene, whereon are divers leaves, not greater then those of the fruite-lesse Privet, and divers smaller, of a sad greene

fhining colour on the upper fide, and paler un-derneath, which are little or nothing snipped about the edges, and of a little bitter talte : at the foote of the leaves towards the ends of the youngest branches come forth short stalkes of an inch long, sustaining five or fixe flowers, confissing of foure yellowish greene leaves a pecce, which turne into imall berries, of the bignesse of Asparagus berries, greene at the first, and as red as the Asparagus afterwards, but growing ripe are very blacke, and fomewhat long with the roundhesse, wherein is contained a three square seed, like unto a Grape kernell, whose she'l being hard hath as white a firme kernell within it as the hafell nut, covered with a faffron like yellowith skin.

CHAP.42.

The Place and Time.

This grew at Leiden in the publike garden, but from whence the naturall place is is not knowne: but from them hath beene communicated unto divers in this Land, as well as in others: the flowers doe often appeare fo late that the fruite cannot come to ripenesse, yet it is signified that the first tire fruite that was seene growing thereon was in August.
The Names.

Although Lugdunensis referre the winders or ennages of Theophrastus (for he hath both words) unto the Alaternus of two forts that Clusius hath let forth, as is before shewed you, yet Clufius himselfe judgeth this tree to come neerer thereunto, then either of them, and so setteth it downe in his Cu-ra posteriores, some as he saith would make it a kinde of Laurm Tinus, but that it cannot be: I doe not find that Baubium who fetterh downe all other mens observations, bath once remembred this plant to referre it to any other, of

make it one of it felfe, which is not usuall with him in many other that I know. The Utrenes.

Theophrastus recounteth all the properties hereof, whereunto it is put and that saith he is to make staves for old mening other having made triall of any other faculty it is endued withall.

CHAP. XLIII.

Viburnum. The pliant mealy tree.

His pliant tree hath from a small body, rifing to the height of a hedge tree or bush, covered with a darke grayish barke, sundry small (or not great) short, but very tough & pliant branches, of a fingers thick-

nesse, whose barke is smooth and whitish, whereon grow broad leaves like unto the Elme, but somewhat long and hoary rough, thicke, white like meale, and a little hairy withall, fet by couples, finely dented about the edges : at the ends of the branches ftand large tufts or clusters of white flowers, which turne into large bun-ches of round and flat feed like unto Lentils but greater, greene at the first, and red afterwards, but blacke when they are ripe: the branches herof are so tough and strong withall, that they serve better for bands to tye bundels or any other thing withall, or to make wreathes to hold together the gates of their fields, then either withy or any other the like.

The Place and Time. It groweth as a bedge bush, being often cut and plash. ed by the Countrymen, to spread on the hedgesin length to hinder it of the height, and is found very much in Kent, and in other thires of the land. And flowreth not until the end of May, and ripeneth the fruite in September.

TRIBE 16.

The Theater of Plants.

Сна Р.44.

1449

The Names.

Although the fignification of Viburnum, doth properly entend the young twigge or shoote from the roote of a Although the Indication of Distribution, doth properly entend the young twigge or induce from the roote of a mee, yet it is not improbable that Virgit in citing these verses. Quantum lents felent inter Viburna Cupression, shall meane this tree also, called Viburnum, (that it might hold his comparison to the Cypresse, of the meanenes of other Cities unto the statelines of Rome) as divers learned men think, which are Gesner, Matthiolus, Camerarius, Of other and Lugdanensis, oc. and because that the Italians in their vulgar tongue; call it Lantana (quod lenti funt Description of Theophrass and Dioscorides, faith he found it without Paris, which the Country people called Blanche putain, and both he and Lobel doe call it Vierna Gallerum, as peradventure derived from Viburnum, and yet they call another ramping bulb Viorna allo, which I have shewed you before among the clamberers, to be the Arragene of Theophraftus, unlesse the French have two Viorna's, which is doubtfull, for Ruelliss sheweth a shrub, which he faith the French call Blanche putane, and is the fame they call, faith he, Viorne and Hardeau alfo, Lugdanenfis faith that Dalechampiss did take this to be the Speirea Theophrasti, because the pliant tough twigges may be writhed (infirm) into wreathes or round circles: but as I shewed you before, Clusims setteth forth another Speires, which he taketh to be the truer. Cesalpinus and Knellius, doe both thinke it to be the Rhun Theophrassi, lib. 3.c. 18 which Gaza translateth Fluida from the Greeke word its, but as they thinke is no fort of our Rhu, C. Sumacke, beanie he there describeth it with the leafe of the Elme, but longer, &c. and therefore they both referre it to this plant. Matthiolus faith, he was also of that opinion untill having better perused Theophrastum, he refused that opinion, acknowledging himselfe to have beene in an errour. The Italians as I said, call it Lantana; and Viburthe French Vienne, as Ruelling faith, and Hardean alfo, from the French word Hard, which fignifieth a band or tope, the Germaner call it in some places Schlingbaum, but Tragus and Lonicerus, Kleiner Malbaum, Gerard allethit in English the Waifaring tree, but I know no travailer doth take either pleasure or profit by it, more ben by any other of the hedge trees. I have therefore from Tragus his mealy tree, put to the pitantneffe of the wigges and branches, and called it the pliant mealy tree. The Vertues.

The leaves of this tree are harfh and binding, and are good to ftrengthen and faften loofe treth: the decoffimost the leaves hereof, and of Ollive leaves together in vinegar and water, is of excellent good use to wall the mouth and throate that are swelled by harper heumes falling into them, it is good also to set the Vulla or palate of the mouth into the right place, and to flay rheumes that doe fall upon the jawes : the kernels of the fruite hereof taken before they are ripe, dryed and made into pouther and drunke, doe flay the loofeneffe of the belly, and all other fluxes. Of the rootes being steeped under the ground, and then boyled, and beaten a long time afterward, is made Birdlime, with which Fowlers use to catch smaller birds: the leaves boyled in lye, and the head of hires washed therewith doth keepe them from falling, and will make the haires blacke.

CHAP. X LI V.

Here are three or foure forts of Sumacke to shew you, three of them of auncient knowledge and use, but one other of later invention: whereunto I must adjoyne another plant, which both for the sake, and some likenesse thereunto, hath caused divers learned.

The Coriars Sumacke in some places rifeth to be a reasonable great tree (but in dry barren grounds not above twoor three cubits high, or where it is yearely or every other yeare pruined for the profit made of them) foreading fundry branches with large winged leaves, that is many fet on both fides of a middle ribbe, each of them dented about the edges, Theophraften compareth them to Elme leaves, but leffer and longer, and Dioscorides to theleaves of the Hex: at the ends of the branches come forth large spiked clusters of whitish flowers, which therwards become reddiffyround and flat feede like unto Lentils, with an outward skinny huske, which was, and is yet fill in divers places in Turky, the condiment or icasoning for meate, being dryed and made into pointher: the wood is whitiff, which being dryed and ground ferveth to dye blacke withall, as is well knowne

2. Sumach five Rhus Virginiana. Virginian Sumacke.

The Virginian Sumacke groweth up in some places to be a tree of a meane sife whole barke on the body and the armes is rugged, and of a darke ruffet colour, those that are two or three yeare old, are smooth and not ngged, but those of the last yeare are of the same brownish red colour and softnesse, that the new velvet head of the third which is have, (that it might deceive a right good Woodman to fee one cut of and prefented him on the fuddaine, yeelding a yellowish milke, when it is broken or wounded, which in a small time becommeth thicke Meunto a gumme: the long winged leaves grow one above another on both fides of the branches very largely freed, having eight or tenne or more long narrow leaves fet on each fide of a middle ribbe, and one at the end. ray smally dented about the edges, of a darke greene shining colour on the upper side, and paler greene understath: at the ends of the branches come forth long and thicke browne tufts or heads, very foft and woolly in hadling, made all of short threds or thrummes, from among which appeare many small slowers much more red octimion then the tufes, which turne into a number of very red round flattifh feede, thicke and close, fet on the braches of the head together, leffer then the small Lentils, having a small blackish seede, under that outward kinny huske, whose shell is somewhat hard, enclosing a white kernell within it. the roote spreadeth much under tround, shooting forth suckers round about, and a good way of from the body of the tree.

3. Rhus Pliny Mirtifolia. Mirtle leafed Sumacke. The Mirtle leafed Sumacke groweth feldome above the height of a man having many flender branches with laves fet thereon every one of the bigneffe of the broad Mirtle leafe, fet by couples, but not fo closely, or alwayes phoppolite one to another, not fo many together, and not dented about the edges : at the ends whereof come Hhhhhh

1450

forth many small purplish red threds, set upon or sticking out of a small head, one set above another, which afterwards turneth into a sound ar domewhat star crested blacke berrie, containing therein small white and rough seede, somewhat like unto Grape kernels. This in some places dyeth downe to the ground every yeare, and springeth anew, which is the cause it can give no flower, much lesse seede, which never is found on the first yeares shoote in our Country, but in other places of our Land sheweth flowers, such as J have described, but never any fruite that I can learne.

4. Coggygria five Cetinus Coriaria.

Venice Sumacke.

The Venice Sumacke is in some places a tree, rifing to be of the bigneffe of the Pomegarnet tree, in other placesit is much lower, and shooteth forth many twigges, of two or three cubits long, and of the bigneffe of ones finger, divided into many reddish branches, having sundry leaves set on both fides without order, fornewhat broad, round pointed, thicke, and full of veines, and small red footestalkes under them, a little waved about the edges, of a Rosseniike sent, not unpleasant, and of an harfh binding talte, growing to be of an excellent Rose colour, in the end of Summer; from the ends of the branches start forth a large and long head, confifting of many tufes, of whitish greene flowers, standing upon very fine red footestalkes, which aftery ards spread themselves into somany tufts of feather-like haires or threds, having among them fundry small blackish and flat seede, formed somewhat like unto an heart, which together with the filken threds are carried away by the winde : the roote is hard and wooddy, not growing deep nor much spreading the wood is yellowish, and serveth to give a yellow dye; but the

Serecte Ganle.

leaves and young branches, doe Dye a blacke colour; and with the barke they Tanne leather, as with the other, 5. Rhue lybuefirie five Myrem Brabancica ant Anglica. Sweete Gaule.

This other plant which as I fald is fit to be joyned to the rest, is a small low shrub or wooddy bush, not above a yard high, spreading slender branches; with many browne yellowish greene leaves somewhat long, narrow, thicke and fattish, round pointed, resembling both Boxe and Mirtle leaves in some fort, but smelling somewhat strong and sweete, the flowers are yellow, and stand upon short stalkes, comming forthat the joynts with the leaves in small tusts, many set together, which being past, the said stalkes are plentially stored with cornered yellowish seede, bedewed with a clammy mossure, of a very bitter unpleasant taste, but strong sweete sent; the mote is hard and wooddy.

The Place and Time.

The fielt groweth in Syria and Pontus as Calen faith; in Italy and Spaine as Pliny faith, and in divers other places, where it is manured as carefully as their Vines, and as Clufine faith he faw it to ordered in Spaine, which yielded the Owners great profit, the fecond groweth naturally in Virginia, from whence we had it. The third shout Mompelier, and in fundry other places. The fourth in Savoy, and on the Appenine hils and elsewhere. The last groweth in many places of our owne Land, as well as beyond the Sea, as in Suffex, Hartfordfire, and Kent, and by old Windfor Parke corner.

It is called in Greeke four, and by Hippo crates fig., in Latine allo Rhus, for Pliny faith it hath no Latine name shhough Gaza callet hit Fluida supposing the name to be derived from five fluo, but it is rather a rubore vet colore entine action actionrum, and therefore it was called \$10.00. from whence the Latine Ruffus, and the French Rouxe came, his called Rhus simply by some, as Matthiolus &c. Rhus corjaria by Dodoncius, and Rhus observame by Lobel, his called Rhus simply by some, as Matthiolus &c. Rhus corjaria by Dodoncius, and Rhus observame by Lobel, Camerarius, Clussus, and others, and Sumach both by shops and in Ramselsius, or Sumach Arabum, because it was called Rhus syriaca by some, it was thought to differ from the former, as also, that Rhus culinaria and waits or rubra, did differ one from another, and were severall sorts; but Paulus Africa, doth plainely shew that the seede and juyce of Rhus coriaria was used by Physicions: another errous Cellius shewed, that tooke the Rhus Syriaca to be Ros Syriacum, a kinde of Manna, and therefore called it rorem Syriacum; instead of Rhoem Syriacum, and rorem surorium for Rhoen Syriacum, or coriariorium, not surorem surorium instead of Rhoem Syriacum, and rorem surorium for Rhoen Syriacum, or coriariorium, not surorium for disenteries and the like. The second hath not beene set out by any before me, onely Bauhinus seemeth to couch upon it, calling it Rhus Pliny in was brought out from Braffile. The third is thought by most to be the Rhus spring for Pliny, that hath Myrtle like leaves, and so called by Lobel, Dodonasu, and Lugdonashis, and Rhus Pliny she she surpulsated by Pliny is the surpulsation of Theophraffus, which save translateth Prunum, but should be rather union is had have pleinfus and Rhus Pliny in the surpulsation between the Oleaster, which is called Colines she the Cosisium Pliny, and for a distinction betweene it and the Oleaster, which is called Colines the the this Colines of the Cosisium Pliny; and for a distinction betweene it and the Oleaste

5. 7. Myrtus Battica fylvefiru & minor acute folio. The Spanish wild Myrtle and the Small poynted Myrtle.

Hhhhhh a

the Apennine hils doe call it Scotano, and those at the foote Reffele, of the red colour of the batke, and not of the Dye, as fome thinke, because Pliny faith, his Cotinus is, addineamenta modo conchyly colore infigurem, for this as ie Dye, as some thinke, because runy satur, the Common is, manufacture which they loppe and fell for that purpose before said, giverh a yellow colour. The Savoy ars call the wood hereof which they loppe and fell for that purpose Fuster, and we Fusticke, which all Dyers know is of especiall use with them, both the old wood to give enevel. low colour, and the young another. Mathiolus, Anguilara, Camerarius, and Gefner in bortis call it Cotinus, yet Gefner also calleth it Coccigita forte Barba Iovis Pliny, Dodoness Cotinus Coriaria, Coggypria by Clustus and on thers, and of Cesalpinine Scotanum vulgo, as the common people did. The last is liker to be the Rhun spluestrin and called by Lugdimensis, Rhun spluestrin altera, by Clusius Rhun herba Plinin, and thinketh it is the Drophanon Plini also, as Ruelliss did before him, and Myrtus nemoralis, Cordus tooke it to be Eleagnin, and Bellouius firpinm cultura, tooke it to be the Elaagnus of Theophraftus, and Lobel therefore called it Elaagnus Cordi, and Do. donem Chamalaagum, Lobel calleth it Gagel Germanorum, and Myrtus Brahanrica, and Belgarum, but I may fay as well Myrem Anglica, for it is as plentifull with us as with them, but that Lobel did not know fo much? The Arabians call the first Sumac, Adurion, Rosbar, Sadistices, or Rosaidices, the Italians Rhm, and Sumace, the Spaniards Sumach and Sumagro, the French Sumac, the Germanes Gerberhaum, the Dutch Sumack and Smack, and we in English Sumacke, and red Sumacke, the French call the last Pincentroyall, that is Royall Balme: the Germanes G. gel, as is before faid, and we Gaule and sweete Willow. The Vertues.

Sumacke both leaves and feedes, and the medicines made of them are cooling in the fecond degree, and drying in the third, the leaves of the first Sumacke have an astringent quality, that they may serve instead of Acacia, for these purposes it is used, he decoction of the leaves and seede is singular good for all forts of suces in man or weman, to take them in broth or in meate or drinke, and to fit in the decoction while it is warme as the bloody flix, the flux of the flomacke, womens courses, and the whites also, to be drunke or invected by glifters or otherwile, or in bathes, it flayeth the flomacke that is much given to casting, the decoction of the leaves or feede made or in Datties, it hay the tomer that the tomer to the dryed leaves by boyling them in water and a fittle honey put thereto is good against Gangers or Cankers, the juyce that is taken out of the dryed leaves by boyling them in water and after they be strayned to boyle them against with some loney, hath the fame properties that Lycium hath, the fame helpeth the roughnesse of the tongue and throate : the feede likewife boyled in water, and the decoction thereof evapoured to the thickeneffe of honey, is more effectuall then the feede it felfe: the decoction of the greene leaves maketh the hare blacke to be washed therewith: the juyce of them dropped into the eares dryeth up the moisture and running of them: the seede beaten and boyled into a pultis and applyed to any inflammation or hot Impostume, coolerh them much, and doth also take away the markes and paines of bruifes and blowes; as also the frettings and gallings of the skinne, the same also helpeth the hemorrhoides or piles when they bleede too much, if it be applyed with the fine pourher of Oken coales: it is fingular good alfo to be applyed to ruptures, both inwardly and outwardly and to flay defluxions of hot and fhane theumes into the eyes, and Damocrates used it in a medicine with Poppy beads, against destillations from the head, and against want of sleepe; the gum that is found oftentimes issuing out of the tree, is good for hollow teeth, to eate the paines, and the decoction of the feede is good to wash the mouth both to fiften loofe teeth, and to heale purelt and rotten gummes. What the Virginia Sumicke will performe, I have not knowne any bath made the proofe, but it is probable it might worke fome of their effects if any would make the tryall. Both the Myrtle leafed Sumacke and the Visice, are in a manner as effectivall to all the purposes aforesaid, except that they are a little weaker. The Gaule is by the bitterneffe and harlhneffe found to be both drying and discuffing, and is very effectuall to kill the worms in the belly of ftometers it mightily affected the braine, caufing first perturbations and then sopiting the sences it is much used to be laid in Wardrobes, Chests, Presses, and the like, to keepe mothes from garments, and woollen cloathes as also to give them a good sent.

CHAP. XLV.

Myrtus. The Myrtle.

Aving spoken of the Gaule in the Chapter before, which some account a kinde of Mystle both from the forme and sweetenesse, I thinke good to set the stocker of the stocker the forme and fweetenesse, I thinke good to set the stocke of the Myrtles next thereunto, which are many, because although I have shewed you three of them in my former Booke, yet I have not fhewed you all the properties they have.

1. Myrtus latifolia maxima. The greatest open Laurell Myrtle.

This greatest Myrtle hath great and thicke wooddy branches for with a double row of large leaves yet not fo close as the next comming necre unto the smaller leaves of the Bay tree, but of a paler greene colour, abiding alwayes greene and very fweete: this fort faith Cluffe even in Spaine feldome beareth either flowers or

fruite, because they pruine it often being kept in hedges for pleasure.

Clussus maketh another fort hereof, which differeth little from the former, but in the leaves which are somewhat imalier and thicker, whereas the former are thinner.

2. Myrtus latifolia exotica. The strange broad leafed close Myrtle. This Myrtle groweth higher then the former, and shooteth from the roote store of strong thicke stemmes more plentifully stored with large leaves, yet not fully so large as the first fort but closer for together that they almost touch one another sometimes in a double row and sometimes in a treble and very sweete: the flowers are white like unto others but larger, after which commeth the fruite, somewhat longer then in the small forts, greene at the first, purplish before it be ripe, and blacke when it is full ripe, with many crooked white seedes within

3. Myrtus latifolia vulgaris. The usuall broad leafed Myrtle. This usuall broad leafed Myrtle (which I so call because we have this onely in our Country, of all other forts of broad leafed Myrtles) groweth to be foure or five foote high with us, and in the warme Countries to be a little tree full of branches and leaves, like a small bush, the leaves are somewhat large and great, yet not so large as the last, as

TRIBE 16.

fweete as the other, and the flowers white like the reit, and fweete likewife, the fruite hereof is blacke alfo.

CHAP.45.

4. Myrtus angustifolia exotica.
The strange narrowleafed Myrtle.

This narrow leafed fort groweth in all parts like unto the second, but that the leafe is smaller, narrower, small pointed, and of a darker greene colour, the flowers are alike, and to is the fruite blacke also, but greater and rounder, having crooked white seedes in them, as the others have.

5. Myrtus Batica sylvestris, The Spanish wild Myrtle.

This wilde Myrtle groweth neither so high, nor so thicke with leaves, as the former manured sorts, but have slender and brittle branches, with broader leaves then the last, set more thinly on both sides then the rest, and of a darke greene colour: the flowers are like the rest, and the fruite is round, standing on long sootestalkes betweene the leaves in good plenty, greene at the first, and whitish afterwards, and blackish being ripe full of sweetish juyce, pleasant, with some astriction to the taste.

6. Myrtus domestica minutissimis folis fructu albo. The small white Myrtle.

This white Myrtle groweth reasonable tall, with sender reddish branches, thicke bushing together, being thicke set with very small (even the smalled of any other,) leaves, narrowest of any, and sharpe pointed, and somewhat darke greene also: the flowers are white like the rest, and so is the fruite likewise, but of a whitish colour, tending to a little bush, and so abide, not changing blackish.

7. Myrtus minor acuto folio.
The small and pointed Myrtle.

This small Myrtle riseth not so high as the third, or ordinary broad leased fort, but groweth fuller of branches, and thicke set with small fine and greene, almost shining round leaves a little pointed at the ends, abi-

ding alwayes greene, as all the forts of Myrtles doe, which and the flowers are fweete also, but grow not plentifully in our Country on the branches, as in warmer places, and beareth blacke berryes, but never in these colder elimates, how soever housed or defended.

8. Myrtus minor rotundiore folio. Boxe leafed Myrtle,
This other fort groweth in all points like the last, but that the leaves being as small and fresh, greene, thicke
growing, are rounder at the ends, very like unto the small Box leaves, and beareth flowers as sparingly.

9. Myrius sure pleno. Double flowred Myrtle.

Of the greater kinde of Myrtle, there hath beene of later times one noursed up in the Gardens of the chiefe Lovers of rarities, with as double flowers as the double Fethersew, comming forth of a round reddish huske, continuing flowring at the least three moneths, and each flower a fortnight, and is not over tender to be keps, yet is not fo hardy to endure the frosts, as Cornutus saith, which Master Tradescant can sufficiently witnesse, who by

a little neglect loft a good plant overtaken with the froft.

Myrtles of many forts are sound generally upon all the Sea coasts of Spaine, Italy, and in divers other Countries also. The first two sorts (Insue found in Spaine, not growing naturally wilde, but in certaine Monasteries, and private mens Orchards. The third I thinke came out of Italy, because it is most like to that fort they so call. The fourth he likewise found in a Monastery, not farre from Cordaba. The fifth in many places wilde, both of Spaine, and Portagall. And the first in a private noble mans garden in Portagall. The two last save one, are noursed up most frequent in our Land, and better indure therein, with some good heede and looking unto; but generally even in the warme Countries they must be defended from the cold for feare of danger, as Virgil sheweth in this Verse Eclog 7. Dumeener as desende a frigore Myrtos; and Ovid in the like manner saith Mesuentems frigora Myrtom, and yet Virgil in another place saith, Amantes frigora Myrtos; Which how both should be true. I can imagine no other, but that Virgil speaketh of the first in a cold place, and of the other as they grow in a warme, that the cold place must have shelter and defence against the cold, as it is withus, who give them all the comfort we can: and that they that grow in a warme and not Countrie must have shadow, for they love both shadow from the heate, and mosisture in the warme Countries. The last hath no natural place assigned. They shower in Mas, and the fruite is ripe about September.

The Names.

It is called in Greeke pupopuand publin, so called a Myrsine Atheniens puella amica Palladis a qua enssu palastra, superara, invidia dusta interimit; arbuscula in demortue vicems successive; semper ut olea Minervachera; but Pena saith, sic vocatam volume, propter amalam Myrrhe odoris gratiam, in ejus baccis recension; yet when we shew you here a Myrtus sylvestris, as well as sativa, or domestica, you must not understand the Oxymyrsm, that is Bruscu, which some called also Myrtus sylvestris to be it, but as in opposition to the tame or manured of the saine

9. Mystus flore piene. Double florered Myrtle.

kinde. Diojeorides maketh mention of both these sorts, and the white one also, although he hath described bur one: but some doe much mervaile that Theophrastus that doth so often make mention of the Myrtle, yet hath in no place described it. The first fort here set downe is the first Myrtus with Clufius, called by him Myrtus Betica laifslia domestica, and by Lobel Myrtus laurea secunda. The second is called by Clusius, Myrtus Betica latifolia extice. The thirdis as I take it the Italica Camerary, which Matthiolus and others doe describe, and may be the Cuinquila of Cato, which Pliny calleth noftras, that is Romana, and Lobel Laurea maxima, and is most likely to be the miera of Dieferides. The fourth is the Myrem Betica angustifolia exotica of Clugiu, which Lobet calleth Mrism exotica Pliny, and although it have not fix order of leaves, as Pliny his exotica, yet faith Clufius, the leaves only thicke together, that it seemeth to have more then it hath. The sist of Matthiolus. The sixth Series sylve-firis, and is the Myris majorio quinta species of Lobel and Myrius sylvestris of Matthiolus. The sixth is the Myris domestica frue albo of Clusius, which Bellonius often temembreth in his Observations, and is the Myrius nona mufifolia by Lobel. The two last fave one are very likely to be the Tarentina, and so Matthioliu, and Clusius nke them to be. Lobel calleth them Myrus minor vulgaris, and to others, because as I said they best abideour Northerne Countries. The last is so called by Cornutus as it is in the title. The Excressence that is often found Notherne Countries. In that is to called Myridanism and Myriadanism by Dioforrides, and Myriadanism. Yee Play calleth Myridanism, the wine that is made of Myrile berryes. There are likewife, faith Belonism, in his Observations, certaine Coccos, or red berries, like unto the Chermes berries growing upon the Myrtles in many blaces of Tarky, which have in them but one flye or worme, and used as the Chermes to dye withall. The Aralimitall it Aes Alse and As, the Italians Myrto, and Mortello, the Spaniards Murta, and Raiam, the French Myritand Meurtre, other Nations follow the Latine as neere as they can, the Apochecaries and Druggists shops call the berries Myrtillus, and we in English Myrtle berries.

eberries Myrillm, and we in English Myrtle berries. The Vertues.

The Myrtle as Galen faith hath contrary quallities in it, for it hath a passing cold earthy quality in it, and a cermine thinne warme effence also, and therefore it powerfully dryeth and bindeth. The dryed leaves are more dying and binding then the fresh, which being beaten and boyled with water, is good to drinke against caures, falling to any part of the body, and doth helpe also the fluxes of the belly or stomacke, moist alcers, and fitting or creeping fores, being applyed to the fwellings and heate of the cods, the Impostumes of the fundament. and Saint Anthonies fire: the decoction of the leaves is good for the resolution of the Arteries and joynts. and their weakenesse to sit in or over the same, as in a bath, and doth helpe to consolidate broken bones or out of jayat, that will hardly be cured, it helpeth the forenesse of the nayles, and that rising of the skin about them, if the pouther of the dryed leaves be cast thereon: the juyce of the leaves is of the same effects, whether out of the fielh leaves, or taken from the dry, by infusing red Wine on them, and is safely used where there is neede of any binding medicine, or to heale the ulcers of the mouth or privy parts : the same also helpeth watering eyes or blings and paffions of the heart, and to helpe thate the thing of Scorpions, and the bitings of venezous creatures, and of the Spider Phalangium, and the danger of Mushromes: being drunke in Wine, it helpeth a stinking breath, and amendeth that which is not sweete, the same also heated with Wine healeth old ulcers, that are hard to cure : it helpeth the difeates of the bladder, and provoketh urine, it also bindeth the belly, and stayeth the fluxe of humours, the blanes, wheales, and other breakings out in the skinne : the decoction of them, is good for women to fit in or over, that are troubled with the falling downe of the mother, and is good also for the falling downe of the fundament, and the piles. The Excressence called Myridanum, is of greater force to dry and binde then either leafe, juyce, or feede: the juyce condenfate of Myrtles is commended by Matthiolus for a better fubflittle, for Acacia, then the juyce of Sloes, which hath not that aromaticall fent, and strengthning quality that the Myrtle hath.

CRAP. XLVI.

Vitu Idea sive Myrtillin Germanica vel Vaccinium frutex. Whortle betries.

Here are divers forts of these low shrubs, which must all goe under the name of Whorts or Whor-

t. Vaccinia nigra unigaria. Blacke Whortes or Bill berries.

This famili bush creepeth along upon the ground, scarce rising halfes yard high; with divers famili darke greene leaves set on the greene branches, which it spreadeth abroad on both sides, but not alwaies one against another, somewhat like unto the smaller Myrtle leaves, but not so hard, and alittle dented about the edges: a true foote of the leaves come forth small hollow pale blush coloured flowers,

alittle dented about the edges: at the foote of the leaves come forth small hollow pale blush coloured flowers, the brimmes ending in five points, with a reddish thred in the middle, which passe into small round berries of the bignesseand colour of Juniper berryes, but full of a purple sweetish sharpe or sowre juyce, which doth give a sad purple hollow to their hands and lips that eate and handle them, especially if they breake them; containing within them diver small seed: the roote groweth allope under ground, shooting forth in sundry places as it creepeths this looseth the leaves in Winter.

This other Bill berry groweth greater and higher then the former, whose lower part of the branches are of an although the upper part greene and sometimes reddish, the leaves are somewhat rounder pointed, the flowers and berryes, are like the other in all things they that they are larger, but of the same colour being ripe, and of a more pleasant tweete and lesse that they are larger but of the same colour being ripe, and of a more pleasant tweete and lesse that they are larger but of the same colour being ripe, and of a more pleasant tweete and lesse sharper as a super Paintage. Hungarian Blacke Whorts.

This Hungarian Whort hath tough flender stalkes, lying for the most part on the ground, and there taking

TRIBEI6.

1. Vaccinia nigra vulgaria. Blacke Whorts or Ball berri. s.

2. Vaccinia nigra f-ullu majore. The great Bill berry.

3. Vaccinia n'gra Pannonica. Hungarian Blacke Whortes,

4. Vaccinia rubra Buxen folifs. Red Whotees with Boxe leaves.

The Spanith red Whort.

8. Visit Idea Cretica elation
The caller red Whorts of Candy?

9. Vith Idea Creekea humilior. The lower Candy red Whores.

mote againe in some places, with many branches, scarfe raising up themselves above the Mosse, among which it goweth, having sundry long and somewhat narrow leaves, upon long scottalites set without order on them, greene above and paler underneath, and a little nicked about the edges, with a few soft haires on them also, and greene above and paler underneath, and a little nicked about the edges, with a few soft haires on them also, and greene above and paler underneath, and a little nicked about the edges, with a few soft haires on them also which were of a very astrongenerate: the slowers come forth at the end of the last, yeares shootes or branches, which were of a very astrongenerate: the slowers come forth at the end of the last, yeares shootes or branches, which were of a very astrongenerate states. The slowers come slowers when they were ripe but reddish before, full of a not unpleasant juyce, containing within them no stones sown

CHAP.46.

like Cherries but five feedes for the most part, being flat and white: the roote is wooddy with some fibres joyned thereto: this holdeth the greene leaves all the Winter.

4. Vaccinia rubra buxen folys. Red whorts with Boxe leaves.

This red Whort rifeth up like unto the great blacke Whort, having fundry harder leaves like unto the Boxenee leaves, greene and round pointed standing on the severall branches, at the toppes whereof onely, and not from the fides, as in the former come forth divers round and somewhat long hollow flowers, of a pale red colour, after which succeede round reddish sappy berryes, when they are ripe, of an acide and astringent taste: the roote run. neth in the ground like the blacke : the leaves hereof fall not away in Winter.

5. Vaccinia rubra longioribus folys. Red Whorts with longer leaves.

This other red Whorte is like a low creeping shrub, but groweth somewhat thicker and greater then the former red, the leaves whereof are longer narrower and sharper pointed then it, and growing reddish toward Annune. but yet abiding on the branches like the former, and not falling of in Winter: the flowers are like the other, and fo is the fruite, but not sappy, or with juyce therein, but dry and saplesse, and without any manifest talte.

6. Uva ur si Galeni Clusio. The Spanish red Whort.

This Spanish Whort likewise differeth not much from the former red forts, having stender flexible stalkes and branches, about a foote long, lying on the ground, covered with a reddish barke, somewhat like unto the tender branches of the Strawberry tree, having fundry leaves fet thereon, neere refembling the Strawberry tree leaves but leffer, being thicke and sappy, but not hairy at all, and somewhat bitter with the astringent taste: at the tast of the branches grow divers bottle like or hollow round flowers, growing in clusters of the same whitish blush colour that they are of, after which follow round red berries like unto small Cherryes, but of an acide taste : the leaves hereof likewise abide on the stalkes and fall not away in Winter.

7. Vitis Idea tertia Clufij. The French honey iweete Whortes.

This rifeth higher then any of the former, to be foure or five cubits high, with fundry thicke smooth wooddy flemmes from the roote, the lower parts being somewhat rough and covered with a blackish barke, theupper branches being greene, stored with many leaves thereon, set without order, which are somewhat long with the roundnesse, and a little dented about the edges, of a fad greene colour above and very hoary underneath; at the joynts with the leaves come forth many white flowers, confifting of five leaves a peece, after which come fmili round berries somewhat bigger then Hawthorne berries, and blacke when they are ripe, having a small crowne as it were of five small points which were the flowers, sticking at their toppes, and being sappy of a sweetish taste like honey, with fundry blackish seede within them.

8. Vitis Idea Cretica elatior. The tallor red Whortes of Candy.

This small shrubby plant lending forth fundry slender wooddy blacke shootes from the roote, the wood being hard and white without any fent, but somewhat heating the tongue on the talking, parted into divers branches, furnished at the joynts, by unequall spaces, sometimes with single leaves, but usually with two, and sometimes with three or four together, which are fomewhat hard and almost round, dented also a little about the edges, being formewhat like unto Holly, but nothing fo hard or prickely, of a fad greene colour on the upper fide and gravish the lower, at the ends of the branches, and at the joynts also with the leaves come forth sandry white Cherrylike flowers, each on a long footestalke, and after them small round and somewhat long reddish fruite, of a pleafant tafte, of the bigneffe of a Beane, having a freezy or woolly crowne at the toppes, and being dry turneth blacke

9. Vitis Idea Cretica humilier. The lower Candy red Whorts.

This other Candiot groweth much lower, fuller of sprigges stenderer also and shorter whereon at unordinary spaces, stand unordinary leaves, three or foure sometimes together, being almost round like unto the last, but leser fofter, imoother and not lo much dented about the edges, neyther yet of fo fad a greene colour on the upperfide, nor fo gray on the under, at the joynts likewife with the leaves come forth long stalkes, with many the like white bloffomes in a cluster, turning into smaller berries, of a darke red colour, and a little downy at the head, somewhat like unto Mirtle berries, which are familiarly eaten by the Shepheards, and others of the Country. The Place and Time.

The first groweth in many heathes, woods and barren hilly places of this Land, as Hampfleede Heath, Fincheley, and Saint Johns wood, not farre from London, and in fundry other places. The first red fort in the North parts, as Lancasbire, and Torkesbire, on the hills, &c. The rest grow in Hungaria, Bavaria, and Germany, and in other Countries also. The fixth Clusius found in Spaine, and the branches and berries were shewed me by Boel, that brought them out of Spaine. The seventh groweth as Lobel faith on every of the hils in Provence of France, and Clufius on the hils nigh Vienna. The two last in Candy. They all flower in March and Aprill, and the fruite of the blacke is ripe in Inne and Iuly, the other later.

The Names. The first blacke forts are taken generally by the best later Writers, to be the dumid megidus of Theophrasiu, that is, Vitte exparte Ide, quam vocant Phalacras, but Pliny falsiy put in Alexandrina instead of Idea, in Latine by them Tiris Idea Th ophraft, and because all the rest have a resemblance thereunto, they are all called Dires Idea, likewise, with their severall distinctions, as you shall presently heare : they are many of them also called Vaccinia, by divers, thinking the black fort to be the Vaccinia nigra of Virgil, & by the transposition of a letter Baccinia nigra parva quasi bacca; but that errour is exploded by many good Authours, that shew Virgil putteth his Vaccinia among flowers, and not fruites; for as he saith, Et sant Violenigra, & Vaccinia nigra, intending the colours were both alike, as a kinde of Hyacinib, which he might meane is as the Violet flower. Virnuism and Pliny indeede have a Vaccinium which giveth a purple dye to servants or others garments, which may very wel be this, for such a purple colour will the juyce hereof give if it be rightly ordered. It is also called Myrtillus, and by some Myrtillus Germanica, because the Physicions and Apothecaries in Germany and those parts, tooke them to be true Mircle berries, and so used them untill they were shewed their errour, and since have fortaken it, as we have done also. Gefner also in hortis sheweth, that some did take the Vitis Idea, to be that Vine that beareth Currans, but faith he, that noble Vine groweth not on so high or snowy mountaines, but rather in the Planes and open hils, and ordered by the industry of men. The first Tragus calleth Myrillus exigus, and so doe Matthiolus and Lugduneus.

The Theater of Plants. TRIBE 16.

man and Lobel, called it Feetinia migra, Angustara, radix Idea fruttu nigro, Camerarino, Gefmer and Clusius, più Idea unitembre baccie nigrie Cafalpinus Bagola primum genne. The second is called by Tragio, Myrithia grandus, and is the First Idea major of Thaline, the Vitu Idea secunda five altern of Classin, and the Utin foly; surrounais malbidis, although he hath transposed some of these titles to his second, which is my third whereof onely Change maketh mention and calleth it his first, and Gerard, Vaccinia Pannonica, and Banhimus calleth Vist Idea jois; obserte dicantibus. The fourth is called Vaccinia rubra, and Vitis Idea rubra, by all writers thereof : Camerarim and Thatim fay that some tooke it to be Rhun minor Pliny; and Cluffen Vitis Idea buxen folins, and Anguilaya Radix Meafratin rubro, as he did the blacke before, Radix Idea frutin niero, and Lugduner fis doth thinke that this is most properly the Radix Idea of Dioscorides. The fifth is mentioned onely by Camerarisis in horte, who calleth Win Idea rabra Bavarica. The fixth is referred by Clufius to the apansalound of Galen in his leventh Booke, de composit, med fecundum locor, cap. 4. and thereupon he called it Uva weft Galeni, Banhinu retereth it to the Vitte iles. making it his fixth and calleth it Idea radix Diofcoridis alfo. The leventh is called by Clafius Vitin Idea ternot thinking his former to be fo worthy of that name, Lobel faith the French call it Amelanchier, and doubtthis it be not that thrub which they call Ai for, Bellonins faith, that their Alelanchier is called in Candy Agricules and Codemalo, but I thinke he is deceived, that having blacke, and this red fruite: Gefner in his Epittes, as Clusius faith (if he meant this plant) giveth it divers names, as Myrtomalis, Petromelis, Pyrus Cervina, and Pyras wo Idea. Dalochampine taking it to be Coconaster Gesneri, calleth it Epimelia altera, but givethit red betries, which therefore I suppose may be rather one of the two last. The two last are mentioned by Alpinus, in his Booke of Froticke plants, by the name of Corafas, and Chamecerafus Idea Cretica, thinking the former most neerely to with Cerafus Idea Theophrafti. The Italians didule to call the first Miritle, but now Vite Idea, according to the Latine, the French Airelle and Aurelle, the Germanes Heidelbeer, the Dutch Crake besten, and we Whorts or Whortle berryes and Bill berries with us about London? The Vertues.

The Bill berries doe coole in the second degree, and doe a little binde and dry withall: they are therefore good ishot agues, and to coole the heat of the stomacke and liver, and doe somewhat binde the belly, and stay castings, and loathings, but if that they be eaten by those that have a weake or a cold stomacke, they will much offend and mobble it faith Camerarius, and therefore the juyce of the berries Leing made into a Syrupe, or the pulpe of them mide into a conferve with Sugar, will be more familiar to fuch, and helpe those paines, the cold finite procured, and is good for all the purpotes aforefaid, as also for those that are troubled with an old cough, or with an ulcer in the Lungs or other disease thereof: with the juyce of the berries Painters to colour paper or cards, doe make a tinde of purple blew colours, putting thereto fome Allome and Galles, whereby they can make it lighter or fad-dens they please. And some poore folkes as Tragus sheweth, doe take a possull of the juyce strained, where-mo an ounce of Allome, soure spoonefuls of good Wine vinegar, and a quarter of an ounce of the waste of the copper forgings, being put together, and boyled all together, into this liquor while it is reasonable, but not too hot, they put their cloth, wooll, thred or yarne therein, letting it lye for a good while, which being taken out and angup to dry, and afterwards washed with cold water will have the like Turkie blew colour, and if they would have it sadder, they will put thereto in the boyling an ounce of broken Gaules: Gerard saith, that hee hath made of the juyce of the red berries, an excellent crimion colour, by putting a little Allome thereto: the red Whorts se taken to be more binding the belly, womens courses, spitting of blood, and any other fluxe of blood or hu-

mours, to be used as well outwardly, as inwardly.

CHAP. XLVII.

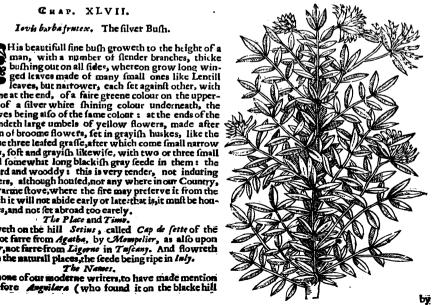

Iovis barba fratex. The filver Bufh.

bushing out on all sides, whereon grow long winged leaves made of many small ged leaves made of many small ones like Lentill leaves, but narrower, each fet against other, with modde one at the end, of a faire greene colour on the upperide, and of a filver white thining colour underneath, the joung leaves being also of the same colour: at the ends of the mich standeth large umbels of yellow slowers, made after befashion of broome flowers, fet in grayish huskes, like the badsof the three leafed graffe, after which come small narrow bott pods, foft and grayish likewise, with two or three small lound, and somewhat long blackish gray seede in them: the note is hard and wooddy: this is very tender, not induting Winters, although housed, nor any where in our Country, in a warme stove, where the fire may preserve it from the old, which it will not abide early or late: that is, it must be houbetimes, and not fet abroad too earely.

The Place and Time.

Itgroweth on the hill Setins, called Cap de sette of the mich, not farre from Agatha, by Mempelier, as also upon Man niger, not farre-from Ligerne in Tuscany. And flowreth May in the naturall places, the feede being ripe in Inly.

The Names. linde none of our moderne writers, to have made mention med, before Anguilara (who found it on the blacke hill

by Ligeurne, as is before faid, and in his first kinde of Barba Iovis) fince Play, who speaketh thereof tib. 16c. 18. that it shunned the waters, and was called Iowin Barba, and was fit to make hedges and border up beds, to be framed into any worke in a Garden, and Cafalpinus fince him. Camerarius onely nameth it, and so doth Classes, but Into any worke in a Gaudingana and in his Pinax, and all of them by the name of Barba lovin, and yet the Sedam majus, great Houselecke is also called by that name, but to put a distinction betweene them, this is called Barba lovis arbor or frutex.

The Vertues:

There is nothing extant of any Phylicall property, whereunto this plant may be applyed, and therefore thus much shall be sufficient untill the Vertues bebetter knowne.

CHAP. XLVIII.

Periclymenum five Caprifolium. Woodbind or Hony Suckles.

E have divers forts of plants under the name of Periclymenum, fome that are winding about whatforeer f standeth next them, and for the mest part knowne throughout the Land, others are strangers, or not so well knowne: there are likewise diversthat winde not, but stand upright, which I would separate in funder as Bauhinus doth, but not make them kindes of bastard Cherries as hee doth, but joyne themin name, although I disjoyne them by Chapter, both because they have notable differences, and that I might not trouble you or my felfe with too many forts in one Chapter.

1. Periclymenum Que Caprifolium vulgare. Our ordinary Woodbinde.

Our common Woodbind is well knowne to grow up with a wooddy stalke and branches, winding themselves, yet without claspers, to stricktly unto what foever branch of any other tree, that it leaveth an impression therein of the winding, fet with fundry leaves by couples, which are fomewhat broad and long, round pointed, and of a whitish greene colour above, and more whitish underneath: at the toppes of the branches come forth many long and hollow whit h and yellow flowers, laid open before, with many finall threds flicking in the middle of them. of a fine (weete fent after which succeede small bunches of red berries, wherein is contained small hard seede: the roote is wooddy with many fibres.

2. Periclymenum sive Caprifolium Germanicum store tubello. The Germane red Honisuckle. This Germane fort groweth higher and larger spread then the former, but ramping in the like manner, with

the like leaves, but somewhat larger as the flowers are also, being red in the bud before they be blowne open, and continuing reddish on the outside, the bottomes of the flowers being wholly white on the inside.

3. Periclymenum perfoliatum sive Italicum. Double Woodbinde or Honisuckles. The double Hony suckle groweth in the same manner as the other, but spreadeth more and farther, with whitish ramping branches, and such manner of whitish greene leaves fet on both sides of the branches up to the tops,

1. Periclymenum five Caprifolium vulgare.
Woodbinde or Honyluckles.

1460 CHAP.48.

encicbeareth many flowers, at two or three feverall one above another, with two round leaves under at the joynts joyned fo close together, that they like fawfers to hold the flowers, which stand in the wile, and are of the same fashion and colour with the that is of a whitish yellow colour, with open sinces, dasht over with a light shew of purple, with sad within them likewise, and as sweets: this beareth sed likewise, but not so many together.

4. Chamapericlymenum.
Dwarfe Hony fuckle.

This Dwarfe Hony suckle hith a creeping roote, runthere and there underground, and flooting up stakes and fundry leaves. Set by couples at the joynts, full of gines, and with five ribs running all the lenth of the leafe mbeend, which is pointed, fmooth and not dented about tredges, from the toppes of the falkes grow forth two baches, with foureor five fuch like leaves as grow beand from betweene the foote of them commeth a infr of flowers, (which were not observed) and afinthem many red berries fet in a bunch or knob together, Bethe Mulberry, but longer, and therefore I thinkeit sald rather pertaine to the family of the Chamamori, but Clufing to thew, not only his love to Doctor Penny, alenting it passe by his name, but also his judgement betof by the name, to I, untill I can have better knowthe of the Plant, must let it to passe, but with my cauti-

The Place and Time. Thefull groweth every where in this Land, in the hedmabundantly. The second in Germany. The third in My Spaine, Provence of France, orc. Both it and the fecond stonely kept in our Gardens, or Orchards, or let against shoule fide to runneabout the Windowes, where they metheroomes coole and make a goodly flew without. It last was found by Doctor Penny, as Cinfins faith, by

Smisick, who gave him both the figure and the descrip-mass it is hereexpressed. The first is in slower in Inne, and the stuite is ripe in Angust. The second and third mearlier, both for the flower and fruite, yet we never faw fruite of the fecond to follow any of the flowers.

The Names. It is called in Greeke weptendusers, but the Greekes in these dayes, westernotes, in Latine Periolymenum also, and urifolium, but Pliny mistaking the word Periolymenum, setteth downe the properties of Clymenum for it, with the Marifylva, Volucium majus, and Lilium inter spina, and Vinciposeum by Casalpinus, according as his Italinulled it. The first and third are called by all Authours that have written of them, either Periclymenum or confolium, some entirle the first Germanicum, and some unigare Septentrionalium, but the second is more righthumed Germanicum, because I thinke no Country h thit naturally but that. The third is Perfoliatum alterum, gunding & Italicum. But the last was first let out by Clufius, and trom him Tabermentanus, Gerard, Baubinus, mmy selfe have it. The Italians call it Vincibosco, the Spaniards Madresella, the French Chemrefneille, the Germil Goff blade, and Speck gilgen, the Dutch Chercenblade, and Memmekens, and we in English Wood binde, and ouvluckle.

Wein our Land have by tradition continued to long in this errour to ule the leaves, and flowers, in all gargles; ad lotions for inflammations in the mouth, or the fore privy parts of main or woman, that I thinke the cultome is powne too ftrong by time for me with a few words to shew the inconvenience, that it may be reformed, for they maither cooling nor binding, as they are taken to be : but are of a clenting refolving confuming, and digetting with as Hystope, O igamum, and Winter Sayoury are, that with Figges and Licoris, are effectuall to expecto-wing me from the cheft and lungs, wherewith they are filled: and that it is not fit to be used in inflammations tray take of the herbe holding a leafe in ones mouth will declare, by the burning heate will be felt therein, and Discordes and Galen say, that the decoction thereof being drunke fixe dayes together, will render the arme thood: although at the first they will but provoke urine onely, the fruite and leaves as well as the flowers, are seeffect: but the flowers and leaves are of more use then the seeds, which is faid to consume the spleene, and spoure a womans speedy delivery, but whereas it is said to bring barrennesse to men that use it it cannot promybefaid of men, but of women to be barren, and of men to be unable to generation, or their feede unprofitatwon fundry causes: the leaves or flowers in pouther or the distilled water of them, is much commended to kand dry up foule and moilt ulcers, and to clense the face and skinne from morphew, sunburne, freckles, and and dry up rouse and mont theers, and to clear the flowers have beene infuled and funned, is good against a discolourings of the skinne. The oyle wherein the flowers have beene infuled and funned, is good against ps, convultions of the finner, and palifes, and any other benumming cold griefe. The double Honyfuckle may by be used to all shese purposes, when the other is not at hand,

CHAP, XLIX.

Periclymenum retium. V pright Woodbinde of Hony suckle.

F this kinde of Periclymenum, there are three or foure forts, as you shall presently heare.

1. Periclymenum ressum frusturabre. Red berryed uptight Honysuckie.

The divers stalkes of this Hony suckle, are somewhat straight and upright, about three or some foote high, at the least, divided and spread into divers branches, covered with a very thinne whi tiff barke: the leaves stand by couples on the branches and two likewise at every joynt, which are of a whitilh greene colour, smooth, and lester then those of the former winding Woodbinder

the flowers also stand by couples at the end of short stalkes, that come forth from the joynts with the leaves, and are much smaller then the other, and never opening or spreading much, of a pale whitish colors, after which come two red berries, long with the roundnesse, both of a bignesse in the natural places, and in some open places. and feldome to with us for one is ufually withered and never comment to perfection.

2. Periolymenum rellum frullu nigro. Blacke berried upright Honysuckle. This groweth not so high as the first, nor spreadeth so much but groweth greater in the stemme and more up right, whose barke is not so white: the leaves grow in the same manner, but are somewhat longer and denad about the edges, the slowers stand upon small stalkes, as in the former, two usually together, yet sometimes but one, of a more purpliff colour, and fomewhat letter, unto whom facceed blacke berries, full of jayce, of no make. fant tafte: the roote in both are hard and wooddy.

3. Periclymeno rectum fructu caruleo. Blew berryed upright Hony suckles. This is also a low shrubbe rising not much higher then the last, the stemme being greater and covered with a rugged blackish barke with divers small branches thereon, the youngest being reddish at the first, and hoary with all: the leaves stand by couples as in the rest, somewhat like unto the first, of a drying and bitter taste, the flowers grow by couples, small and pale of colour, as the first, after which commeth but one berry usually, somewhat lone and round, of a blewish colour with a sweete and little tart juvce within them, colouring the hands red that handle them, and have within them many flat seede.

e them, and have within them many new took.

4. Periclymenum rettum fruith rubro singulari majore. The greater upright Honystickle.

The leaves hereof are greater then any of the former, and pointed at the ends, set in the same manner by couples, on the low stalkes, that are not above a cubit high, and they are harder in handling, greene above and gray underneath: the flowers stand by couples as in the rest, and are of a purplish white colour, or somewhat deeper some. times but unto them succeede but one berry, the biggest of them all even as large as a cherry, red, sappy, and transparent, having two markes at the top, where the flowers grew, but containing within it but one seeds.

> 1. Periclymenum rellum frullu rubra. Red berryed upright Honyluckle.

Blacke berryed upright Honyluckle.

The

3. Periclymenum reflum frastu carules.

Blew berryed Monysuckle.

4. Periclymenum reclum fructurubro fingulari majore. The greater red upright Honyluckle.

The Place and Time.

All these forts were found by Clasim in Germany, Austria, and Syria, and some on the Pyrenean hils, and in Savor, the most of them are kept in our Gardens, they flower in May, and the fruite is ripe in August. The Names.

Some have called these shrubs by the name of Xylostenm quasi Lignum of sum ob duritiem, for they have not been knowne to the ancient Writers, as it is supposed, but found out by the moderne, and for the resemblance of the flowers, in likemesse although not in bignesse, unto Honysuckles, and that the shrub groweth upright, not leamag or winding as the former kindes doe, they have given them the name of Periclymenum stans or relium, as the finest Epithite to demonstrate them, and each with distinctions one from another, as is fittelt. The first is the Priclymenum Allobrogum of Lobel, and Periclymenum rettum frutta rabro, and the first with Clufiu, and Xyloftewww.with Dodonaus, Camerarius, and Thalism : Gesner in horsts calleth it Periclymeno cognatus frusex, and Tragus, and Lanicerus in the infancy of Herbarisme, not knowing whereunto well to referre them, called it Halimm. The second is the second Periclymenum retium of Clusium, and so is the third here, his third in his History of Plants. The last in Clusius his fourth Periclymenum rettum, which Gesner at the end of Cordus, his history of Plants, calleth Chamecerafes mentana, and Lobel Chamacerafus Alpigena, Dodonaus and Eystetensis Xylosteum alterum, Lugdunensis taketh it to be the Fiem Idea Theophrasti, lib. 3, e, 17. and calleth it Fiem Idea nostras valgo Frangula, but Clusius shith, he cannot consent to that opinion, nor that it should be Pliny his Fieus Idea neither, Clusius saith, that they saith, he cannot consent to that opinion, nor that it should be Pliny his Fieus Idea neither, Clusius saith, that they of Angria and Styria call the first Hunds kirschen, and Bein boltz, and the three first forts Hunds beer, and we according ding to the Latine name, upright Honysuckle. Baubinu calleth all these forts by the name of Chamacerasus, whereof many eoe much marvell, feeing the fashion of flowers declare plainely unto what stocke of right they we to be referred.

The Vertues.

There is no one that hath shewed these, that hath heard of any property of any of these betries or the shrubs, have in Physicke, but those that are pleasant are eaten oftentimes, and the third fort is much sought after, by the people where it groweth, to ferve the Dyersuse.

TRIBE 16.

CHAP: L:

Gelseminum sive Iasminum. The Iasmine or Gelsemine.

Erapio hath exhibited unto us in his workes, three forts of Iasmines, with white, blew, and vellow flowers, whom Tabermontanus and others doe follow, although without all knowledge of them:
divers others much doubting the truth of the blew and yellow, flave thought none such to be in rerum natura, but time and industry, the disclosers of hidden secrets, have brought them to light, yet very lately, and fearfe knowne to our world, or therein but to a few; the true yellow I will firm

you in this Chapter, with divers other rare ones, fome true, and fome that are received for latimines, with divers others, and in the next, that yellow Insmine, which formerly was taken for the right, but farre differing therefrom, faving onely in the forme of the flowers, and in the next Chapter unto that, the true fort of Serapio, his blew Isom, laving ones, in the leaves of the growing thereof is not answerable to the Isomines, but more corresponding to the Isomi pondent to the Lilac, besides the Persian name whereby it came, although many of the seaves thereof resemble a laimine, I have placed it there, not without reason as I take it.

. Gelseminum vel Iasminum album vulgare. The ordinary white Iasmine.

The ordinary white Ialmine hath fundry very long shootes from the rootes, sometimes twelve, yea twenty foote high: divided in many branches, covered with a darke grayish barke, the younger branches being greene with a white pith within like the Elder, whereon are fet at feverall places, long winged darke greene leaves, made of many small and pointed leaves, and the largest at the end, and longest pointed; at the toppes of the young branches, stand divers flowers in a tust together, each on a long greene stalke, which sustainesh a small long hollow truncke, ending in five white leaves, pointed and imelling very ftrong and iweete, which fall away without bearing any fruite in our Country, but in the hotter where it is naturall, it beareth a flat seede like a Lupine: the roote foreadeth much and farre in the ground, and giveth many fuckers,

2. Gelseminum vel Iasminum Catalonicum simplex. The single Spanish Iasmine.

This Spanish Iasmine groweth lower then the former by much, but hath leaves and slowers growing in the fame manner, and differeth from itonely in the leaves, being fomewhat broader, shorter, and thicker, and in the flowers which are larger, and purplish on the outside, before they be open, and white with purplish edges, when they are blowen open exceeding tweete of smell more then the former.

3, Gelseminum vel Iasminum Catalonium multiplex. The double Spanish Iasmine.

This kinde of Spanish Iasmine groweth very like but lesser then the single kind shooting forth such like leaves, but of a fresher greene colour: the flowers likewise stand at the toppes of the branches, many together, but the hollow trunckes are shorter by the halfe ending in five or six leaves laid open like a starte, within which rise three

I. Ge'feminum vel Infainum a'bum vulgare, The ordinary white Lafmine,

2. Gelseminum vel Iasminum Catalonicum proplex, The fingle Spanish lasmine.

offive dayes, yet withering upon the stalkes fall not away, but after many dayes to abiding, another slower will beake forth of the fame trunke fometimes : this bath a quicker fent then the other.

4. Gelseminum five Iasminum Indicum flavum odoratissimum. The Indian most sweete vellow Iasmine. This rare Iasmine riseth in the warme Countries to be two or three cubits high, the barke whereof is smooth? and as red or purple as the Flower-gentle, ipreading forth branches on all fides even from the lowest almost, and

they againe divided into other leffer ones, bearing at fusdry places, without order in fome places, three waves, in some five on a stalke, of a very sad or deepe hining greene colour, not dented at all about the edgamen falling away in Winter, each part whereof is fonewhat like the leafe of the Pomgarnet tree, but barder and thicker, the flowers grow in the fame manner at the toppes of the branches, and in tufts, formed very like unto those of the Spanish Iasmine, but somewhat leffer, yet abiding longer, and of a faire gold vellow colour, and exceeding fweete, after which forced small round heads lesser then Ollives, greene at the first, and blackish blew being ripe, cleere, shining lifo like a grape, flanding fingly, and fomer imes dou-bleupon a flalke including certaine blackifh long feed like Peare kernels. This plant is more easie to be propagated, either by fuckers or layers, but is very render to keepe, not abiding either the least of Winters breath nor yet the cold Autumne dewes, but much delighwith in warmth and moisture, yet neither enduring much raine or watering, to fall on his leaves or flowers which will change the flowers paler, and the green leves vellower, and therefore mult have the moilture diffilled at the rootes. This holdeth the greene leaves in the Winter.

5. Gelseminum sive lasminum luteum odoratum Virginianum scandens & semper virens.
